The Mining and Scientific Press--Ever Onward.

Our careful system of compiling, judiciously condensing, and conveniently arranging into regular departments, has been heartily endorsed. It renders the paper worth more to readers, who can find handily that which interests them most.

The weekly issues of the PRESS will contain reliable

Information for Practical Miners,

Treating on the Opening of Mines; Mining of Ores; Milling of Ores; Smelting of Ores; Separation and Roasting of Ores; Amalgamation; Saving of Gold and all precious Metals; New Processes of Metallurgy; New Discoveries of Mines; Mining Engineering and Hydraulics.

For Inventors, Mechanics and Manufacturers.

All new and important developments in Scientific and Mechanical Progress; Patents and Inventions of the Pacific States; Progress of Home Industries; Hints for Local Manufacturers; Illustrations of New Machinery; Reports of Popular Scientific and Industrial Lectures.

Our Mining Summary

Gives the progress of mining work from week to week in the various counties and districts throughout the principal mining regions of the United States, arranged in alphabetical order. It is the most extensive record of mining operations published in the world. It affords the intelligent miner a rare opportunity to know and profit by the work and experience of his neighbors. Miners have few sources of practical information in their calling, and should embrace every reliable means for improvement. Mining Operators and Shareholders, at home and abroad, weekly examine our Summary with increased interest and profit.

Our "Domestic Economy"

Embraces new and important facts which should be known in every cabin and household. Short and interesting—the articles under this heading are freely read and practiced with profit and improvement to the readers.

The PRESS is not strictly a "paper for professional scientific men," but rather a

Liberal and Popular Scientific Journal,

Well calculated to make practically scientific men from our intelligent masses. This is our stronghold for accomplishing good. Plain, correct and pleasing language, easily comprehended by all, confined mostly to short articles, is our endeavor.

For Self-Improvement,

Every issue of the PRESS abounds with articles of an elevating character, to stimulate the higher virtues and natures and progressive intellects of both men and women.

Hundreds of Dollars

Are oftentimes saved to the readers of this paper by a single hint or article of information in its columns; such instances have been repeatedly reported to the editors and proprietors during their long connection with the PRESS. Our paper presents

The New and Novel Developments

In the progress of this comparatively new section of the Union (but recently settled and now rapidly increasing with a population of the most intelligent and venturesome people, attracted from nearly every quarter and clime on the globe), enables us, with our enterprise, to display vigor and freshness in our columns not met with in similar journals elsewhere. The same circumstances also render such a paper more especially valuable to its readers in a new, and, to a certain measure, untried field, where the best methods and processes of industry are not so well established or traditionally known as in older communities. Published experiences often save costly experiments and disastrous results.

A Great Variety of Industrial Information,

In brief and fresh form, suited to the wants and tastes of the readers of this coast, which is not obtainable otherwise so timely, or in so cheap and convenient form. As an industrial publication, meeting the wants of so many kindred industries, this journal stands pre-eminent and without a precedent.

Subscriptions payable in advance—$4 per annum. Single copies, post paid, 10 cents. Address

DEWEY & CO.,

MINING AND SCIENTIFIC PRESS and PACIFIC RURAL PRESS Office, 224 Sansome St., S. F.

THE NEW U. S. MINING LAWS.

The new Laws of 1872, governing the location and purchase of Placer and Quartz Mines and Agricultural Lands in Mining Districts of the U. S., printed in circular sheet, for sale at this office. Sample copies, 25 cts

Thursday Noon our last forms go to press. Communications should be received a week in advance and advertisements as early in the week as possible.

To Mining Secretaries.

An amendment to Section 336 of the California Code, taking effect **July 1st, 1874**, provides that in addition to the regular publication of the assessment and sale notices as heretofore,

PERSONAL NOTICE

Must be served as provided in the following quotation from the law:

"The notice must be personally served upon each stockholder, or in lieu of personal service, must be sent through the mail, addressed to each stockholder at his place of residence, if known, and if not known, at the place where the principal office of the Corporation is situated."

The above refers to the ASSESSMENT NOTICE only. Advertisers in the MINING AND SCIENTIFIC PRESS will be furnished with copies of assessment notices printed on slips suitable for serving personal notice under this law at short notice.

DEWEY & CO., Publishers.

June, 1874.

Mining and Other Companies.

Black Mountain Coal Mining Company.

Principal place of business, City and County of San Francisco, Cal. Location of works, Santa Cruz County, Cal.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 28th day of August, 1874, an assessment of 5 cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold and silver coin, to the Secretary, at his office, No. 402 Montgomery street, San Francisco, Cal.

Any stock upon which this assessment shall remain unpaid on the 5th day of October, 1874, will be delinquent and advertised for sale at public auction, and unless payment is made before, will be sold on Monday, the 2d day of November, 1874, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

F. H. WELLS, Secretary.

Office—No. 402 Montgomery street, room No. 23, San Francisco, Cal. sep5

Improved Cast and Forged
STEEL SHOES & DIES FOR QUARTZ MILLS.
[PATENTED MAY 26TH, 1874.]

To Superintendents of Quartz Mills and Mining Men Generally.

We guarantee these SHOES and DIES to do the work of four sets of iron and to be at least 10 per cent. cheaper. They are gradually coming into use in all of the principal mills on this coast.

Their advantages over iron are cheapness on first cost, increased crushing capacity, time saved in changing and in setting tappets, increased value of amalgam by absence of iron dust and chippings, and a saving of 75 per cent. in freight. They possess a similar superiority that steel rails do over iron rails. It takes 40 days to fill orders from the manufactory East. Price 20 cents per pound shipped at San Francisco. Terms liberal.
Address all orders, with dimensions, to
CAST STEEL SHOE & DIE CO.,
Room 1, Academy Building, San Francisco.

Machinery.

BALL'S
SWEEPING DREDGE,
A NEW AND VALUABLE
CALIFORNIA INVENTION,
Has been very lately well proven by performing a job of dredging at the mouth of San Antonio Creek, at Oakland, Cal.

There is but this one machine that has ever had these improvements employed. It is an old machine, formerly built for another device, and is unfavorably constructed for Ball's improvements; yet this first temporary experimental machine has filled a scow of eighty-five cubic yards in sixteen minutes in unfavorable digging. For durability, digging hard material and fast work, it has a reputation (supported by leading engineers) as having no equal.

Testimonials and references will be given on application to the inventor, who is the sole owner of patents (excepting having made an assignment of the one machine now belonging to the Central Pacific Railroad Company). Having resolved not to sell any rights unless upon a *basis* of actual work performed by a machine built by myself for the purpose of fairly establishing the worth of the invention, I therefore offer to sell machines or rights on the following plan, which is warranting the capacity of the machine by actual work:

I will enter into an agreement with any responsible party to build and sell a machine, scowe and tender, all complete, and right of all my improvements in dredging machines throughout the Pacific Coast for $20,000, warranting the machine to dredge six cubic yards per minute (to fill a scow at that rate). $20,000 will but little more than pay the cost of building the machine, scows, etc., all complete; therefore I am proposing to ask *nothing* for my patents unless my machine dredges more than six cubic yards per minute. But it shall be further agreed that in case (at a fair trial to be made within a stated time) the machine shall fill a scow at the rate of more than six cubic yards per minute, then $10,000 shall be added to the price above stated for each and every such additional cubic yard thus dredged per minute, and for additional fractions of a cubic yard thus dredged in the same ratio the $10,000 is to be added to said price above stated.

I will sell any other Territorial or State rights (either United States or Foreign) upon the same plan and at a lower price proportionately than the rights for the Pacific Coast.

I will sell a single machine with scows and all complete, and right to use the same in a limited territory, for $20,000 on the same plan as above stated, but will add only $2,000 to each additional yard over the six cubic yards per minute. Each machine is not to employ more than two 10x20 inch engines.

Payments to be made in U. S. gold coin on delivery of machine, as may be indicated by agreement.

Address, JOHN A. BALL,
9v28-tf Oakland.

STEEL SHOES AND DIES
FOR QUARTZ MILLS,

Made by our improved process. After many years of patient research and experiment we have succeeded in producing STEEL SHOES AND DIES for QUARTZ MILLS, which are unequalled for *Strength, Durability, and Economy.*

Die.

Shoe.

Will wear three times longer than any iron Shoes

BUILDERS AND CONTRACTORS

Of Quartz Mills, Pans, Separators, Concentrators, Jigs, Hydraulic Rock Breakers, Furnaces, Engines, Boilers and Shafting, and general Mining Machinery in all its details and furnishers of Mining Supplies.

All orders promptly filled.

MOREY & SPERRY,
88 Liberty street, N. Y.
Examination solicited. 9v28-1y

CROCKER'S PATENT
TRIP HAMMER QUARTZ BATTERY.

This machine, complete, weighs 1,500 lbs. Has an iron rame, fiya steel arms with stamps weighing 17 lbs. aach, which atrika 2,000 blows per minuta, in a mortar provided with screens on both sides, and crushes FINE 600 lbs. per hour, requiring one-horse powar to driva it. Has bean thoroughly tested, and is guaranteed to giva good satisfaction. PRIOE, $600.

G. D. CROCKER,
17v26-tf 315 California street, San Francisco.

THE EXCELSIOR MINING PUMP.

WITH SEVEN YEARS' USE OF THIS PUMP WE CONFIDENTLY

Recommend its use for Mining and Prospecting.

IT IS

The Cheapest Pump in the Market.

THERE IS NO TRADE PUMP MADE OF EQUAL STRENGTH AND POWER.

Every Pump is Tested

By Hydraulic power to 250 pounds to the square inch. So every Pump, large or small, is

WARRANTED

To Force Water 250 Feet High.

Varney's Patent Amalgamator.

These Machines Stand Unrivaled.

For rapidity pulverizing and amalgamating ores, they have no equal. No effort has been, or will be spared to have them constructed in the most perfect manner and of the great number now in operation, not one has ever required repairs. The constant and increasing demand for them is sufficient evidence of their merits.

They are constructed so as to apply steam directly into the pulp, or with steam bottoms, as desired.

This Amalgamator Operates as Follows:

The pan being filled, the motion of the muller forces the pulp to the center, where it is drawn down through the apperture and between the grinding surfaces.—Thence it is thrown to the periphary into the quicksilver. The curved plates again draw it to the center, where it passes down, and to the circumference as before. Thus it is constantly passing a regular flow between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powder, and the metal amalgamated.

Setlers made on the same principle excel all others They bring the pulp so constantly and perfectly in contact with quicksilver, that the particles are rapidly and completely absorbed.

Mill-men are invited to examine these pans and setlers for themselves, at the office, 229 Fremont Street, San Francisco

At the lowest Market Prices.

Cazin's Combination Ore-Sizer and Concentrator—One Plunger System.

[Covered by Letters Patent of July 2d, 1872, and recent applications.]

Containing a sizing apparatus, (revolving screen) delivering two or four sizes of ore to two or four rows of sieves, each row independent of the other, and each having 5 sieves, each row concentrating according to specific gravity the special size automatically fed unto it, resulting in the simultaneous continual delivery of separated materials, working 2d and 3d-class ores into 1st-class ores of perfect cleanness. It thoroughly separates native gold or copper from quartz or any other lode matter;—galena and silver sulphurets from pyrites, baryta and quartz; and pyrites from quartz.

Added to a battery of stamps these machines constitute a full system of ore concentration, sufficient in most cases for the requirements of western mines, with a capacity of 15 or 20 tons per 24 hours.

For particulars apply to,
F. CAZIN, M. & C. E.
Supt. Denver Concentration and Smelting Co.,
At Denver, Colorado, Lock-Box 2226, or corner of Blake and 32d streets. ag8-16p

VOLUME XXIX Number 15.

A Curious Experiment.

An old Trick Again Coming into Vogue.

Every now and then an old wonder, which has been sleeping in the unused corners of a few memories for years, is revived and excites a momentary surprise, makes a new draft upon our credulity, and again subsides. It appears to have no connection with the acts of "epiritualists," although such people and the practitioners of natural magic have a general monopoly of latter-day miracles. This ancient wonder—sometimes called "body lifting," sometimes "buzzing up," it is said is just now being revived again in East Norwich, Long Island, where it is making quite a sensation, and is said to be regarded as an innocent amusement quite apart from the so-called spiritual demonstrations of the present day and times

In order that the description which follows may be more readily understood, we have introduced the following illustration which appeared for a similar purpose, several years ago in an eastern publication. This is what a newspaper correspondent says about it as now practiced on Long Island :—

"The young people collect together in company and lift each other by the tip ends of the index fingers. The subject to be lifted lies down upon the carpet, face upward. He is instructed to assume a stiff or rigid state, approaching the condition of a stick of wood as much as possible.

"The lifters, six in number, stand three on each side. Then at a signal, the snapping of a finger by the leader, the lifters and subject inhale the atmosphere, filling their lungs to their utmost capacity. When this is done the lifters stoop and try to lift the subject. If they fail they again assume an erect attitude, and again inhale; then try again, and thus repeat the operation till at last, generally the second, third or fourth trial, up goes the subject like a feather, being frequently borne to the ceiling on the tip ends of the fingers of the lifters. They claim that the heaviest person lifts as easily as the lightest. Subjects weighing two hundred pounds have been thus lifted by four persons. Some declare that the operation produces an exhilerating sensation; others that it causes depression.

"The writer of this article was thus lifted, and experienced no unusual sensation more than he went up without any apparent physical effort on the part of those who lifted him. It is said that if one of the actors laughs or does anything to cause him or others to exhale while the subject is going up, the latter will immediately come down unless he is caught by main strength. The cause of all this the operators claim to know nothing about."

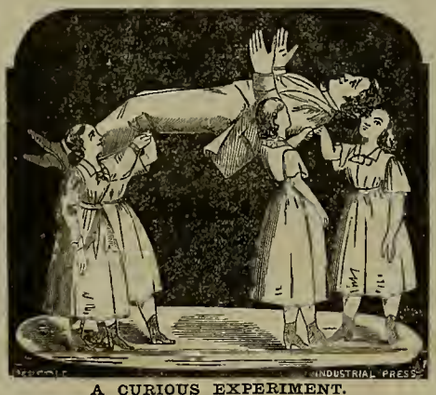
This writer thus speaks of his own experience with apparent candor. It is true he does not give his name, but he doubtless had his own good reason for remaining concealed—probably for fear of ridicule. It is a very simple experiment to try.

The only materials required are about five able-bodied men, immeasurable faith, and a securely locked and shuttered room for a laboratory, with a long tallow dip for witness. The operators ought to be sworn to keep each other's secret, and in case they fail, of course they will say nothing about it. If they succeed, the bond of secrecy to be annulled by success.

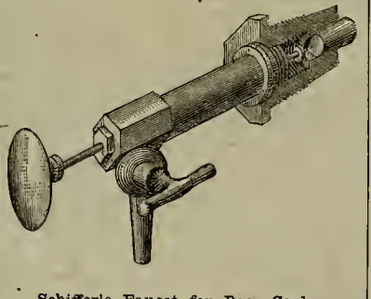
It is possible that this story may be of a piece with such as are often honestly told by school boys who have done some wonders, or think they have, and they recollect hearing that their fathers did the same things when they were boys; and thus the traditions descend through the generations, and now and then the newspapers record them in more durable shape. Still, after all, it may not be "a school-boy's tale—the wonder of an hour;" and if it be indeed true, it doubtless has a philosophy which may be penetrated. Who knows—this toy of time, this youth's plaything, which age dimly remembers yet feels obliged to laugh at, may evolve a true principle of natural law, which it is said to suspend or set at defiance? There have been many childish blunders upon truths, and this may be one of them, continually thrusting itself upon the attention of mankind for recognition.

Sir David Brewster in his "letters on Natural Magic," speaks apparently somewhat seriously of the matter as follows :—

One of the most remarkable and inexplicable experiments relative to the strength of the human frame, which you have yourself seen and admired, is that in which a heavy man is raised with the greatest facility, when he is lifted up at the instant that his own lungs and those of the persons who raise him are inflated with air. This experiment was, I believe, first shown in England a few years ago by Major H., who saw it performed in a large party in Venice under the direction of an officer of the American navy. As Major H. performed it more than once in my presence, I shall describe, as nearly as possible, the method which he prescribed. The heaviest person in the party lies down on two chairs, his legs being supported by the one and his back by the other. Four persons, one at each leg and one at each shoulder, then try to raise him, and they find his dead weight very great, from the difficulty they experience in supporting him. When he is replaced in the chair, each of the four persons takes hold of the body as before, and the person to be lifted gives two signals by clapping his hands. At the first signal he himself and the four lifters begin to draw a long and full breath, and when the inhalation is completed, or the lungs filled, the second signal is given for raising the person from the chair. To his own surprise and that of his bearers, he rises with the greatest facility as if he were no heavier than a feather. On several occasions I have observed that when one of the bearers performs his part



A CURIOUS EXPERIMENT.



Schiffer's Faucet for Beer Casks.

ill by making the inhalation out of time, the part of the body which he tries to raise is left, as it were, behind. As you have repeatedly seen this experiment, and have performed the part of both load and bearer, you can testify how remarkable the effects appear to all parties, and how complete is the conviction either that the load has been lightened or the bearer strengthened by the prescribed process.

At Venice the experiment was performed in a much more imposing manner. The heaviest man in the party was raised and sustained upon the points of the forefingers of six persons. Major H. declared that the experiment would not succeed if the person lifted were placed on a board, and the strength of the individuals applied to the board. He conceived it necessary that the bearers should communicate directly with the body to be raised. I have not had an opportunity of making any experiments relative to these curious facts; but whether the general effect is an illusion or the result of known or of new principles, the subject merits a careful investigation.

A TEN-STAMP mill will be put up to crush ore from the Leopard mine, in the Cornucopia district.

Academy of Sciences.

The regular semi-monthly meeting of the California Academy of Sciences was held on Monday evening last.

William J. Fisher presented a collection of Japanese specimens, including two pair of shoes and a hat; a sample-book containing several hundred specimens of fabrics, a water-proof coat, manufactured of paper, sponges, etc. W. G. Harford presented 13 species of crustaceans from the island of Santa Rosa. W. J. Fisher presented 23 species of crustaceans from the Sandwich Islands and Japan. J. L. Bray presented several specimens of iron ore from the northern part of Coos county, Oregon; two bottles of gold-bearing sand, from the ocean beach of same county, and a bottle of platinum, found in black sand on the same beach. Dr. Kellogg presented a very extensive collection of plants. Mr. Hoffman presented the map of California, issued by the State Geological Survey.

Dr. Cooper made some interesting remarks on California in the pliocene epoch, referred to more at length in another column of this issue.

A paper by Stephen Powers, "The Aborigines of California," was read by the Corresponding Sec'y.

Professor Hilgard, who is now delivering a course of lectures on agricultural subjects at the University of California, was introduced. After congratulating the members on the flourishing condition of their organization, the number present, greatly surpassing the ordinary meetings of scientific bodies of the East, the gentleman delivered an interesting discourse on the geology of the country north of the Gulf of Mexico, which had engaged his constant study for the past 18 years.

Henry Edwards presented the report of a special committee appointed to inventory the library and herbarium of the late H. G. Bloomer, Curator of the museum, with the view of purchase by the Academy. The committee reported 119 volumes in the library, many of which were valuable works not frequently met with, and there were 66 packages of plants, embracing rare species. The fair value of all was estimated at $700. The committee, however, considered the great services the deceased had rendered the Academy, during a membership of 20 years, and his death was an irreparable loss, and therefore recommended that $1,000 be paid for the books and herbarium in quarterly installments of $250 each. The report was unanimously adopted.

Dr. Cooper presented a specimen of a fungoid growth with the following remarks. A fire passing through a grove of willows scorched many without killing them. On the bark of these the sap afterwards exuded of a deep red color and dried where exposed to the sun in transparent drops, resembling cherry gum, but not gummy, bitter like salicine, and of a beautiful blood-red color. Where kept moist by the dews and fogs, this sap-like exudation soon began to vegetate into an orange-red fungus, which grew about two or three inches long, covering the bark which had become dead with a mossy growth. Though it would be supposed according to scientific belief, that the spores of this lichen or fungus merely found a suitable place to grow in the scorched sap, it looked very much like a case of "spontaneous generation" of fungus from the sap itself.

JOHN M. ECKFELDT, melter and refiner in the Mint, in this city, committed suicide on Thursday last. He was also superintendent of machinery in the new Mint building. It is thought that he took his life in a fit of temporary insanity, induced by overwork.

Tap and Faucet for Beer Casks.

John G. Schiffer, of this city, has recently patented through the SCIENTIFIC PRESS Patent Agency, an improved tap and faucet for beer casks, an illustration of which is shown on this page. The invention is a device for making the connection between the interior of the beer cask and the faucet, and consists in the use of a plunger or rod, which passes through the faucet, being packed so as not to leak. The socket into which the faucet screws is screwed tightly into the barrel, and its central opening is stopped by a plug. After the faucet is screwed down to its seat, a blow upon the sliding rod or plunger forces it against the plug, thus driving it into the barrel, and leaving the connection open to the faucet. The construction of the faucet is easily seen by means of the engraving.

When it is to be used the faucet is screwed into its place, and the head of the rod is struck so as to force its inner end against the plug, and thus drive it into the cask. This allows the liquid in the cask to fill the faucet, in readiness to be drawn by turning the cock, and there will be no waste by making the connection with the faucet, as the whole is made tight before the plug is driven out.

PATENT SUIT.—Some time since the Giant Powder Co. commenced a suit in the United Circuit Court, in this city, against the Hercules Powder Co. for allogod infringements of the Giant Powder Co.'s (Nobel's) patents. The particular patents upon which this suit was based were the original patents of Nobel, in which he claimed an explosive compound, composed of nitro-glycerine as the explosive agent. The defendants (the California Powder Co.) entered a demurrer to the complaint, which demurrer was sustained by the court and confessed by the plaintiff, and leave was granted to the defendants to amend their complaint within thirty days. A new complaint will be prepared and filed.

BOOT HEELS.—If we were to examine the heels of a hundred persons, chosen indiscriminately, we would find out of that number at least 90 pairs of boot heels that are worn off on one side, or "run down," as it is called. This running down of the heel is attributed to various causes, such as: imperfection in the structure of the heel, crooked walking, bow legs, etc.; but the usual and almost universal cause is a weakness of the ankle-joint, which tends to give the heel a grinding action upon one side as the person walks. Strengthen the ankle and you cure the boot heel.

THE Cloverdale Quicksilver Mining Company, whose claim is located at the junction of Squaw and Sulphur creeks, Sonoma county, is taking out remarkably rich ore. It has twenty men employed, who have already taken out 250 tons of ore, which will be ready for the furnace to be completed in about four weeks.

NOXES 10-stamp mill, Yavapai county, Arizona is now ready to reduce ore. A new 10-stamp mill is to be put up on Kirkland creek to crush from the Vesuvius mine, same county. Still another 10-stamp mill is to be erected by Sexton & Co. in Weaver district, same county.

BULLION shipments from Belmont for September, were $11,970; from Austin, in the same month, $113,000; from the Twin River (formerly the Murphy), in Ophir Cañon, $10,000.

THE Prussian Silver Mining Company, at Jefferson, have completed their new mill, and the stamps will drop in a few days. The hoisting works over the Prussian south shaft started on Tuesday.

FUEL.—Large quantities of wood are being brought up from the Carson river by rail and teams for consumption in Virginia and Gold Hill. All of the companies are laying in large supplies of fuel for winter.

THE Yellow Jacket Mining Co. are building a new ore house.

Professor Carr and the University.

Professor Carr has published in the *Chronicle* a full and elaborate statemsnt of ths matters at issus between himself snd the Regents of the State University, giving at ths sams time a succinct history of tbe action of the Board in relation to the Agricaltural and Mechanical Art Colleges, from the date of the organization of the University. Ths statement and history is too lengthy to admit of its publication entirs, in the PRESS, as it would occupy about five of our pages. Hencs we can give only a brief digest of the dscumsnt. Those who do not es the *Chronicle* may be pleased to learn that it is soon to be printed in pamphlet form for general circulation.

The Professor starts out with a history of ths Congressional action which led to the national endowmsnt of Agricultural colleges in the sevsrsl States. Ths shars of California in this national gift was 150,000 acres of land, which, by act of Legislature was appropriated to the founding of a University, in which, to meet the requirements of the Congressional act, a Collsgs of Agriculture was first to be established, to bs followed in the order as named by a College of Minss, a College of Civil Engineering, and a College of Letters—the latter to bs coexistent with the College of Arts.

Grave Defects.

Ths Professor thinks that the injustice complained of in rsgard to the Collegs of Agriculture has been brought ahout, not so mnch by a dsfectivs plan of organization so far as its educational features are concerned, as by the extraordinary powers conferred upon the Governor snd Board of Regsnts. By virtne of these powers, he says, ws havs the auomoly of an institution created by a public fund, supported by public taxation, which is to all intents and purposes a private institution, beyond the reach of penalties of the press or of public censure for malfeasance in office.

The Regents hold tbat ths grant of Congress to "provids colleges for ths benefit of agriculturs and the mechanic arts," was "really granted for ths encouragement of all branches of modern scientific instruction, and was so construed in the application of it to ths Univsrsity of California." The history of ths Credit Mobilier and every great fraud committed upon ths pnblic under the sanction of law, says ths Profsssor, shows that ths first steps of the fraud havs heen to obtain tbs necsssary legislation. In all tbe shitting scenery of the play ths conspicuous figures remain ths same. They also at first construed ths provisions of the organic act with regard to a Secretary to be impracticable.

Ths professor next proceeds to review ths act of transfersnco of ths College of California to the State University; criticises the manner in which the first Board of Regents of the Univsrsity was mads up, and their early acts in selling off a large portion of tbe University grounds.

Ths organization and opening of the Univsrsity, in which Prof. John Ls Conte largely assisted as acting Prosident, is favorably alluded to.

The Agricultural College.

Prof. Carr having beeu called upon to take charge of the professorships of Agriculture, Agricultural Chemistry, and Horticnlture, entered upou active duties at the opening of the University September, 1869, and occupied his first year with two lectures a week to the advanced class; a course of twelve lectures to the Normal School, and in lecturing to agricutturists and school teaching, at there various gatherings. In addiion to which he devoted considerable tims to a thorough and systematic study of tho agricultural capacities of the Univsrsity grounds at Berkeley.

The Professor was informed January 5th, 1870, by a nots from Secretary Moulder, that Dr. Merritt had heen authorized to expend $1,500 in "ornamenting tbe grounds" at Bsrksley; and the suggsstiou was made that he should confer witb the Dr. about "the introduction of new and valuable plants." The Professor promptly expressed his willingness and desire to aid in any work in that direction. and proffsred some additional suggsstions. The result was the setting out of a few acacias, blue gums, etc.; but nothing being dons or proposed by the Regents of any practical valus.

Early in May the professor addressed a letter to the Regents making such practical suggestions as his experience and observations at similar institutions suggested, to which communication no answer was ever returned; but some two months afterwards the Board of Regents passed some resolutions directing him to deliver ons or mors lectures at importsnt localities, in all portions of the State, on snch subjects connected with agricultnre as were likely to bs of tbe most value and interest to ths various localities. These rssolutions became famous by rsason of the remarkable declaration of which they containsd, that the Regents proposed by this act "to transfer ths Agricultural Collegs of the University from ths closst to the fisld," a declaration absurd in its nsturs, and which became a standing jest among the teachers throughout ths Stats.

The Profsssor did his bsst to carry the spirit of the resolutions out, as thousands of persons in all parts of tho State can testify. During the first year of this work he traveled about 2,000 miles, and over 3,000 milss during ths second year. The only changs ever mads in this programme was a notice from the Regents, "to incur no additional expenss for traveling while delivsring lectures until further notice."

Considerable spacs is devoted to ths Professor's correspondence with the Regents in rslation to laying out the University grounds, and ntilizing them for agricultural instrnction. Hs dsvoted mnch tims to this matter, brought to it much valuabls experiencs and observation of his own, consulted with some of the ablest and best experienced individuals and teachers from the East, who chsnced from time to time to bs in California, and his plans were fully sndorsed by Prof. Bolander. Yet hut littls or no attention was paid to his communications, or at least not till after his expulsion was resolved upon. To the average mind, outside of the Board of Regents, it would seem that ths Agricultural Professor of ths University should hs fully consulted in such matters; but sach does not appsar to havs hecn ths cass—and while only $400 was expended under his direction, over $20,000 was expended undsr ths direction of Dr. Merritt.

In July, 1872, Mr. Boiander, in ths form of a resolution, urged npon the Regents the immediats location of grounds to be devoted to agriculture and horticulture, presenting his suggestions under ton distinct heads. These rssolutions were for tbe time laid on the table; but in September following, Professor Csrr again urged the importance of ths subject on the sttention of the Regents, when ths constrnction of a greenhouss and the employment of a gardensr was finally ordered. But as no location was mads for improvements, notwithstanding frequent appeals for the same, supplemented by letters and advice to that effect from Dr. Grey, who was tben perfecting a similar work for Harvard University, nothing was done. The inference drawn, is tbat Professor Carr's plans for utilizing the grounds for purposes of instruction, would interfers with the plsns of ornamentation proposed by Fred. Low Olmstead, which requires an expenditure of from forty to eighty thousand dollars.

President Gilman.

Under this bead the Professor writes: "Soon after tbe inauguration of President Gilman it became evident that he had not only no sympathy with ths Agricultural College, but that he would use all his influence to divert its means into other channels. Hs pronounced tho organization so carefully studied by acting President Le Conte, as "extremely faulty and defective," and in the register, soon after publsbed, wiped out the College of Agriculture, as sucb, making an agricultural "course of study" one of soveral not essential to any degree confsrred by the University.' So marked was this changs that when the head of ths Department at Washington wrots to ms for ths statement of ths condition and progress of our Agricultural Collegs, to include in his report to Congress for 1872, and I replied by sending the register (not feeling authorized to speak for ths President or Regents), hs immediately replied: 'Wbat I want is a register or catalogus or other document concerning your Agricultural Collego. Pleass fill the inclosed blanks, answsrs to specific questions which will give the desired information.' I gsve the letter and blanks to President Gilman, with a copy of ths previous report made under President Durant.

When the congressional report was distributed, the information concerning our Industrial College of Agriculture and the Mechanic Arts was confined to two brief paragraphs, as follows: "Tbe most important change made in this college during the present year is the election of Daniel C. Gilman, President of the University." President Gilman is a graduate of Yale College, and was for several years Professor in the scientific school of that college. He has spent some time in Germany in the study of science in Berlin. His inaugural address was delivered at Oakland, Novembsr 7th, 1872, and is replete with practical obsservations on the principles and charactsr of the education which our public demands." "The farm has not been improved, etc." "Students are not instructed iu agriculture outsids of the school room."

The Professor complains that aftsr suitable rooms in the new Agricultural College buildings had been assigned to the use of the various Professors, hy mutual arrangement between the Faculty and Building Committee, and the furnishing either completed or in progress, Pres. Gilman informed him that the rooms designed for him were wanted for other purposes. By this act all his plans for exhibiting rars and valuabls plants and conducting sxperiments towhich light and heat were essential, were thus snmmarily overthrown by relegating the accommodations into the north end of ths basement. He says: "I remonstrated strongly" and said "I should be asbamed to take the farmers of the State through ths buildings and exhibit such accommodations for the Agricnltural College."

The paragraph on page 69, of ths Regsnts statemsnt to the Joint Committee of ths Legislature, is untrue. My remonstrances were made to ths Prosident, as my communications usually wsre after his appointmeut. If the Board never received "any expression of my wisbss," it was not my fanlt.

The Regents say, (also on page 68 of their statement,) that "ou ths rsmoval to Berkeley, ths sum of $500 was placed at my disposal to secnre the aid of competent lectnrers during the ysar in matters of practicsl agriculturs." This is not true. I nevsr heard of this except in the pagos refsrred to, and never knowingly had a csnt at my disposal for thess purposes. (See following letter to Regents, April 6, 1874.) I did what I could to maks the bassment rooms assigned to my use presentable before the visit of the Legislative Committees, occupying the holidays in furnishing them with my own library and collections. Ths lecture-room, without fire, was sxceedingly cold and damp dnring the rainy ssason."

Professor Carr and the Legislative Committee.

Ths Professor, in referring to the matter of invsstigations of ths 1sst Legislature, says: "Learning that I was accused of having furnished thess Committses with information, and as ths mattsr of University rsform was getting mixed up with ths Merritt investigation, I mads an explanation to the Advisory Committes of ths Rsgsnts, no testimony from me having bsen called for by any Committee of ths Legislature np to that tims. I showed them that I had no connection whatever with the Legislative proceedings in ths matter, sxcept such as havs necessarily resulted from the kind of service in whicb I have been employed; that while I had endeavored to carry out the intsnsions of the Board, ss first explainsd to me by Regents Tompkins and Fitzgerald, and sfterward hy formal resolutions and instructions, I had as faitbfully rspresented ths sentiments of the peopls to thsm, and had rspeatedly placed before them in writing ths measures which had bean urged upon ms as important to securs a cordial fseling toward the University and its work; that I had svery resson to believs that the manner in which I had represented the aims and objects of the Univsrsity were approved by ths Regsnts and by the public; aud that I had been placed without intention on the part of ths Regents in the difficult positiou of reconciling ths various published announcements of the Regents with ths dormant condition of ths Agricultural Collegs, and thst I had been placed before ths pnblic in ths position of apparent responsibility without the power to meet it. Of tbis, a resolution authorizing me to appoint a gardener, without providing materisl for the prosecntion of his work, or locating grounds for his operations, was an illnstration. In conclusion I said: "In the peculiar relation which ths transference of ths Agricultural Collegs 'from ths closet to ths field' has placed me toward the peopls of this State, I have neither been disloyal to their interests nor to yours, but havs always acted on ths belief that these were identical. If loyalty to the interests of industrial education, to which I havs given ths bsst years of my life, and mean to give what remains of it, is treason to the University, or if it is so construed by your honorable body, I must plead guilty to the charge."

* * * At this juncture ths Professor of Agriculture was informed that ths Regents contemplated his snmmary removal on the ground of disloyalty to his smploysrs. The charge of incompetsncy was not made. Ths Secretsry addressed to me a letter of inquiry as to whst, in my opinion, "was feasibls for the improvemsnt of instructions in agricultare and horticulture," as if no suggestions on that subject hsd sver been presented to tbsm. I replied by referring them to former communications, with some new suggestions.

The House Committee on Education had reported favorably to a changs in ths management of ths University, on ths gronnd thst ths various callings, interests and sections of ths State were not represented in the Bosrd; 18 of its 22 members being lawyers and business men, having their offices in San Francisco. The Committee said, "All admit that the Professor of Agriculture is not only a scientist, but a thoroughly practical instructor. He should live on the ground, and students shonld be allowed to labor, thereby applymg science under the direction of their instructors."

Incompetency.

On April 7th, the Board, through Mr. Stearns, their Secretary, addressed an application to me for information and printed docnments on the subject of agricnltural education. This, to an incompetsnt party, by those who know so wsll what agricultural ednoation is at home and abroad, was answsred two days later with full details on every point.

We may here introduce, as a somewhat extraordinary matter nnder the circumstances, the statement of Professor Carr, that not one of the Regsnts—not evsn Prssident Gilman, himsslf—has ever besn prssent at one of the Professor's lectures to tbe agricnltural class. Perhaps, nnder thsse circumstancss, the Regents are competent judges of incompetency and unfituess; but the public would like to know *how*.

Bnt we have neither time nor spacs to follow the subject further. Thoss of our readers who would liks to know more of the matter will no doubt taks ths trouble to secure a full copy of the Profsssor's statement, which will eoon be placed within ths ready reach of all who may desire its full perusal.

IRON WORKS IN THE UNITED STATES.—The Americau Iron and Stesl Association have issued a pamphlet giving a list of the iron works in the Unitsd States, including furnaces, rolling mills, steel works, forges and bloomariss. The totals are 681 complsted blast furnaces, 343 rolling mills, 51 stsel works, 37 forges and 47 bloomaries. Blast furnacss recently abandoned are recorded; also furnaces in course of erection or projected.

UTILIZING GRAPE-STONES.—It is nsual to throw away graps-stones as a waste product, but it appears they can be turned to good account. When roasted and gronnd they possss an aroma very much like that of East India coffee, and the bevsrage obtained therefrom is about the same as coffee in tasts, though infsrior in quality. Au acre of vinsyard ordinarily yields 30 to 40 pounds of this seed.

The Ramsdell Mill.

Whils on a trip down Gold cañon yesterday, we mads a short halt at the Ramsdell mill, sitnated in ths cañon a littls distancs abovs ths Silvsr Hill mins. The owner of ths mill, Mr. Joseph B. Ramedell, kindly took us in chargs and showed ns through ths works. Mr. Ramsdsll is one of the old pionesrs of Nsvada, having come here in esrly days, and though possessed of bnt limited mesns, mansged to erect a small prospecting mill, gradually enlarging it as times would permit. This hs continued to rnn for several years—in fsct until it wss literally worn out—whsn, yielding to the necessitiss of the occasion, hs formed a littls ring of his own and resolved to supply its place with the pressnt enlarged strncture. The hstteries are three in number, and, contrary to the usual custom, contain only two stamps, the stamps weighing 700 ponnds each, by which arrangement it is claimed a grsatsr nnmber of tons of ors can hs reduced in a given length of tims. Ths mill is so constrncted that the pulp flows dirsctly from the batteries into largs settling tanks, on ths lower side of which ars arranged six large Hepbnrn amalgamating pans for grinding the pulp; and thsn again on the lower side of thess amalgamating pans are rangsd the settlers, so that from the tims the ors is shoveled into ths self-feeders at the battsries, there is no mors labor until the pans ars ready to bs cleaned up. Ths steam power by which ths machinery is run is ampls for the addition of mors stamps and amalgamating pans, whenever it is desirable to erect thsm. The new building is well put up and evsrything arranged in and ahout the mill, with a view to ths closets economy and convenience. The mill will commencs crushing ors from ths Lso mins tomorrow. Mr. Ramsdell, with his long experisnce in the business, heing snabled to work the gold ores along Gold cañon up to within a very small percsntags of their assay valuss. If we had more men of ths go-ahsad Ramsdell stamp our community would bs gnons the loser.—*G. H. News.*

HARDWOOD LUMBER.—The largs and prospering business of ths firm of Whits Bros. is conducted at 108 and 110 Market street and 5 and 7 Cslifornia street, in a part of ths city of San Francisco which, within ths recollection of ths "oldest inhabitant" was at ons time covered by ths waters of ths bay. Beneath ths buildings which they occupy ars the remains of one of the old-tims crafts. Their edifice is 150 feet long by 55 feet wide and two storiss high. It is much mors spacions and convenient than elegant, but is well located for their business. Here ths stranger and ths curionsi hsvs an opportunity of seeing and sxamining in "the rough" ths style, quality and variety of soms of ths woods in ordinary use in this city. California furnishss the laurel, ash and maple; Oregon, from her abundance, can spare a part of her ash, maple, pine and alder. These woods and ths California laurel are susceptible of a very fine finish, and equal in appearancs the fine Eastsrn woods. Indiana sends walnut and poplar. New Jerssy, Ohio and Psnnsylvania contribute the sturdy oak, ash, hickory, cherry and maple. Other Statss contribnte their quota. From Mexico is imported Spanish cedar and mahogany. This being all seasoned lnmber, is a dry subject to write about. The amonnt of bnsiness done annually by this firm is about $120,000. Their freight bills by rail, sailing vessels and steamers this year will be $40,000. TOMHAGAN.

A BIG LATHE.—The big lathe which has been for some time in process of construction at the Union foundry on the Divide, has been so far completed that it has been set up temporarily and is now in use. It is for tnrning off large iron wheels and pullsys. They have turned in it some pnllsys for ths Justice mining company which are seven feet in diameter. As the laths now stands they are able to turn a whsel ten feet in diameter. Next spring it will bs set up in a building that will be erected pnrposely for its reception, whsn it will be so placed that a wheel twenty feet in diamster may be turned on it. It now stands upon a fonndation constructed of timbers, bnt it will then be placed upon a foundation laid as deep in the ground and as firmly tisd and bolted with rods of iron as would be the case were it intended to support the most powerful hoisting or pumping engine. Although the laths is so far completsd that it is in use, yet to maks it psrfect in every part not less than fifteen tons of castings will be required. The lathe is being built under the supsrvision of Charles Cummings, one of the propristors of the fonndry, and when finished will he one of the largest and most complets machinss of the kind on the Pacifio Coast. It takes a shaving an inch in width off an iron wheel about as easily as though it were merely the softest wood. A grsat pressure of work caussd the proprietors to sst the machine np temporarily—it was a thing so much nssded that thsy were obliged to begin nsing it as soon as it could be made to work at all.—*Virginia Enterprise.*

IMPERMEABLE PAPER.—By plunging a sheet of papsr into an ammoniacal solntion of copper for an instant, then passing it betwean the cylinders and drying it, it is rsndersd entirsly impermeable to water, and may even be boilsd in water without disintegrating. Two, thres, or any number of sheets thns rolled togsther bscome permansntly adherent, and form a material having the strength of wood. By the intsrposition of cloth or of any kind of fiber betwesn the layers the strsngth is vastly increased.

MECHANICAL PROGRESS.

A New Kind of Glass—"Bone Glass."

A new and most interesting kind of colored glass has lately come into use, which is known as "bone glass," of which very little has as yet been said in glass literature. It is a white opaque glass, and its name hints at its composition and nothing more, especially since cryolite has come to be used in the manufacture of glass. This kind of glass is used for lamp shades and globes to protect the most important organ of the human body, the eye; and formerly it was both rare and expensive. Cryolite, however, has effected as great a revolution in the manufacture of white glass as petroleum has in the means of illumination. What part the chief constituent of the bone, the phosphate of lime, played in the manufacture of the bone glass was not exactly understood, and a still thicker veil is drawn over the action of the fluoride of lime, soda and alumina, known as cryolite. It is to offer some explanation of this action that Fischer takes up this interesting branch of the glass industry. Phosphoric acid is, at a high temperature, a very powerful acid—so much so that no other acid is able to displace it. Hence we may reasonably suppose that the phosphate of lime remains suspended, as such, in the molten mass of glass. This, too, is indicated by the fact that when an excess of bone dust is added to the glass, or on suddenly cooling it, it is rough on the surface; but if the glass has the proper constitution, it remains perfectly smooth. How may the action of cryolite be explained? The power of hydrofluoric acid to etch glass and render it matt is well known, and depends on the decomposition of the silicates, taking from them a part of the silica, and the soda or potash, so as to form a compound known as fluosilcate of soda or potash, and then flying off in form of a vapor. We all know that this takes place, to a greater or less extent, in every cold, completely formed glass; how much easier and better would this process take place under the ægis of heat?—*Scientific American.*

A NEW TIDE WHEEL.—Mr. Andrew Folsom of Warren, R. I., has recently devised and constructed a tide mill in that town, which is described as follows: The wheel is upright, and in hight or depth 7 ft., and 7 ft. across. The wings or arms are 28 in. in width, 62 in. in hight, and 39 in. in length, so that the flood tide, when the wings are open a depth of 7 ft. and a width of 39 in. is secured for the force of the tide to act upon for the purpose of power to move the wheel and load that may be attached thereto. On the flood tide the arms open on the west or left side, and on the ebb on the easternmost or right side of the wheel as it now stands. After passing certain points the arms close and the resistance is only the thickness of the three-eighths of an inch iron. The wings are three tiers deep, and so arranged that a number of them are opened at a time, and add to the power and force of the wheel the full depth of the water. These wings are secured to the shaft by hinges that work very smoothly. A cast-iron circular plate seven feet across is at the bottom of the shaft or wheel, one at the top of the first tier or wings, one at the top of the second tier, and one at the third tier, with sufficient space between so that the wings play entirely free. The wheel is not as yet loaded, but it moves very true and without noise or jar.

A NEW LOCOMOTIVE ENGINE.—A very singular locomotive engine, for working under ground, as in collieries, has been patented by Messrs. Hurd & Simpson, of Wakefield, Eng. The invention consists in an improved steam and power generator, in which the products of combustion from the fire receptacle are returned to the same by means of an injector actuated by compressed air or other equivalent agent for drawing off the products of combustion, and forcing them again into the fire receptacle with or without an admixture of compressed air or other inflammable fluid or liquid; also in devaporizing escape or exhaust steam, and the machinery or apparatus for effecting the objects above referred to.

A CURIOUS BRONZE is produced in Japan, which, when made in thin plates, resemble slate, and is covered with designs in silver. M. Morin has lately analyzed and examined the properties of the alloy, and finds that it contains, in addition to copper, from four to five per cent. of tin, and on an average ten per cent. of lead. The combination is easily moulded into thin plates. These are varnished, and through the covering the designs are scratched with a graver. The plate is then plunged in a silver bath, when the silver is deposited on the unprotected portions. Lastly, it is placed in a muffled furnace, when the copper blackens and the silver remains bright.

SCHOOL OF MILLWRIGHTS.—Professor Isham Walker, of Lexington, Tenn., suggests that various State organizations of millers and the National Association unite and subscribe funds for the building (at Chicago, Ill.) of a model school flouring mill, at a cost of $150,000. He shows that such an institution, supplied with the best examples of modern machinery, and exhibiting the latest improvements and examples of practical science in milling, would be of immense instructive advantage to millwrights throughout the country, while the stockholders he thinks, would realize handsome dividends every year.

Compressed Air Machinery.

A paper on compressed air machinery, recently read by Mr. William Daniel, before the British Institution of Mechanical Engineers, is a valuable contribution to our knowelge of a class of mechanism, regarding which much interest is now being manifested, while trustworthy information is not abundant. The former portion of this statement is fully verified in this community by the combined interest which has been manifested at the pavilion in this city in regard to the Burleigh drill, and its air compressing machinery.

A very complete series of experiments was conducted by the aid of an air compresser having two steam cyliaders, each 16x30 inches, working compressing cylinders of like dimensions, and the whole mounted on a receiver 24 feet long by five feet in diameter, which formed the bed plate. After the compressed air was led to a portable engine and there cooled, it was admitted to two cylinders, 10 by 12 inches, which drove an engine working a frictious brake. By means of indicator diagrams, taken from this last mentioned engine, as well as from both the steam and air cylinders of the compresser, a record was obtained of the losses of power which took place at various stages. From the data a table was completed, the results of which show that, when working with air at 40 pounds pressure, the usual effect obtained on the brake was only 25¼ per cent. of the power indicated on the steam cylinders of the air compresser, while with 34 pounds pressure the efficiency reached 27 per cent.; with 28 pounds, 28 per cent, was gained; with 24 pounds, 35 per cent. and with 19 pounds, 45¼ per cent. The loss of efficiency due to increased pressures may be ascribed to the conditions of the experiment and the increased loss of heat from the air, attendant upon the higher degrees of compression.

Mr. Daniel advocates the use of compressed air machinery for mines, and points out the economy which must result from the fact that, when the motor is idle, there is no loss except the interest of money expended on the machinery, which is much less than that incurred where animal power is employed. He also suggests that the ventilation of the mines would be improved by the discharge from the engines, while the air, being always available in the pipes, could be used to dilute an outflow of gas.

The discussion of Mr. Daniel's paper elicited a number of practical suggestions. Mr. C. W. Siemens pointed out that the development of heat during the compression of air might be avoided by the injection of water into the air-compressing cylinder, this water taking up the heat as fast as it appeared; while the formation of ice in the engine cylinders might be prevented by similar means, the water in this case giving up heat to the air during the expansion of the latter. Mr. Firth stated that he had got rid of any difficulty with ice by enlarging the exhaust openings. Mr. Brotherhood described his three cylinder engine, as used for working the Whitehead fish torpedo. This had three cylinders, each 1⅜ inches by 1¾ inches stroke, driven by a pressure of 450 pounds per square inch, admitted through a reducing valve from a reservoir of air, stored at 900 pounds per square inch. This engine had run at 2,225 revolutions per minute, developing 2¼ horse power, or 0.28 horse power for each penad of its weight. Mr. Cowper suggested that radiating ribs, cast on the cylinders of air compressers or of engines using compressed air, might serve the purpose of facilitating the omission or absorption of heat.

A NEW MECHANICAL SEPARATOR.—A new form of mechanical separator for the removal of fine particles of iron that become mixed with turnings and fillings of copper and brass from workshops, has recently been devised by M. Varin, of Paris. Two superposed hollow cylinders turn in the same direction, and upon them the material to be separated is scattered through a hopper. The surface of the cylinders consists in bands of soft iron which are kept in a magnetic state. The particles of iron are attracted to these cylinders, and at a certain period of revolution are brushed therefrom into a receptacle, while the scraps or other metal fall to the bottom of the apparatus. The machine is said to be capable of separating 1,100 pounds of material per hour. It has also recently been employed by M. Mangou, for detecting titanic iron in arable earth, with remarkable precision, the iron, in such small quantities as 15 or even 7 grains in 22 pounds of earth, having been readily separated.

CAST NICKEL PLATES.—For some years back much attention has been drawn to the galvanized plating of metals, especially iron, with nickel, and larger plates of metallic nickel have been much wanted for the anodes of the galvaniziug nickel salt baths. The extraordinary refractory nature of pure metallic nickel has been, till lately, a great hindrance to the casting of large plates. Borchert, however, has lately succeeded in casting nickel plates 18 inches long, 14 inches broad, and one-sixth thick. The nickel hitherto used, Saxon Wurfelnickel of 98 to 99 per cent. strength, is fused in crucibles in a simple brazier's furnace, by a coke fire. The fusion requires continual and laborious attention, the metal not becoming fluid till after at least six hours' firing. As soon as it becomes fluid, it must be cast without delay into the sand molds, for as soon as the fire drops a little, the nickel is liable to solidify again into a solid mass, in which case a renewed fusion in the same furnace is impossible.—*C. A. Borchert.*

SCIENTIFIC PROGRESS.

Singular Facts in Regard to Electricity.

The London *Philosophical Magazine* for July contains a synopsis of a recent communication made to the Royal Society by George Gore, Esq., on a new and remarkable phenomenon in the action of electricity upon iron, which consists in the very perceptible twisting of a bar of this metal by the joint effect of currents passing through it longitudinally, and passing round it in the insulated wire of an enveloping helix. The twist may be made so great as to exceed even a quarter of a revolution, and its amount is rendered very conspicuous by means of an index twenty inches long, suitably attached to the end of the bar. The combined influence of both currents is necessary to produce the torsion. Either current singly produces only the ordinary effect of magnetizing the bar, either transversely or longitudinally, without altering its figure. The direction of torsion is definitely related to the directions of the currents producing it. Calling the twist of an ordinary screw a right-handed torsion, the following law may be stated: When the axial current flows from a south pole toward a north pole, the torsion is right-handed; when from a north pole toward a south pole, the torsion is left-handed. If both the currents be reversed, therefore, the torsion remains unaltered; but if either be reversed separately the direction of the torsions is reversed likewise.

When the currents are not simultaneous but successive, torsion is produced, but in a lesser degree. This appears to be owing to the fact that the first current leaves a residuary magnetism in the bar, which conspires with that produced by the succeeding current; the effect being similar to that which would be due to a very much feebler simultaneous current. The torsion produced by a coil current may thus be used as a test of the residuary effect of an axial current, and that produced by an axial current may similarly serve to detect, and perhaps to measure, ordinary magnetism in a bar. The torsional influence is uniformly distributed throughout the length of the bar subjected to experiment.

No torsional effects were observed with rods of platinum, silver, copper, tin, lead, or, in general, any metal or other substances not magnetizable; but nickel rods appeared to be susceptible to the influence, though by no means to the same degree as rods of iron.

Another singular fact has been noticed in relation to the behavior of the steam engine employed to drive one of Mr. Wild's electro-magnetic engines. It appears that whenever pieces of iron rods or wires are placed in the circuit to be heated, the engine slackens speed when the metal begins to redden, the resistance to the action of the engine perceptibly increases in proportion as the heat of the metal increases, and it is only by constant care of the engineer that a uniform rate of motion can be secured.

THE LIGHT OF COGGIA'S COMET POLARIZED.—Prof. Wright, of Yale College, publishes in the *American Journal of Science* the results of his observations with the polariscope upon the light of Coggia's comet. During the greater portion of the time when the comet was favorably situated for observation, it was unfortunately hidden by clouds or extinguished by thick haze. On one or two occasions, however, he was able to obtain evidence that its light was polarized. The polariscope showed the bands, both bright and dark, quite definitely, and they were seen with comparative ease. Observations repeated a number of times agreed in showing that the light was polarized in a plane passing through the axis of the tail; that is, as nearly as could be estimated, in a plane passing through it and the sun. Other observations at a later date gave the same result, though less satisfactorily, as the twilight had begun to interfere with the observations. After waiting until this had disappeared, it was possible to see the bands, though with some difficulty, and the degree of the polarization appeared to be decidedly less than on the previous occasion. The percentage of light thus polarized could not be accurately fixed, but it was not large. The conclusion is therefore that a considerable portion of the light of the coma is derived from the sun by reflection.

LARGE MAGNITUDES DIFFICULT OF COMPREHENSION.—The difficulty of properly comprehending large magnitudes is readily admitted by every one. Who, for instance, can properly comprehend the vastness of the world on which we live? And if we cannot "realize" a diameter of 8,000 miles, how can we adequately comprehend one more than one hundred times that diameter—as the sun for instance? Perhaps it will help us to the conception of such an enormous mass, to recollect that the moon, which seems so far from us, and apparently a near neighbor to the stars, is only 240,000 miles distant, while the sun is 860,000 miles in diameter. If then the sun were a hollow sphere, the earth might be placed in its center, with the moon still revolving in her proper sphere, with a margin of over 180,000 miles, in every direction before we reached the sun's outer circumference. Such is the almost incomprehensible magnitude of the sun, and yet recent observations have very conclusively shown that some of the fixed stars are many times larger than our sun—in fact that the sun is really to other sun's but one of the smallest of stars!

On the High Temperatures Actually Possible.

Several memoirs upon the highest temperatures actually and theoretically attainable have lately been presented to the French Academy. M. Cailletet has been studying the influence of pressure on combustion. He finds, by means of an ingenious apparatus, in which he has been able to burn not only a candle, but also a wick fed with alcohol, in highly condensed air, that the light gradually increases with the compression, finally becoming dazzling and so brilliant as to rival that of phosphorus in oxygen.

But then, however, if the pressure be increased, the brilliance of the light diminishes, the flame become smoky and flakes of lamp-black are deposited. From this it is clear that the temperature of the combustion increases with the pressure up to the point of dissociation of the hydrocarbon gases of the candle. The same fact was shown by the spectrum; the spectrum increased with the temperature up to a certain limit, which could not readily be passed. From these facts Deville draws the conclusion that it is very decidedly an error to estimate the sun's temperature at several millions of degrees. These experiments, as well as those of Berthelot and his own, go to show that there is a limit to possible temperatures, and that a burning body cannot produce heat of an indefinite intensity. "Perhaps," he says, "the temperature of 2000°C. is the highest temperature which can exist in the universe." M. Violle concludes from some experiments which he has made, that there cannot be a temperature higher than 1400°C. anywhere.

THE ACTION OF TIDES ON THE SEA-BOTTOM. Mr. Reade communicates to the Geological Society of Liverpool the result of a series of novel investigations on the action of tides on the sea bottom. He shows that at various points in the St. George and English channels and in the Irish sea, tidal currents were capable of destructive erosive action on the sea-bottom, and that the materials of the Irish sea-bottom are principally composed of rearranged glacial drift, either eroded off the bottom or off the coast by the sea itself, or poured into it by the many rivers. These materials, notwithstanding the oscillatory character of the tidal streams, have in the main a slow, progressive motion down the channel and far out into the Atlantic. It was shown that there are pits or gullies excavated in the bottom in both the English and Irish channels, and that these depressions generally have their major axis conformable in direction with the set of the stream tide. In conclusion, Mr. Reade expresses his conviction that the diurnal and semi-diurnal motion of the tides acting down to the profoundest depths of the ocean, accounts for the preponderance of life in it over that exhibited by the fauna of the Mediterranean.

MICROSCOPIC EXAMINATIONS OF THE AIR.—Mr. Cunningham of Calcutta has published a work of great importance, detailing the results of laborious experiments made by himself, regarding the dust contained in the atmosphere in the vicinity of that city. Among other things, he states that distinct infusorial animalcules, their germs or ova, are almost entirely absent from atmospheric dust. Distinct bacteria can hardly ever be detected, but fine molecules of uncertain nature are almost always present. Bacteria are frequently to be found in the air derived from sewers. Spores and other vegetable cells are constantly present in atmospheric dust. The majority of them are living and capable of growth. No connection can be traced between the numbers of bacteria, spores, etc., and the occurrence of diarrhea, dysentery, cholera, ague, or dengue. The amount of inorganic and amorphous particles and other debris directly depend upon moisture and wind velocity. The amount of spores and vegetable cells appear to be independent of wind and moisture. The dust examined by Cunningham was collected by a special aereoscope and was not scraped from horizontal quiescent surfaces as by Ehrenberg's method.

THE *American Manufacturer* has the following: Great Britain has now 36,000,000 spindles in her mills, with nearly 400,000 looms and 650,000 workmen. Next comes the United States, with 8,000,000 spindles; France, 5,700,000; the German Zollverein, 4,300,000, of which Alsace possesses 1,700,000; Russia, 2,000,600; Switzerland, 1,800,000; Austria, 1,400,000; Spain, 1,400,000; Belgium, 600,000; Italy, 500,000, and over 2,000,000 for other countries.

THE CORRELATION OF FORCES.—Of the various forms of energy existing in nature, any one may be transformed into any other, the one form appearing as the other disappears. This is what is meant by "the correlation of forces." Thus the rotary power of a wheel, if applied to turn a magnet, is converted into electricity; and this electricity, if employed to drive a wheel, is changed back into rotary power.

NEW FULMINATE.—M. Prat says: Picrate of lead has the property of detonating when struck, and may serve as a substitute for fulminate of mercury in percussion caps. He also gives an account of an explosion which occurred in his laboratory on triturating together chlorate of potash, picrate of lead and amorphous phosphorus.

PLATES of polished steel may be used as a substitute for boxwood for engraving, and is said to be better as it does not warp, and is not at all affected by oil or water.

Weekly Variations in Stocks.

[Based on Regular Sales of the most important Stocks on the San Francisco Stock and Exchange Board.]

For 6 days ending Wednesday, Oct. 7, 1874.

Mining Stocks.

During the latter part of this week mining stocks were duller and prices lower than during the first part. A sort of reaction set in, though with probably no more special cause than there was for the rise. The *Enterprise* says that the Comstock, taking it throughout its whole length, is looking better to-day than ever before since its discovery and the opening of mines upon it. Next week the Empire will be added to the list of mines that are shipping and milling ore, and it will not be long before several other mines, great and small, will follow. On the 5th inst. the Nevada will be started up on ore from the Ophir, when that company will regularly extract 100 tons of first-class ore per day. The ore body on the 1,465-foot level is not only exceedingly rich, but is also proving very extensive. A drift has been pushed into it a distance of 29 feet, and is still being advanced in first-class ore. The 1,700-foot level is as yet almost untouched, and when cross-cutting shall be commenced thereon we may look for big developments. In the California they will soon begin cross-cutting, and here we may be sure that rich and extensive bodies of ore will be found, as the ground of the company lies wedged in between the large ore deposits of the Consolidated Virginia on the south and the Ophir on the north. The work of cross-cutting will soon be commenced in the Exchequer ground from the Bullion drifts; while in the Overman, if we are to believe the floating rumors, they are on the point of making valuable developments. Indeed, we are likely soon to see very lively times in all of our leading mines.

The Eberhardt & Aurora mill is still at work crushing the high grade rock extracted from the mines of the company, and from present appearances, will not shut down for months to come.

The peaks of the Sierras were covered with snow on Thursday, for the first time this season.

Mine Swindler's Confession.—One C. A. Robeson has, during the past ten years, at different points, raised companies to go and work rich quartz leads which he pretended to have discovered. He would extract from each of his deluded companions a hundred dollars or so, and, after leading them on a wild-goose chase, would evade them, carrying off his ill-gotten gains, amounting in each case to thousands of dollars. He has played this game successfully half-a-dozen times. This year he has organized a party in Mansfield, Ohio, and took them to Shoshone county, Idaho. He appears to have been unable to escape from them, and writes a confession dated, "In camp on Robeson's Ledge, Shoshone City, Idaho, September 2d, 1874," in which he confesses his misdeeds under oath, and in the presence of witnesses. It is published in full in the *Lewiston Northerner*, and is a curious document. He says that all the maps and written directions given to find the ledges to different parties differ from each other, and were incorrect. He admits this purposely, and admits that all the statements in regard to the ledges have been in each and every instance a swindle. The confession reads as if it were written under fears that he would have been lynched, as he would have been in some parts of the country.

Cherry Creek.—The White Pine *News* is informed that matters at Cherry Creek are looking exceedingly well, and that everybody exhibits the utmost confidence in the future of the camp. The various mining companies are working along steadily with every prospect of a prosperous future; and they certainly have a cheering present.

The furnace being erected by the Newark Silver Mining Co. at this point is rapidly approaching completion, and will soon be ready to run. Ore is being delivered daily.

The Manhattan mine, shipped 15 flasks of quicksilver last week to Virginia, Nev.

The Gwin mine, Calaveras county, is now producing about $6,000 per month.

New Incorporations.

The following companies have filed certificates of incorporation in the County Clerk's Office, San Francisco:

Cornell Watch Co.—Oct. 5. Object: To manufacture, buy, sell, import and export watches, watch cases, watch chains, jewelry of all kinds and rubber goods. Directors: Paul Cornell, John Parrott, Wm. Norris, Peter Donahue and Oliver Eldridge. Capital stock, $300,000, in 3,000 shares.

Pacheco Coal Mining Co.—Oct. 7. Location: Contra Costa county. Trustees: David Meeker, Joseph W. Atwell, J. P. Van Nass, Charles J. Collins and Orlando Beaman. Capital stock, $1,800,000.

The following named company filed certificates of incorporation with the Secretary of State, Sacramento:

South Woodville S. M. Co.—Location: Gold Hill mining district, Storey county, Nev. Directors: Robert Sherwood, J. D. Fry, Wm. Sherman, Jesse S. Wall and J. R. Lee. The principal place of business will be in San Francisco. Capital stock, $6,000,000, in shares of $100 each.

Increase of Capital Stock, Etc.

A certificate of the increase of the capital stock of the Pocahontas Gold Mining company, from $1,200,000, to $3,000,000, was filed in the County Clerk's office, on the 6th inst.

A certificate of the removal of the office of the Owens Gold and Silver Mining company, from San Diego to San Francisco, was filed in the County Clerk's office, on the 7th inst.

Washington Mine.—We received this week a piece of ore from the Washington Mine, which is about 2¼ miles from Hornitos, Mariposa County. The ore abounds in sulphurets; it assays $100 per ton. The ore is worked in a mill and the sulphurets saved and worked separately. A year ago this mine did not pay, and work on it was stopped. It has been started up again, however, and Mr. Webber, the Superintendant, thinks there is ore enough in sight to last two years. They have a 20-stamp mill and will add 20 stamps more this fall. The mine now has very good prospects.

Golden Gate Mine.—Two miles from Sonora, Tuolumne County, which did not pay formerly is now turning out very well. The ore is very nice in sulphurets, and almost five tons of these sulphurets are sent to this city per month. These sulphurets pay about $1,200 per ton, and as the ore itself pays expenses, the money derived from this source is clear profit. Mr. Rider's shaking tables for separating sulphurets in use at this mine, are a perfect success.

Sewer Mining.—We mentioned last week the fact that parties in Austin, Nev., were hunting the sewers for quicksilver and amalgam. We see by the *Reveille* that they continue to meet with good success, obtaining a daily average of between seven and eight pounds of amalgam. The sewer is not over two feet in hight, but the men engaged in the work manage to crawl into it for a long distance. Rough old "mining," that!

Ore Shipment.—During the month of September 20,250 tons of ore were shipped by rail from mines on the Comstock. In addition to this large amount a great deal of ore is hauled to mills in quartz wagons.

A new coal vein is reported on Puyallup river, W. T., from which was taken a specimen that was used in welding steel, and a report of its assay gives about 30 per cent. of carbon, and nearly equal to Cumberland.

The Crown Point, Imperial and Yellow Jacket mining companies disbursed among their employes, on the 3d instant, $76,000, $17,000 and $13,999 respectively.

The Buel furnace, Cerbat, Arizona, from which so much is expected, started up on the 22nd ult. The Buel mill will be running shortly.

A large vein of magnetic iron ore has been discovered on the line of the Seattle and Walla Walla, W. T. R.R., near the summit of the Cascade Range.

Comstock Bullion.—The bullion shipped from Virginia City through the office of Wells, Fargo & Co., during the month of September, amounted to the sum of $1,615,732.27.

The ore shipped over the Virginia & Truckee railroad to the various mills in the vicinity, amounts at present to about 70 car loads per day.

The Eberhardt & Aurora Co., at White Pine, is erecting a large building over the central shaft for hoisting works.

The California mine, Napa County, on Thursday shipped twenty-two flasks of quicksilver to Sacramento.

In Robinson district the new smelting furnace has been running for fifty days, and is still doing well.

Mining in the vicinity of Mokelumne Hill has been temporarily suspended on account of the lack of water.

New Diggings have been struck on Snake Creek, about thirty miles north of Pierce City, W. T.

Nugget.—Schwartz and Wagner found a 15-ounce nugget at Columbia, Tuolumne Co., on the 2d inst.

During the month of September 40,500,000 pounds of ore were shipped by rail from the Comstock mines.

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

California.

ALPINE COUNTY.

Attracting Attention.—*Chronicle*, Sept. 25: This week parties have been looking at several mining claims near Silver mountain for Nevada and San Francisco capitalists. The success of the McGlow process for working our ores is having the effect of attracting the attention of capitalists to the mineral wealth of Alpine, destined to be a successful rival of the great Comstock.

Exchequer.—The new machinery will be ready for service early next week, when we presume the shaft will be sent down to the 200-ft. level. In the meantime the north drift is being run from the 100-ft. level to connect with the old winze. This connection will give fine ventilation to the entire mine, and enable the miners to go to work in the winter without exposure to the elements.

COLUSA COUNTY.

Quicksilver.—Colusa *Sun*, Oct. 2: All our quicksilver mines are prospecting well. The owners of the Wild Goose have determined to put up a furnace; the Beckeye furnace is progressing very well and will be in full operation before the end of this month; the Abbott commenced to put ore in the furnace Thursday, and in ten days will be taking out a great deal of quicksilver. The retorts on the Elgin and Buckeye are kept busy on first grade ore. By the first of January our mines will be turning out at least one thousand pounds of quicksilver daily.

EL DORADO COUNTY.

Crushing.—Placerville *Republican*, Oct. 1: Gross has commenced packing out rock for another crushing. He intends to run enough this time to yield $2,500, and then to commence the erection of a 5-stamp mill. We are told that the 10-stamp mill recently put up on the Young Harmon is working splendidly, and that all appearances indicate that Capt. Woodworth has made a 10-strike this time.

INYO COUNTY.

Men Wanted.—We are authorized to state that as many men as choose to take their blankets and apply to John Shepherd, out on the road in course of construction to Panamint, can have immediate employment at good wages.

Panamint.—Cor. Inyo *Independent:* Our camp is growing at a rapid rate, receiving material accessions to its population daily. Work on the Jacob's mill has been considerably retarded by lack of lumber. The company's mine is developing to the satisfaction of all. The Jones Co. are now on their way from San Francisco, and will start up work immediately on their arrival. This company will employ between 200 and 300 men. The machinery for their 20-stamp mill has been ordered, and the contract let for building it.

KERN COUNTY.

Item.—Kern county *Courier*. The Summer mine and mill driving away; mill running at full capacity. The new hoisting works arriving rapidly and preparations made for putting in position the boilers—the largest in southern California being 16 feet long, five feet in diameter and 21 in number, with numerous copper tubes running full length, and made after the latest and most approved style.

Wood is being brought on the ground ready for a start as soon as everything is in position.

The new mill is going up very rapidly and will be, when, finished one of the most substantial as well as the largest gold quartz mills now in California or Nevada, in fact we might say in America. It will be run by water-power; double turbine wheel, 168 horse-power, fully sufficient to drive 80 stamps, concentrators, pans and settlers, rock breakers and self feeders. This collossal structure sets on a rock foundation, blasted and graded from a natural rock formation, and will be capable of working from 120 to 130 tons per day. Weight of stamps, 750 pounds each.

LAKE COUNTY.

Quicksilver.—Lake county *Bee*, Oct. 1: The mercury continues to rise in the scale and the quicksilver excitement in Sonoma and Lake has by no means subsided. The Cloverdale Quicksilver mining company, whose claim is located at the junction of Squaw and Sulphur creeks, is taking out remarkably rich ore. They have twenty men employed, who have already taken out two hundred an fifty tons of ore, which will be ready for the furnace to be completed in about four weeks.

MARIPOSA COUNTY.

Sherlock's Creek.—Mariposa *Gazette*, Oct. 3: Upper Sherlock's, which at one time—and that not very many years since was famous for big strikes—appears to be coming to the front again. Jake Teats, an old time miner, who has been staying with the half abandoned camp about a quarter of a century, is reported to have struck a very fair prospect on Mullins gulch, in the old hill formerly known as Mugginsville.

Washington Mining Co.—The latest accounts from the Washington mine are up to Saturday last, when they cleaned up after a ten days' run with two batteries. The result was the nice little amount of $7,000. They have a vein of about 10 feet thickness of ore, which is estimated to yield at the rate of $26 per ton.

Rich Sulphurets.—Fourteen tons of sulphurets at the Washington mine, concentrated by the Schofield machine, and worked by the chlorination process, last week, yielded $1,500 in gold.

Hasloe Mine.—A gentleman who was on the north side of the Merced last week, brings the gratifying news that a new pay chute has been developed in the Hasloe mine, yielding $300 a ton.

NAPA COUNTY.

Quicksilver Mine.—Napa *Reporter*, Oct. 3: R. C. Simmons has lately discovered some very rich indications of cinnabar in the mountains back of Yountville. He says the ore is equal to any yet found in this county, if not superior. Mr. Simmons has also located a silver mine, under the name of the "Central," on St. Helena mountain, the rock of which assays higher than that of the Calistoga silver mine.

Quicksilver near Napa.—Wall Kennedy and G. W. Boggs report the discovery of a rich cinnaber within three and a half miles of this city. From the appearance of the rock indications are very good for the development of a rich mine. The discovers are very reticent as to the locality where the specimen was obtained.

NEVADA COUNTY.

Mining Situation.—Grass Valley *Union*, Oct. 2: The mining situation of Grass Valley district is not as encouraging as it should be, but a marked improvement has been made within the last month. However, when the railroad is once begun, everybody here will doubtless lend a helping hand to prospecting, and many of our now idle mines will again be started to work.

New York Hill.—Work on the New York mine is steadily continued. The tunnel is now in 560 feet from the mouth. The present tunnel runs in rich pay rock for a distance of over 200 feet, with a rich ledge still in the heading. There have been several crushings of rock taken from the tunnel, the last one being 57 loads, which returned $58.25 per load, not counting the sulphurets saved. These sulphurets are now being worked, and when the gold from them is extracted they will make the crushing come up to at least $60 per load. This is about an average of all the crushings yet taken out of the mine. The Larimer mill is now at work on New York Hill rock, and a crushing of 50 loads is being put through, which will certainly come up to the average in yield.

Pittsburg.—This is a new mine, to which we have made occasional reference. Prospecting was commenced upon it more than a year ago, but no systematic work was done until the present season. Crushings of rock, amounting to 40 loads, were taken out above the water line some time ago which yielded about $2,500. Since that time a horse whim has been erected, a pump put in, and the work of sinking the shaft continued.

North Star.—We regret to say that work in the North Star has been entirely suspended, and the pumps have been taken out of the mine.

State Ledge.—This mine (Perrin's) is looking very well at the present time. It is estimated that rock from the middle ledge will pay $18 to the ton and the upper ledge is still better. Crushing is done by water power.

Eureka.—The total depth of the main shaft is 1,260 feet on the incline, and from that depth a cross cut is now being run to strike the ledge.

Prospect Company will commence work again in a few days. This company consists of miners and merchants of Grass Valley. There should be four or five such companies here, since there are many ledges in the district that pay if proper work is done upon them.

Empire looks well underground, and has yielded well during the month. Something like $10 worth of gold exclusive of sulphurets, has been taken out during the last 24 days.

Coe is prepared any day to commence the operation of taking out quartz, though at present pumping and keeping the mine in order is all the actual work being done.

Omaha.—The shaft is now down 160 ft., and the ledge all through that depth shows well in free gold and heavy sulpherets.

Idaho continues in its regular way, having varied nothing for the last two months. Work in putting in the new pumps is going ahead, and in a few weeks the mine will be ready for all underground water contengincies.

PLACER COUNTY.

Iowa Hill.—Cor. Placer *Argus:* The old Clark claim has been bought by Messrs. Bolwell, Fuller & Prichard, of Omega, Nevada county, and is being fitted up in readiness to commence washing as soon as the rainy season sets in. It no doubt will prove to be one of our richest claims. It it is located near Independence Hill, and empties into the North Fork of the American river. The Occidental has been recently purchased by S. R. Kidder, of Dutch Flat; he is at present engaged in running a sluice tunnel 250 ft. in length, 7½ ft. high, and 6 ft. in width, with a grade of 8½ in. every 12 ft.; at present he has 150 ft. completed, and expects to finish the balance before winter; he proposes to use pipe 15 in. in diameter, with a pressure of 300 ft.; the width of his sluices will be 4 ft. The Anglo-American, located on the banks of Indian cañon, adjoining the Enterprise Co., and owned by Entwistle, Worsely & Watts, is also being put in readiness for operations as soon as water arrives. They will use 4-ft. boxes, with a grade of 12 in. to the box; their pipes will be 11 in. in diameter, 1,500 ft. in length from the telegraph to the bank, with a pressure of 300 ft. The Morning Star Co., which heretofore has been used for drifting purposes, is being extensively fitted up for hydraulicing this winter. They propose to use boxes 5 ft. in width and from 1,000 to 1,500 in. of water; dimensions of pipes I have not ascertained, but they will undoubtedly be large.

SIERRA COUNTY.

Oak Ranch.—Mountain *Messenger*, Oct. 3: The Oak Ranch tunnel is now in about 900 ft., and the company expect to strike gravel in a few weeks.

Monitor.—A freight team recently brought up from Marysville a new hydraulic monitor for Thomas Beard, of Eureka. It is one of the large kind.

Not Sold.—We understand that the report that Col. Baker had sold his diggings at Gardner's Point was untrue.

Burleigh Drill.—Wm. Hanly, of Alleghany, has put a Burleigh drill in operation in his tunnel, below that place.

SONOMA COUNTY.

Mining Items.—Russian River *Flag*, Oct. 1: The Blue Jacket mine has a 100 foot tunnel now, and another higher up the hill has been run in 30 feet.

The Flagstaff is in trouble. The time of the bondholders was up last week, or the week before, and Gen. La Grange came from below, prepared to take the mine from Messrs. Bell & Co. Just as the matter was drawing to a close, Mr. Parks, of Santa Rosa, appeared on the scene as a claimant to the Flagstaff. This stopped the trade, and matters are now in an awkward fix. Bell & Co. call on La Grange & Co. to pay a forfeit; La Grange wants the mine, but not a lawsuit, and Parks disturbs the peace and calls aloud for justice.

The Missouri mine employs 16 men. The Kentuck is keeping five men at work in the tunnels. Ore is being hauled from this mine over to the Missouri, where it is roasted in the retorts. The yield from the bench—only two retorts are running now—is 23 flasks a month. The running expenses are only half the income.

The Rattlesnake furnace (Lockhardt) was completed September 26th, and fired up the same day. Enough adobes have been made to run the furnace all winter. One hundred and twenty men are employed.

The Sonoma is still running low grade adobes, and is now hardly making expenses. But good cinnabar has been struck in the lower tunnel. Gen. Dodge, of San Francisco, owns a controlling interest in the Sonoma, and holds the stock at $5 a share.

The furnace that reduces ore for the Ida Clayton and the Yellow Jacket had its first clean up last Friday. The latter mine has a 90-foot shaft, one tunnel 110 feet long and another 40 feet long. One was reached at 100 feet from the surface. The former is eleven or twelve miles (air line) from Healdsburg and within three miles of St. Helena mountain. Work progresses in the three-face cuts and the shaft. The ore is low grade, but will pay. A hundred tons of adobes have been made and about 500 tons pay rock piled up. The ore and adobes are being hauled from these mines, five teams being steady at work. The ore house (80x60) is intended to hold the entire winter supply. Nearly enough ore and adobes have already been obtained to keep the furnace running till spring. Twenty-six white men and twenty-four Chinamen are working in the two mines.

The Mt. Jackson Mines.—The ledge has been struck on the Mt. Jackson mine at a distance of 210 ft. from the mouth of the tunnel. The ledge is clearly defined, but its width is not yet determined, although the tunnel has entered it 11 ft. The rock is said to carry good pay ore. The furnace will be completed this week and reduction will immediately begin. The company have four houses and an office built and are making preparations to continue work through the winter without interruption.

TUOLUMNE COUNTY.

Patterson Mine.—Tuolumne *Independent*, Oct. 3: This mine will be in full operation again in about a week. The new hoisting works are being put up, which made it necessary to stop the mill. This new machinery will also be used to run the pumps, the water coming almost too free to hail, as heretofore. Orders have been given to sink the main shaft 400 ft. deeper, to still further develop the mine.

Golden Sulphuret Mining.—The shaft being sunk on the northern boundary of the Golden Gate, and adjoining the Golden Sulphuret Mine, shows excellent sulphurets and free gold. It is the opinion of leading quartz men in the county that a revolution in this kind of mining is about to take place—the rich sulphurets of the former mine selling in the city for $1,650 per ton, which were heretofore run off as worthless, have entirely opened the eyes of mill men of the county. Now that we know the value of this material and the secret of saving it, a large increase in the revenue of quartz mining will soon show itself, as there are a great many mines in the county of this character worked and unworked. In fact they will prove the lasting and most valuable ones of any. Concentrators and shaking-tables are becoming quite fashionable, and will pay handsomely for the outlay invested in them. What the county most needs now is custom works for manipulating sulphurets after they have been saved, instead of shipping them below to the great loss of the owners.

Nevada.

WASHOE DISTRICT.

Ophir.—Gold Hill *News*, Oct. 3: The ore breasts on the 1,300-ft. level, both north and south, are looking splendidly and yielding rich ores. The bottom of the north winze, No. 1, is still in good ore. The south winze, No. 2, is also in rich ore; in fact the entire level is showing better every day. The ore breasts on the 1,465-ft. level continues to improve both in the quantity and quality of the ore extracted. The ore in the east cross-cut from the south drift on the 1,465-ft. level not only continues to hold out, but is giving better promise than ever of a large and permanent body of ore and the development of a paying mine. Daily yield 60 tons of ore, keeping the Empire State mill steadily running and accumulating a surplus in the dumps. The Nevada mill will commence crushing ore from the mine to-morrow.

Sierra Nevada.—Sinking the new shaft is making splendid progress, it having passed through the soft clay body, recently encountered, into soft rock that blocks out finely. Daily yield 65 tons of ore. This ore is taken from the old upper workings, which promise a fine yield for many months. The mill is kept steadily running crushing ore from the mine.

Woonville.—Sinking the north winze from the 300 to the 400-ft. levels is making rapid progress, following the foot-wall of the ledge, the ore still holding out strong and of fine quality. The mill is kept running on ore from the mine, and will clean up so as to determine the result of the crushing about the 3d inst.

Dayton.—The ore breasts between the first and second station levels are looking finely. The second station level is yielding the usual amount of good ore, while the ore stopes on the third station level have greatly improved both in looks and yield during the week.

Globe Consolidated.—The ore struck last week in the face of the main west drift on the 400-ft. is showing a decided improvement in both looks and quality. Almost the entire face of the drift is now in ore of a good quality, with a strong flow of water that considerably retards the development coming from the breast. This is an important discovery, as it lies to the westward of any of the ore developments heretofore made in this mine, and is in an entirely new and unprospected portion of the mine.

Lee.—The ore in the face of the northwest drift is about 3 ft. in width and of a fine quality. The upraise, No. 1, from this drift is up 28 ft., following the foot wall of the ledge. The ore in the face of this raise is five ft. thick, and is all being saved for milling. The southeast drift, on the cross-vein, is in 34 ft., the quartz-streak having widened to about three ft. of good milling ore. The Ramsdell mill commences crushing ore from the mine to-day.

Sutro Tunnel.—To-day the main tunnel, from the mouth of the face of the header, is completed to the distance of 7,000 ft., which, added to the 409 ft. which was drifted from the bottom of shaft No. 2 before it filled with water and was abandoned, gives a total length of 7,408 ft. The shafts along the line of the tunnel are all abandoned; they are to be sunk no deeper, and the machinery employed will be sold. The entire sources of the company will hereafter be concentrated upon driving the tunnel at the main header. A contract is about being let for 1,800 ft., which will carry it to within 300 ft. of shaft No. 2.

Julia.—The hoisting engine was started up during the fore part of the week, everything working with perfection. Draining the shaft was commenced at once, and this morning the water is reduced to within two ft. of the 1,000-ft. station.

Chollar Potosi.—Three cross-cuts are being run at different points from the main south drift on the fifth station level, for the purpose of prospecting the ledge and determining its value. Daily yield of ore from the old upper workings, 100 tons, the assay value of which is $29 per ton.

Bullion.—The main north drift on the 1,700-ft. level from the Imperial shaft is still driven vigorously ahead, following the west clay wall of the ledge, which is smooth, well-defined and promises a strong concentration of the ore vein on that level.

Overman.—A very promising ore development was made day before yesterday in the north drift on the 1,200-ft. level.

Knickerbocker.—Sinking the shaft is making good progress, the bottom in soft working ground. It is now down 724 feet.

Crown Point.—The ore breasts and stopes throughout the entire mine are looking finely and yielding the usual amount of ore. The face of the east cross-cut on the 1,500-ft. level is still in fine ore. The bottom of the east development winze is also showing fine ore. Sinking the main incline is making good progress.

Daney.—The quartz and ore in the face of the main west drift on the 400-ft. level is growing strong and of a more promising character every day, and it is confidently expected that the main ledge will be reached during the next four days. The flow of water from the face is quite strong.

California.—The north drift, on the 1400-ft. level from the Consolidated Virginia shaft, will connect with the south drift from the Ophir, on the same level, in about a week's time, thoroughly ventilating the mine to that depth, and placing everything in full readiness for cross-cutting and opening both the 1300 and 1400-ft. levels.

Hale & Norcross.—Blasting out for the 2,100-ft. station in the main incline is making steady progress. Daily yield, 40 tons of ore from the old upper levels.

Savage.—Cross-cutting on the 2,000-ft. level is still vigorously prosecuted, with some very favorable prospects.

Awards of Premiums at the State Fair.

We give below a list of the premiums awarded at the Fair of the State Agricultural Society, omitting those given to stock exhibits:

FIRST DEPARTMENT—CLASS I—AYRSHIRES.

Best cow 4 yrs old and over, Robert Beck; Kitty Clyde, $40.

Second best cow 4 yrs old and over, L. A. Upson; Flora McIver, $20.

Best cow 1 yr old, L. A. Upson; Bonnie Jesn, $15.

CLASS I—POULTRY.

Bassett & Miller, Sacramento; best lot of light Brahmas, $5.

F. S. George, Sacramento; best lot black Spanish, $5.

Peter Burns, Sacramento; best lot black Polands, $5.

Bassett & Miller, Sacramento; best lot black-red games, $5; best lot Brahmas, special premium recommended.

John Herring, Sacramento; best lot dark Brahmas, $5.

W. J. Prather, Woodland; best lot Bronzed turkeys, $5.

J. C Mills, Centerville; best lot Narraganscett turkeys, $5.

W. J. Prather, Woodland; best lot Rouen ducks, $5.

E. B. Gilbert, Sacramento; best lot gray ducks, $5.

Bassett & Miller, Sacramento; best lot Brahma chicks, $5; best lot duck winged game Bantams, $5.

John F. Friggins, Woodland; best lot Houdans, $5.

W. J. Prather, Woodland; best buff Cochins, $5; white Cochins, $5; black Cochins, $5; partridge Cochins, $5; white Polands, $5; hearded golden Polands, $5; golden Sehright bantams, $5.

C. H. Theis, Sacramento; best lot black Javas, $5.

J. B. White, Sacramento; best lot golden spangled Hamburgs, $5.

Jerome Davis, Sacramento; best lot silver spangled Hamburgs, $5.

A. Greer, Sacramento; best lot frizzled fowls, $5.

R. Cowne, Sacramento; best lot Dominique fowles, $5.

Bassett & Miller, Sacramento; best lot light Brahma chicks, $5.

Bassett & Miller, Sacramento; silver duck-winged game bantams, $5.

SECOND DEPARTMENT—CLASS I.

J. M. Keeler & Co., San Francisco; one Kripp engine, honorable mention and dip.

Huntington, Hopkins & Co., Sacramento; one saw gummer, $2.

George H. Grant, Sacramento; best fire extinguisher, dip.

Treadwell & Co., San Francisco; portable steam engine, dip.; best imported engine, dip.

Baker & Hamilton, Sacramento; best display general machinery, gold medal recommended.

CLASS II.

Laufkotter Bros., Sacramento; sweep horse-power, $10.

Baker & Hamilton, Sacramento; St. Louis corn sheller, dip.; lawn mower, dip.

Byron Jackson, Sacramento; self-feeder and elevator, $50 recommended.

M. C. Hawley & Co., Sacramento; threshing machine, dip.

Huntington, Hopkins & Co., Sacramento; one lawn mower, dip.; gopher trap, $5; post hole augur, dip.; vegetable cutter, dip.; lawn sprinkler, $5.

Baker & Hamilton, Sacramento; Pitt's Buffalo threshing machine, cider mills and press, lock lever hay and grain rake, four hay and straw cutters, two corn shellers, two lawn mowers, one lawn sprinkler, one champion post hole augur; first premium awarded by the committee.

Baker & Hamilton, Sacramento; one header—California manufacture—Gem broadcast seed sower, sweepstakes harrow, Grange cultivator, wrought iron cultivator, sweepstakes road scraper, Eureka sweepstaks gang plow, spring market and road wagon; first premium awarded by the committee.

Baker & Hamilton, Sacramento; Buckeye cider mill and press, dip.

M. C. Hawley & Co., Sacramento; Buckeye cider mill and press, dip.

Baker & Hamilton, Sacramento; horse rake, dip.

Keller & Co., Sacramento; Continental straw cutter, dip.; Eagle hay press, $40; circular saw mill, dip.

CLASS III.

Baker & Hamilton, Sacramento; Sweepstake Plow Co.'s headers, $50.

W. Guttenherger, Sacramento; field roller and crusher, $10.

Baker & Hamilton, Sacramento; Sweepstaks Plow Co.'s harrows, $50.

M. C. Hawley & Co., Sacramento; two-horse broadcast sowing machine, dip.

Keller & Co., Sacramento; broadcast seed sower and cultivator, dip.

Baker & Hamilton, Sacramento; self-raking and reaping machine, dip.; Sweepstakes Plow Co.'s Gem broadcast sowing machine, $10; Buckeye reaping and sowing machine, dip.; one-horse cultivator, dip.

Mattison & Williamson; cultivator, California manufacture, $10.

Keller & Co., Sacramento; double shovel plow, dip.

Treadwell & Co., San Francisco; headers of Eastern manufacture, dip.

CLASS IV.

Baker & Hamilton, Sacramento; French burr stone farm feedmill, dip.

Nash, Miller & Co., Sacramento; grain separator and fanning mill, dip. and $5.

W. C. Nelson; windmill $25.

A. Hart & Co.; farm gate, $15.

V. S. W. Parkhurst, San Francisco; best platform and counter scales, dip.

John Wilkie, Sutter county; machine for applying bluestone to seed grain, dip.

H. M. Cameron, Chicago; champion beehive and combined feeder and ventilator, dip.

Huntington, Hopkins & Co., Sacramento; platform scales, honorable mention.

CLASS V.

J. M. Keller & Co., San Francisco; Sluthour pump, $20.

Laufkotter Bros., Sacramento; double acting deep force pump, $20.

Huntington, Hopkins & Co., Sacramento; farm road scraper, $5; cabbage cutter, $2.

F. J. Whipple, Placer county; rectangular churn, dip. and especial mention.

A. Parker, Hicksville; Crane's washing machine, $5.

A. Callahan, San Francisco; complete washing machine, honorable mention.

M. K. Barrow, San Francisco; double acting washing machine, dip.

Baker & Hamilton, Sacramento; Sweepstakes Plow Co.'s farm road scraper, $5.

Keller & Co., Sacramento; best hay seeder, $50, recommended.

Hawley & Co., Sacramento; churns, diploma.

Laufkotter Bros., Sacramento; apparatus for raising water for irrigating purposes, $20.

A. P. Smith, Sacramento; step-ladder for picking fruit, special premium recommended.

J. M. Keller & Co., San Francisco, Ryder's American fruit-dryer, special premium recommended.

CLASS VI.

Baker & Hamilton, Sacramento; Sweepstakes Plow Co.'s gang plow, best on exhibition, $100.

C. Myers, Marysville; sub-soil plow, $20.

Wm. B. Reedy, Sacramento; stubble plow, $10; gang plow, dip.

M. C. Hawley & Co., Sacramento; one John Deer's gang-plough, dip. and special premium recommended.

Treadwell & Co., Sacramento; sod plow, $10.

M. C. Hawley & Co., Sacramento; side-hill Plow, dip.; one-horse plow, dip.

Baker & Hamilton, Sacramento; Scotch clipper steel plow, dip.; Monitor cast-iron plow, dip.

CLASS VII.

Daniel Mason, Sacramento; trotting wagon, $15 and diploma.

Dr. Lyford, San Francisco: apparatus for embalming dead bodies, apparatus for ventilating and disinfecting burial vaults, apparatus for propagating oysters, special premium recommended.

REPAIRING MIRRORS.—To replace the small patches of quicksilver often found removed from the back of looking-glassee, cleen the damaged spot by very careful rubbing with fine cotton until there is no traco of grease or dust; then with a point of a knife cut the size of the required piece of the silvering off another glass; a small globule of mercnry (the size of a pin's head for a surface the size of the finger nail) is dropped npon the cut piece. The mercury peuetrates as far as the cut, and allows the piece to be removed. It is then gently pressed on the spot with a piece of cotton.

No pillar or support of brick or stone should ever exceed in bight twelve times its least thickness at its base.

Good Health.

Unaired Chambers.

I pass soms houses in every town whose windows might as well be sealed in with tbe walle for any purpose tbsy have bad but to let in the light. They are never opeaed, enmmor or winter. In winter it is too cold; in the summer the flies stray in, or, if they are netted, the dust sifts through the nets. Now I can tell a person who inhabits such chambers when I pass him in tbe etreet—there is euch a smell about his clothing. I always wisb for a sniff of cologne or hartshorn or burnt feathers, or something of tbs sort, to "take tbe taste out." A house that is never aired bas every nook and corner filled with the stale odors of cooked meats, boiled vegetables, especially cabbage nad onions, which, as the weeks go by, literally reek in their hiding places. Who has not wished sometimes to bang a new servant's clothing out of doors some frosty night until it shonld be thoroagbly aired? But I have seen the fins ladies eome swooping into church, with their velvets and silke, when said velvets and silks gave unmistakable evidence of having been housed in juet such shut-up chambers. Oh, what a tale that odor of cabbage and pork tells abont the lady's style of housekeeping! Ths very garments of the children tell the same story of uncleanliness. It is bad to have unwashed clothes, but there may be aa excuse for it. But what excuse esn there be for unaired ones, when air is so cheap and free? Thore is dosth in such nnaired chambers. Bettor a swarm of flies or a clond of dust, better frost aad snow in a room, than these intolerable smells.

Doar girls, the first thing in the moruing, when yon are ready to go down stairs, tbrow open your windows, take apart the clothing of your beds, and let the air blow through it as hard as it will. There is health and wealth in such a policy. It helps to keep away the doctors with their loag bills. It helps to make your eyes sparkle and your cheeks glow, and to make others love yonr presence. Girls who live in these close, shut-up rooms, can only be tolerated at the best in any circlo.—*Country Gentleman.*

WEAR AND REPAIR OF THE BRAIN.—The notion that those who work only with their brains need less food than those who labor with their hands has heen the cause of nntold mischief. Students and literary men have often been the victims of a slow starvation, from tbeir ignorance of tbe fact that mental labor causes greater waste of tissue than muscular. According ing to a careful estimate, three hours' hard study wears ont the body more than a whole day of work on the anvil or on farm. "Without phosphorus, no thought," is a German saying; and the consumption of that essential ingredieat of the brain increasos in proportion to the amount of labor whicb the organ is required to perform. Tbis wear and tear of the brain are easily measured by careful examination of the salts in the liquid excretioas. The importance of the brain as a working organ is shown by the amount of blood it receives, which is proportionally greater than that of aay otber part of the body. One-fifth of the blood goes to the brain, though its average weight is only one-fortieth of the weight of the body. This fact alone would be sufficient to prove that brain-workers need more food and better thau mechaaics and farm laborers.

OVERWORKING THE BRAIN.—Softening of the brain is becomiag a more common disease than formerly; as it is ntterly incurable, attention should be given to its canses. The softening is caused by an inflammatory condition or a gradnal degeneration of the substance of the brain, arising from intense mental excitement, as a result of study, of the use of spirituous liquors, or allowing the mind to dwell on one subject unpleasantly, especially when there is no real canse, or conjectured injuries, or injustices and the like, moping over them, cherishiag thonghts of them. This lameatable malady comes on at one time with a sudden head or ear ache, at another with difficulty of speech, or nmmbness, or convulsions, or paralysis, or actual insensibility; at other times there is simply a decline of the power of the senses, sight, hearing, speech, and tho mental powers generally. The eame diseaso is cansed by the want of something to do, when there is no compulsion to mental effort or muscular exertion. To ameliorate a malady arising from causes so diametrically opposite, antipodal means should be employed—less work to the overworked, more work for those who have nothing to do.—*Hall's Family Doctor.*

SUNSHINE AND SLEEP.—Sleepless people—and there are many in America—should conrt the sun. The very worst soporific is laudanum, and the very best, sunshine. Therefore, it is very plain that poor sleepers should pass as many hours as possible in sunshine, and as few as possible in the shade. Many women are martyrs, and yet they do not know it. They shut the sunshine out of their houses and their hearts, they wear vails, they carry parasols, they do all possible to keep off tho subtlest and yet most potent influence which is intended to give them strength and beauty and cheerfulness. Is it not time to change all this, and so get color and roses in yonr pale cheeks, strength in your week backs, and courage in your timid souls? The women of America are pale and delicate; they may be blooming and strong, and the sunlight will be a potent aid in this transformation.

Useful Information.

HOW THE EYE IS SWEPT AND WASHED.—For us to be able to see objects clearly and distinctly, it is necessary that they should be kept clean. For this purpose it ie furnished with a little gland from which flows a watery fluid (tears) which is spread over the eye by the lid, and is afterwards swept off by it, and runs through a hole in the boae to the under surface of the noso, where the warm air, passing over it while breathing, evaporates it. It is remarkable that no snch gland can be found in the eyes of the fish, as the element in which they live answers the same purpose.

If the eye had not been furnished with a liquid to wash it, and a lid to sweep it off, things would appear as they do when you look through a dusty glass. Along the edges of the eyelids there are a great number of tubes and glands, from which flows an oily substance which spreads over the surface of the skin, and thus prevents the edges from being sore and irritated, and it also helps to keep tears within the lid. There are also six little muscles attached to the eye, which enables us to move it in every direction; and when we consider the different motions they are capable of giving to the eye, we cannot but admire the goodness of Him who formed them, and thus saved us the trouble of turning our heads every time we wish to view an object.

A SIMPLE MODE OF ANALYSING SOILS.—M. Schlosing gives the following simple process for separating the clay in soils from other constituents, and consequently for determining the quantity of the former present. The earth is thrown in water and the calcareous matter eliminated by means of hydrochloric or other suitable acid. The carbonate of lime and humic acid found in nearly all vegetable earth, hinders the clay from remaining in suspension in the water and it is hence precipitated. By treating the liquor with ammonia, the humic acid is removed. The residue is composed of sandy matter and clay; but the former falls to the bottom, leaving the clay in suspension in the liquid, from which it may be separated by decantation. This method, though almost mechanical, it is said will prove of much value to agriculturists. M. Schlosing has found that earth, considered argillaceous, in some cases contained little over 2 or 3 per cent. of clay, while others, supposed to be composed almost entirely of that substance, contained but 30 per cent.

HARDENING STEEL TOOLS. — The following composition, suggested by the chemist Kulicke, has been employed with success at Saarbrucken for restoring burnt steel to its primitive condition; and as it affords a peculiarly hard metal, it is also used for temporing steel tools that are too soft, or may have become so by use, as chisels, saws-blades, etc. Burut steel, heated to a cherry red, and forged somewhat ou an anvil, is plunged in a well-mixed doughy mass (in a box near by) composed of tartaric acid, six ounces; cod oil, 30 ounces; charcoal power, two ounces; bone bleck, eight ounces; beef tallow, 10 ounces; yellow prussiate of potash, five ounces; and burnt hartshorn, three ounces, and is then completely treated. Small articles of cast-iron such as wheel-boxes, axle-bearings, etc., may be successfully case-hardened by being plunged red-hot into a mixture of 10 buckets of urine, five pounds of whiting and four pounds of salt.—*Scientific American.*

TO RENDER A CESSPOOL INODOROUS.—The contents of a cesspool may be rendered comparatively inodorous by frequent addition of plaster, or ground unburned gypsum, or diluted oil of vitriol, or solution of copperas. Probably the easiest way of using the contents for manure is to throw fine earth into the vault until a semi-liquid mass is formed, and to scoop this out and cover it with a quantity of dry soil gathered in readiness for it. The earth absorbs all the liquid and all the gaseous matter, and if kept covered from rain for a few days, it will be in excellent condition to spread over meadows or fallows to be prepared for fall crops.

AN ALCOHOLIC VARNISH THAT WILL ADHERE TO METAL.—In order to make alcoholic varnish adhere more firmly to polished metallic surfaces, A. Morell adds one part of pure crystallized boracic acid, to 200 parts of the varnish. Thus prepared it adheres so firmly to the metal that it cannot be scratched off with the finger nail; it appears, in fact, like a glaze. If more boracic acid is added than above recommended, the varnish loses its intensity of color.

TO RESTORE PAPER.—It is often a source of annoyance, in using forms that have been printed on writing-paper, to find that the ink from the pen will not flow in certain places, owing to grease-marks from the printer's finger in laying on the sheet. If a piece of common white india-rubber be lightly rubbed over such places, the grease will be taken away, and the writing done as easily as on any other part of the sheet.

A CORRESPONDENT asks how can melted glue be kept liquid when cold. Ans. Take best pale glue 2 lbs., soft water, 1 quart, dissolve in a warm bath; after cooling add (slowly) 7 ozs. nitric acid. When cold, bottle off.

To make an imitation of coral, color prepared chalk with sesquioxide of iron or rose pink, pass through a sieve, and make into a paste with white wax.

Domestic Economy.

How to Make Soup.

A correspondent of the Spriagfield *Republican* says: I never buy fresh meat to make a soup, unless it be for company. The bones and bits of meat left from the "roasts" and "broils" are sufficient.

I take a slice of salt-pork, and cutting it up small, I put it in the bottom of my soap kettle with three large or six small onions sliced, half a tea-cup of water, all my bones and scraps of meat (but no fat whatever), two heaping spoonsfull of salt and a small quarter tea-spoon of pepper. Let all these simmer ten minutes or over. Stir them often, but do not let them scorch, and, when just ready to dry up, pour on five pints of cold water. Add two good-sized carrots and a turnip cut in slices, and let all boil together moderately for an hour or two. (If you have a large proportion of meat on your bones, an hour will make it.) Strain it through a sieve, and skim off the fat, if any, and it is fit for the every day table. While boiliag, the kettle must be covered tight, to keep it from boiling away. I like to make my soup after breakfast and set it away, as then, by dinner-time, the fat which may be on it will have hardened, and is easily skimmed off. Any grease floating on a soup is unpardoable. Send it to the table boiliag hot, and if you add a little boiled macaroni, rice, or barley, or a few green peas, or slivers of striag beans, or even of deepised carrot, it will improve it. When you have tomatoes, celery-tops, parsnips, a bay-leaf, a bit of thymo, green-pea hulle—anything—put it in to enrich and complicate the flavor. As the wife of a distinguished Cambridge poet, who is very particular about his dinner, said to me, "Everything goes to make a soup—like cologne." Most housekeepers make awful preparations in getting up a soup—a whole shin of veal, boiled all day, etc. But after a few experiments, the housekeeper will find that the above recipe is cheaper, quicker and quite as good.

The Secret of Fried Potatoes.

"G. B. B.," writes to the Spriagfield *Republican* a bit of information that willl interest many: Saratoga potatoes, the poetry of common life, and costly charm of Delmonico's and Parker's, can be made in perfection in any kitchen, by the use of very simple apparatus, consisting of a sharp blade set slantiug into a wooden trough with a narrow slit in the bottom, two wire screens or sieves, and a common spider. Select eight large potatoes, pare them, and slice very thin with the cutting machine, soak them in cold water for two hours, and stir common table salt into the water, one teaspoonful to a quart, and allow them to remain in the brine half an hour longer. Pour them npon the screen to drain, and put on a spider, with a pound of clear lard, over a brisk fire. Wipe the sliced potatoes dry on a towel, wait until the lard is smoking hot, and pour a large plateful into the spider. The result is like a small sea in a white squall; and now the cook shows the artistic soul which every votary of that nohlest of the arts must possess to be worthy of the name. Patient and calm, with steady and incessant motion of the skimmer, she prevents adhesion of any too affectionate slices, and watches carefully for the tender blush of brownnese to appear. Slowly it creeps and deepens natil it outrivals the hue of the fragrant Havana. Haste then takes the place of caution, lest any martyrs burn for the protection of others; and they must be quickly spread upon another sieve to drain until dry and greaseless enough for the feirest fingers; then served hot, to melt away like a kiss on sweet lips, with a dying crackle, like the fallen leaves in autumn.

TO PRESERVE GRAPES.—Pluck the clusters carefully, remove those that are green or bitten by insects or blasted, and tie them to a pole about 10 feet long and so firm as not to bend much beneath the weight. Hang the poles with the clusters suspended in a loft or chamber where there is a free circulation, and there let them remain till freezing weather, looking over them occasionally and removing any that have begun to decay. Then pack in dry sawdust in dry shallow boxes, and keep in a cool, dry cellar. The French often keep them a number of months by dipping them in a thick white-wash, which on drying covers stem and fruit with a thin, white crust and excludes the air. Any one who knows a better way than those will confer a favor on our readers by communicating it to them.

BOILED BREAD PUDDINGS.—Crumb your stale bread in a pudding pail and cover with sweet milk, and set by the stove to warm and soft n. Then to every quert of the mixture add two well beaten eggs, a cup of sugar, and a heudful of raisins or sweet dried fruit of any kind. Do not have your pail full, as it needs some room to rise. Put the cover on tightly and set it in boiling water, and do not allow it to stop boiling till done. If you try that once you will never make a baked pudding again.

FRIED SWEET POTATOES.—The evening before they are wanted peel and slice them, lay them in a stew-pan and sprinkle sugar between the layers of potatoes; pour on water enough to cover them, and set the stew-pan on the stove. In the morning by the time you are ready to fry them, they will be cooked just enough; fry in hot lard to a light brown on both sides.

San Francisco:

Saturday Morning, Oct. 10, 1874.

TABLE OF CONTENTS.

GENERAL EDITORIALS.—A Curiona Experiment; Academy of Sciences; Tap and Faucet for Beer Casks, 225. California in the Pliocene Epoch; Antimony — Plumhago Orucihles, 232. Sharpahinned Hawk; Aboriginal Botany of California, 233. The Gold Hill Tragedy; General News Items; Patents and Inventiona, 236.

ILLUSTRATIONS.—A Curious Experiment; Schiffer's Faucet for Beer Casks, 225. Sharp-shinned Hawk, 233.

MEOHANICAL PROGRESS.—A New Kind of Glass—"Bone Glass;" A New Tide Wheel; A New Locomotive Engina; School of Millwrights; Compressed Air Machinery; A New Mechanical Separator; Cast Nickel Plates, 227.

SCIENTIFIC PROGRESS. — Singular Facts in Regard to Electricity; The Light of Coggia'a Comet Polarizad; Large Magnitudes Difficult of Comprehension; On the High Temperatures Actually Possihla; The Action of Tides on the Sea-Bottom; Microscopic Examinations of the Air; The Correlation of Forcea; New Fulminate, 227.

MINING STOCK MARKET.—Tahla of Daily Salas and Prices and Comparative Prices for the Week; Noticas of Assessments; Meetings and Dividends; Raview of Stock Market for the Weak, 228.

MINING SUMMARY from various counties in California and Navada, 229.

GOOD HEALTH.—Unaired Chambars; Wear and Repair of the Brain; Overworking the Brain; Sunshine and Sleep, 231.

USEFUL INFORMATION. — How tha Eya is Swept and Washed; A Simple Mode of Analyzing Soils; Hardaning Steel Tools; To Render a Casspool Inodorona; An Alcoholic Varnish that will Adhere to Metal; To Restora Paper, 231.

DOMESTIC ECONOMY.—How to Make Soup; The Secret of Fried Potatoas; To Preserva Grapes; Boiled Bread Puddings; Fried Sweet Potatoes, 231.

MISCELLANEOUS.—Professor Carr and the University; Iron Works in the United States; Utilizing Grape-stones; The Ramsdell Mill; Hardwood Lumher; A Big Lathe; Impermeabla Paper, 226. Awards of Premiums at the State Fair, 230. Boat Building; A Success; Technical Schools; The Big Tailings Flume; New Pump; Working Coal in Depth; Kentuck Hoisting Works; Winter Supplies; The Progresa of the New Mill, 234.

THE Virginia and Truckee railrosd company have about 225 men at work hetween Washoe City and Steamhoat, on the Reno Division, grading off the high places on the line and making the road as level as possible, so that the locomotives hauling freight hetwoen Reno and Carson can pull one or two cars more than heretofore, without having to double up at the steep grade near Washoe City.

MAD BULLS IN NEW YORK.—As a drove of Texas cattle were being driven through New York, on Mouday last, and when near the city Hall, on Chatham street, a bull became furious and broke away, followed hy several others. Tbey dashed furiously through the streets, and hefore they conld be secnred injured more or less severely 40 persons—several quite seriously.

A TERRIBLE cloud hurst occurred on Friday last near Mirage statiou, ou the C. P. Railroad, by which the rosd was so washed away that two engines attached to the Western bound train were precipitated into a washway. Both engineers were killed and the engines hadly smashed up; but no passengers were injnred.

BEAR GULCH.—The recsnt discovery of new placers at the mouth of Bear gulch, Montana, bids fair to prove one of the most important yet made in that section of the country. Five claims are now being worked with the most flattering results, the pay heing from $12 to $15 per day to the man.

AT A LOSS.—The connectiou between the up-raise in the Sierra Novada mine and the tunnel at the old Sacramento chimney has not yet been made. There wae an error somewhere in the work, but a new survey has heen made and exact bearings obtained.

WATER. — The flow of water into the main ehaft, at the 500-fuot levsl in the Utah mine, continues in great volume. In addition to the quantity pumped, 400 tanks, containing 1,300 gallons each, are raieed daily.

THE K. K. company at Eureka intend to erect new hoisting works over tbe Skylark shaft. The coudition of the mine is very flattering.

NEW and powerful machinery is heing erected at the Justice mine, on the Comstock, and will be used in sinking the main shaft.

California in the Pliocene Epoch.

At the meetiog of the California Academy of Sciences on Mondsy last, Dr. J. G. Cooper, formerly of ths Stste Geologicel Survsy made some remarks on Cslifornia in the Pliocene Epoch, of which the following is an abstrsct:

Ths mep here exhihitsd is that of California snd Nevsde, published hy the Geologicsl Survey, and of which this new edition is issued, hy euthority of the University of Californis, and presented to ths Academy hy the chief topographer, Mr. C. F. Hoffmaun. On this there ars pinned pieoes of orangs colored paper, (chosen from its contrest with the blue and brown (tints of ths map) to represent the portions now lend, but covsred hy salt or brakish wster during tbe epoch just preceding ths sge of man. A considsrahls part of thsss slong the edge of the Coast, is, however omitted, beiug to nsr row to show on this smell scale at a distance. Probebly mnch of tho Coast rsnge wse also under water, of which no evidence from fossil remains is now left, the strats, if any were deposited, having been weshed awey.

Numerous small fresh weter lskes also existed, which hsve left deposits, especially on tho slope of the Sierra Nevada, hut not yet surveyed enough to define their limite. The Sierra must then have been much lower to ellow these lakes to stand where they would now drein out completely. Most of the stetes of Nevada and Utah were also covered by large fresh water lakes, filling what is now called the "Great Basin," and which hsve since evaporated so ae to form the salt lakes now sxisting, hy condensation of the salts always contained in lakes and rivers. This is shown by the deposits of freeh water shells at high levels ebove the present salt lakes, and the absence of selt weter fossils later than the cretsceous in the Great Besin.

Iu California, the whole great interior basin of the Sacramento and Ssn Joaquin valleys wes occupied hy brackish water, as proved by the remains of sharks and porpoises fonud by Profeseor Blake and others near Keru river. All the principal level valleys now forming our best agricultural lands were also occupied by arms of this inland sea or of tho ocean. The gulf of California extended over the desert a hundred miles or more north of its present limits.

The Sacramento basiu had other outlets besides the Golden Gate, (if that existed at all) through an inlet opening at Russian river, aud another through Santa Clara valley iuto Monterey bay. Thus many islands probably exieted, which are now joined to the main lsnd, amoug them the peninsula of San Francisco. Some of tho inlets near the coast were occupied by marshes through which the animals of that period reached the nearest islands, as shown by the remains of the fossil elephant found near this city. Similar remains fonud by Blunt and Harford, of the Coast Survey, on Sauta Rosa island, show tbat it was then either joined to the main lsnd hy dry ground or marshes, as were probably the whole inner row of islands now formiug the south shore of the Santa Barbara channel.

The evidence of all these changes is iu the remaius of marine, laud, and fresh water animals now found in the valleys mentioned, which have become more or less filled np by deposite from tha adjoining hills.

The following are the most striking forms, described hy Prof. Leidy in the "Report of the U. S. Geological Survey of the Territories," iseued lsst yesr.

A tiger (*Felis Imperialis*) ae large as the Bengal tiger, found in or near Livermore vslley, by Dr. L. G. Yates.

Wolf (*Canis Indianensis*) larger than the existing kinde, from same deposit; also found in the tertiary of Indiana, etc.

Llama (*Palauchenia Californica*) from the foothills of Merced county, found hy C. D. Voy, larger than the existing camel; also remains of perhaps another species from Alameda county hy Dr. Yates.

Buffalo (*Bison latifrons*) found in several parts of this State and the Eastern States; larger aud differing from the living form. A very perfect skull wae found by Mr. C. Brown, engineer of the Pilarcitos valley aqueduct, in excavating for thst work.

Horse (*Equus occidentalis*) of which remains are common in most of the Statee, thongh no horses existed on this continent when it was discovered by Enropeans.

Rhinoceros (*R. Hesperius*), of wbich teeth were obtained by Prof. Whitney iu Sierra Nevada.

Elephant (*E. Americanus*), one of the commonest of the great fossil animals throughout the United States.

Mastodon *M.* (*Americanus*), more rare, hut also found in many localities.

Another species (*M. obscurus*) first found in the Gulf States, and since by Dr. Yates in the foothills of the Sierra, Alameda county, etc.

A great tortoise, equal to the Galapagos species in size, hut probably of fresh water, from a lake deposit of Nevada county. This is still undescribed, heing one of the fossils obtained hy the University from the Geological Survey.

Remains of palms and other tropical trees, chiefly from the lake basine of the Sierra, were sent by Prof. Whitney to the eminent Prof. Lesquereux, to be described in one of the Geological Reports, that *ought to be* published by the State of California.

From these evidsnces we perceive that the climats of that day was tropical. The country consisted of peninsulas and islands like those of the present East Indies, resembling thsm also in climate and prodnctions. From tbe extent of water surrouuding them, there was ehundent reinfall and luxuriant vegetation, snitahle for the animals mentionsd.

It is not unlikely that some of thsse animals may have existed hefore the pliocsne epoch as well as in it, hut the explorations ere still insufficient to decide this.

Volcanic Age.

Ths tsrmination of this tropical epoch in California, wes marked (as described first by Prof. Whitney), hy enormous volcenic outhursts, which poured out grset streems of lave on the slope of the Sierra Neveda covsring entirely largs tracts toward the north. At the same tims the whols country was appsrsntly rsised hy ths elevstion of new mountain renges, and increase of old ones, causing the lakes to be drained, and their beds filled hy washings from the hills, mixed with volcanic materials. This greet convulsion no douht exterminated most of the tropical flora snd fauns of Cslifornia, although some of its representatives might heve existed later in neighboring regions, and their descendants may etill be found in tropical America. That all sre not extinct, is probable from the analogy of tertiary species elsewhere, and from the fact thet most of the marine end fresh water shells of the strsts deposited at that time are etill living, some however, only south of California.

Meny extinct lsnd animals have hsen found to have lived in Europe since the appearsnce of man on the earth, and there is strong evidence in the "Calsveras sknll" and others, that the eame fect is true of California.

It does not, however, necessarily prove that man existed in the Pliocene epoch, ss his remains may have heen huried under volcsnic outflows of later date together with Postpliocene animals, or even bones of Pliocene species mixed with them by aid of volcsnic convulsions.

Postpliocene Epoch.

The immense psriod of time thet hes elapsed since the Pliocene epoch is shown by tbe vest accumulatione of volcanic materials ponred out by Mt. Vesuvius on top of marine strata of shells, every one of the species etill living in the Mediterrauean, and therefore of late Postpliocene date. Yet history, and the evidence of human remaius go back through only a thin portion of these volcanic strata! California hefore the end of the Pliocene, was certainly badly euited for the exietence of man. The deposits found during the convulsive age, to the thickness of hundreds of feet, are themselves almost destitute of all fossils, although burying such a rich collection.

While this wss going on in California, there was probahly a great geological change taking place in other parts of the world, followed hy the Glacial Age. In this, the northern hemisphere down to ahout let. 38° wss mostly covered by ice, and the great deposit called the "Drift" found in Europe and the Eastern States.

The Geologicsl Survey proved conclusively that this depoeit of erratic houlders did not reach over California, and it is donhtful if even as far south es Vanconver's Island. Still the influence of the frozen period was no doubt exerted here in the form of extensive glaciers covering the Sierra, at least half way down their western slope, and probably tho highest parts of the Cosst Range. *Now* we have in summer a mere remnant of that great ice field, which no douht did a great part in tho excsvstion of the tremendoue cañons now cut deep helow the previous volcanic deposits of the Sierra. The thawing of such an ice field muet have acted much more rapidly in this erosion, than the comparatively slight water oourses of the present time. There is evidence slso, in the present existence of far northern land-shelle along the whole length of our Sierra Nevada, that the glacial period progressed slowly, allowiug them to spresd southward before its advance, without heing exterminsted. In Europe it has been found that man existed hoth before and after this period, living like the present Esquimanx on the edge of the perpetual snow, and advancing north again as it receded.

Present Epoch.

The eud of the reign of ice brings ne to the prsent epoch, in which there hae been very little chenge in the ontlines of the land in California, although eome changes in the fauna and flora, ae well as climate, which are yet nndetermined. The volcanic distnrhances have continued with decreasing intensity since the advent of man in the post pliocene epooh, and may have elevated considerable portions of land, especially southward, followed by increase of dryness and probahly greater extremes of temperature. A rising of land near the Arotic sea would further decrease the temperature. Judging from the continual discoveries still hsing made in the study of these latest formations of the earth's snrface in Europe and the Eastern States, we may safely eay that a vast field etill remaine open for the investigations of science in California.

CALIFORNIA LAND PATENTS ISSUED.—Washington, October 5th. Patents have been issued for the following California private land claims: Rancho Mission San Buena Ventura, in Santa Barbara county, containing 48,822.91 acres, Marie Depoli confirmee, patented August 19th, 1874; Ranebo Los Alamotos, in Los Angelee county, containing 28,027.71 acres, Abel Stearns confirmee, patented August 19th, '74.

Antimony—Plumbago Crucibles.

There has bsen considerable talk within the past few ysars, concerning ths antimony mines of this cosst, and what oonld be dons with them if the ores could be worked or sold. Now, works have bsen established in this city for the reduction of antimony ore, and althongh the propristors will buy all ths ore they can gst, they srs unable to procure snough to kesp the works running to their full capecity. It will not pay thsm to work low grede ore; it mnst at least contain 50 to 60 per csnt. antimony to be marketable. They work all the ore they csn get, hut as yst hsve never heen able to get enongh of it. Ths works are only large enough to reduce 40 tons of ore per month, hnt they will double the capscity if they can get ors. They will pay as much, or more, for the ore as people get who ship to England.

Here is a ohance then for minsrs who have bsen telking ahont their rich antimony mines to make some money ont of them, and we hope our contemporaries in the mining districts will inform them where they oen sell their ore. The works are on Bsrry street, between 4th and 5th, end Starr & Methison are the proprietors.

The works have bsen in operetion for ahout eix monthe. Most of the ore comes from Battle Mountain station, on the C.P.R.R., Nevada. Considerable money wss spent at that place, hnt the works there were a feilure. Want of facilities and lack of knowledge of the husiness were the csnses. One of the proprietors of these works was principal owner of the works at Bettle Mountain, but has men with him who thoroughly understand the business, having worked at it for many yeare in Englend. The redncticn is done in crucihlee, exactly as it ie in Englend. Esch crucible holds ahout 50 pounds of ore. The ore remains in the pot about 70 or 80 honrs. The antimony is then refined and cast into the nsuel cakes, being then "Regulns of Antimony, French Star." We saw at the works a number of these cakes, which present an eppearance exsctly similert o thoee made in England. Seversl of these cakes are exhibited at the Mechenics' Institnte Pavilion.

The antimony made here is shipped by steamer to New York, in the eame ehape as that brought from England. It is just se good as the English, and can be had here ae well aa thsre. They work the same ore here thet nsed to be shipped to England, reduced and refined there and sent hsck to this oountry. Consumers can purchase the identical article here, less cost of freight, etc.; hnt in order to find a market the proprietors of these works are compelled to ship to New York. In this roundahout way consnmers on this coast purchase their supplies, when they oonld procure the ssme thing here less cost of freight. But, nnfortunately, they seem to think thst nnless it comes from England it is not as good. Here are two English workmen, working on the English method, with the same class of ore, yet they mnst ship the home product to New York, where it is bought as English antimony, and sent hack to this coast. There ie something radically wrong in this, but until the people of this coast become impressed with the fact that our home productione are as good as foreign, this sort of think will continue.

The works run night and day. The pots in use are made here, of the beet English clsy, and will last from 70 to 80 hours in the fire. At the works wo eaw a lsrge pile of ore from a mine in Kern county. They are said to have extensive deposits and as good ore as any in the world. They do not know how it will work yet, but it ie now heing tested. The proprietors of the works do not think it is as good as that from Battle Monntain station. The works expect to turn out from 150 to 200 tons a year to start with, but they did not get ae much ore to work as they were led to expect. The conenmption of sntimony in this city is quite small, only about eight tons a year being used. It is nsed generally in type foundries, by Britania metal workers, and a large amonnt is ueed in making Babbitt metal.

They make at these same works plumbsgo crncibles, and are now grinding up plnmhago to make pots, and will test them in working the antimony. They get the plnmhago from England and the Esst, and csn make the crucihles as cheap as they are sold in this city. They have done very little in thie line as yet, hut hope to ehortly. If anyone has plnmbago of the proper sort to make into crncibles, he can sell that aleo at these works. Here, then, is a chance for those owning the plumbago and antimony mines we hear so much ahont, to prove their assertions of richness of ore, and extent of mines. The workmen employed have followed the bnsiness for many years in Englend, and can turn ont as good crncibles and as good antimony as is shipped from there. If they are patrouized, as they should he, a very important addition to our home industries will become a permanent institution.

CHART OF THE INDUSTRIAL EXHIBITION.—The proprietors of the San Francisco *Journal of Commerce* have publiehed, as a snpplement to their paper, a chart giving the interior of the Mechanic's Institute during the Ninth Industrial exhibition. The plan was well conceived and is executed in a tastefnl and workmanlike mauner. A pernsal of this chart will give to those who were debarred from the pleasnre of visiting this great fair a just conception of its interior arrangement; while the more fortunats visitors will recognize at a glance its truthfulness.

Sharp-shinned Hawk.

The sharp-shinned hawk ranges far to the north and to the south, and is met with in every State and Territory, but is more abundant in the Middle and Southwestern States than in the Northern. Mr. Audubon pronounces it "the miniature of the goshawk." Not only is this likeness in its appearance, but in the irregular, swift, vigorous, varied, yet often undecided manner of flight, which is at times, however, greatly protracted. It moves by sudden dashes, pounces upon, or strikes such objects as best suits its appetite, but so very suddenly that it appears quite hopeless for any of them to try to escape. It is often seen to descend headlong into a clump of briers, regardless of all thorny obstacles, and to emerge from the other side clutching in its sharp claws a sparrow or a finch. At other times, two or three of them may be seen conjointly attacking a golden-winged wood-pecker, which had taken position against the bark of a tree in fancied security. While defending itself from the attack of one or two of these hawks, the wood-pecker is usually vanquished by the efforts of another, which thrusts it legs forward with vivid quickness, protrudes its sharp talons and seizes the victim by the back, while it tears and lacerates. Thus wounded, it falls to the ground with its captor, where the struggle is continued; but a disengaged hawk now tears out its vitals with its claws, and the repast of the assailants commences. Young chickens are often seized by it, even in the presence of their keepers; and as many as twenty or thirty have been carried away by one hawk in as many consecutive days. Birds of various sizes, from the smallest warbler to the passenger pigeon, and small reptiles and insects, also, it is said, comprise its food.

The roosting-places of these hawks, in ordinary seasons, are in the fissures of rocks, in tall trees in isolated situations, and in precipitous declivities overhanging turbulent streams; but it cautiously retires after daylight has departed, and leaves its resting-place before the light of morning. Its nest has not often been invaded by the curious investigator into its habits at the season of incubation.

Aboriginal Botany of California.

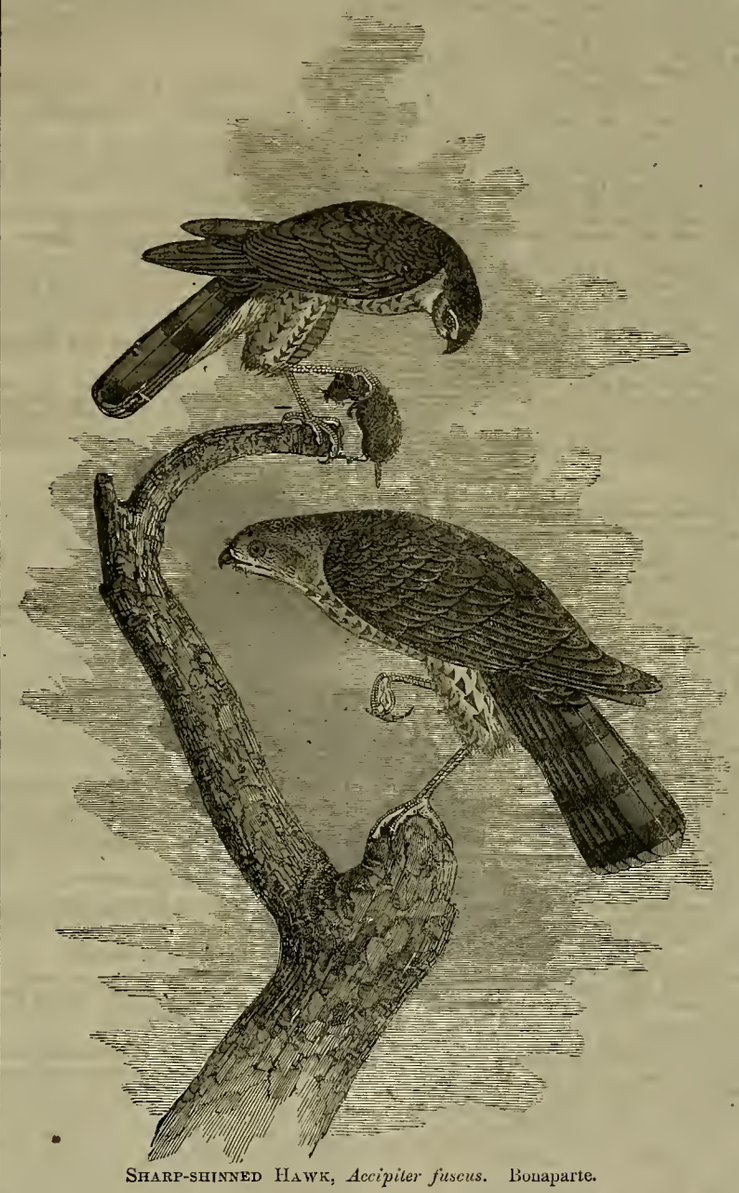
At a recent meeting of the California Academy of Sciences, the Secretary read the following interesting paper on "Aboriginal Botany" by Stephen Powers, of Sheridan, Placer county, California:

As employed in this paper the word "botany" is somewhat loosely comprehensive, and is used for lack of a better. Under it are included all the forms of the vegetable world which the aborigines use for medicine, food, textile fabrics, ornaments, etc. Among savages, of course, there is no systematic classification of botanical knowledge. Every oak, pine, grass has its seperate name; the Indian never groups individuals together, except occasionally, by adding one of the words *cha, doo, popo, com, wi, back,* (tree, bush, grass, seed, root, leaf), or something of that sort. But it is not for a moment to be supposed that the Indian is a superficial observer; he takes careful note of the forms and qualities of everything that grows on the face of the earth. True, he ascribes marvellous and impossible qualities to some plants—frequently those which do not grow in his neighborhood—but that does not blind him to their real properties. And as his perceptions of individual differentintions is nice and minute, so his nomenclature is remarkably full. I assert without hesitation that an average intelligent Indian, even if not a medicine-man, knows a much greater catalogue of names than nine-tenths of Americans. Nothing escapes him, he has a name for everything. And, indeed, there is reason. In times of great scarcity they are driven by the sore pangs of hunger to test everything that the soil produces, if perchance they may find something that will appease the gnawings of appetite. They therefore know the properties of all herbs, shrubs, roots, leaves, whether they are poisonous or nutritive, whether purgative, astringent, sedative, or what not, or without any active principle. And they have often found out these things by bitter experience in their own persons. It is surprising what a number of roots, leaves, berries and nuts the squaw will discover. She will go ont in the spring with nothing but a fire-hardened stick, and in an hour she will pick a breakfast of green stuff, into which there may enter 15 or 20 ingredients, though, of course, they are seldom reduced to this extremity nowadays. Her eye will be arrested by a minute plant that will yield her only a bulbous root as large as a large pea, but which the American would have passed unnoticed. The women are generally best acquainted with the edible matters; while the old men are the authority as to the medicines.

There are seventy-three vegetable substances mentioned in this paper. I am indebted to the kindness of Prof. H. N. Bolander, who identified for me many plants that I was unable to determine. There are a few specimens which are so scarce, nowadays, owing to the ravages of stock, or so difficult to find in flower, that it was impossible to give their scientific names.

I will take this occasion to say that there are many substances popularly called "Indian medicines" which are humbugs, and which have been fathered upon the aborigines by patent-medicine men. Whatever is set down in this paper has been learned from the Indians themselves

In regard to medicinal herbs and plants, their usages are peculiar and sometimes amusing. As the practice of medicine among them is a source of great profit and prestige, it is sought to be invested with mystery. The medicines always are crafty men, keen observers, reticent. An old doctor always clothes his art with a great deal of superstition, secrecy, and pompous solemnity. In answer to impertinent young questioners, he says his simples do not grow anywhere in that neighborhood; he is obliged to purchase them from tribes living at a great distance. I have known an old doctor and his wife, both as full of guile and subtlety as an egg is of meat, who always arose at the dead of night, crept stealthily out of camp and



SHARP-SHINNED HAWK, *Accipiter fuscus.* Bonaparte.

gathered their potent herbs, roots, etc., then returned before any one was stirring and concealed them.

The Indians referred to in this paper are the Neeahenams, of Bear River: and the flora is that of the extreme lower foothills of Placer County. Their general name for "medicine" is *wenneh*, which denotes "good;" but they frequently use the word "medicine," even among themselves.

To begin with the oaks, the species which produces their favorite acorns is the *Quercus Gambelii*, Indian name, *chacow*. They generally select those trees which have a free, coarse bark and large acorns. About the middle of October the harvest begins, when the Indian, armed with a long, slender pole, ascends the tree and beats off the nuts. A tree which has been well stripped looks as if had been scourged in a mighty hail storm. The old men generally assist in carrying them home in their deep, conical haskets, and there the squaw's duties commence. Holding an acorn on a stone, she gives it a slight tap with a stone pestle called *soonah*, to crack the shell, which she strips off rapidly. They are then dried and beaten to powder in small hollows on top of some great rock. The flour is soaked a few hours in a large hollow scooped in the sand, the water draining off and carrying away the bitterness; after which it is cooked into a kind of mush in baskets by means of hot stones, or baked as bread underground. The acorn which stands second in favor is that of the burr-oak (*Q. lobata*—Indian, *towh*). In Placer County this oak seems to be more properly *Q. Douglasii*; as its branchlets are erect and rigid. There is an oak which they call *shuheh*, which seems to be something like a cross between the white and burr-oaks, having very white and coarsely rimose bark, and glebrous, shining, deeply sinuate leaves. But Professor Bolander pronounces this also *Quercus Gambelii*. The live-oak is *haha; Q. Wislizenia, hammut*; the black oak (*Q. Sonomensis*), *hamchu*. The acorns of these last are eaten only when they can procure no others. There is one other very small species called *cheepis*, found growing in the mountains; but I cannot determine from their descriptions whether it is the chinquapin or the whortleberry oak.

The nut-pine or silver pine is *toan, toanem cha*. It is a great favorite with them, the most useful tree they have, and they always regret to see an American cutting one down. The nuts are a choice article of food; and, burned and beaten to powder, or crushed up raw and spread on in a plaster, they form their specific for a burn or a scald. The pitch and the mistletoe which grows on this pine are very valuable, in their estimation, for coughs, colds and rheumatism. They set them afire, making a dense smudge, and then the patient, wrapped in a blanket, squats over it or stands on all-fours over it, and works and shuffles his blanket, so as to make the smoke circulate all through it, and come in contact with every portion of his body. When an Indian has an arrow-wound, or wound or sore of any kind, he smears it with the pitch of this tree, and renews it when it wears off. In the spring, if food is scarce, they eat the buds on the ends of the limbs, the inner bark, and the core of the cone (*tach*), which is something like a cabbage-stalk when green. The coue-core and bunch-grass are boiled together for a hair dye. They are as proud of their black hair as the Chinese; and when an old chief who is somewhat vain of his personal appearance, or one of the dandies of the tribe, finds his hair growing gray, he has his squaw boil up a decoction of this kind, and he sops his bleaching locks in it. The tar *shindac*, which is worn by widows in mourning, is made of hot pitch and burned acorns, powdered; it is removed by means of soap-root and hot water.

(In adding the word for "tree" or "bush," they generally suffix the syllable *em*, thus *toan, toanem cha; paddit, padditem doo*).

Chippa is the willow, the long twigs of which are used both for arrows and basket-making. In making an arrow, the hunter employs a rude kind of turning-lathe, a couple of sticks held in the hand, between which the twig intended for the arrow is tightly clamped and twisted around, which rubs off the bark and the allurnum, and makes it round. The long straight shoots of the buckeye, *poaloh, poalem doo* are used for the same purpose. For the woof in basket making, they employ the wood of the redbud (*Cercis occidentalis-paddit*), which is split up with flints or the finger-nails into five strings, used substantially as thread. The willow twig is passed round and round the basket, the butt of one lapping the tip of the other, while the redbud strings are sewn over the upper and under the lower.

Cotoh is the manzanita. Its berries are a favorite article of food, and are eaten raw, or pounded into flour in a basket, the seeds separated out, and the flour made into mush, or sacked and laid away for winter. They also make quite an agreeable article of cider from them, by soaking the flour in water several hours, and then draining it off.

Alder is *Shootoom*; poison oak is *cheetoc*. They are less easily poisoned by the latter than Americans; their children handle it a great deal while little. They eat the leaves both as a preventive, and as a cure for its effects; though it sometimes poisons them internally. The women use the leaves freely in cooking; they lay them over a pile of roots or a batch of acorn bread, then lay on hot stones and earth. The bright red berries of the California holly (*Photinea arbutifolia—yoarus*) are eaten with relish; also the berries of the elder, *nock*, and wild grapes—*peemen*. They call a grapevine a bush, *Speemenem doo*.

Soaproot, *howh*, is used for poisoning fish. They pound up the root fine, and mix it into pools where the fish and minnows have no way of escape, and as the same time stir up the bottom until the water becomes muddy. The minnows thrust their heads out of the water stupefied, and are easily scooped up. Buckeyes are used in the same manner. Soaproot is also used to heal and cleanse old sores, being heated and laid on hot. Both soaproot and buckeyes are eaten in times of great scarcity; they are roasted underground thirty-six hours or more, to extract the poison.

For toothache the remedy is the root of the California buckthorn, (*Frangula Californica—luhum doo*). It is heated as hot as can be borne, placed in the mouth against the offending member, and tightly gripped between the teeth. Several sorts of mints, *keesuh*, are used in a tea or decoction for colds or coughs. Ague is believed to be cured by a decoction of the little mullin, (*Eremocarpus setigerus—badah*) which grows on black adobe land in autumn. Colic is treated with a tea made from a greenish-gray lichen, (*Parmelia soxicola—wahattac*), found growing on stones. For rheumatism they take the leaves and stems of a parasite vine (*Galium—sheshem*), which grows up in the middle of the chaparral bush, heat or burn them, and clap them hot on the place.

Yellow dock, *heet*, is a valuable specific in their pharmacopœia. In case of acute pain of any description the root is heated hot and pressed upon the spot. In the spring the leaf is eaten boiled, for greens, together with clover and many other things.

Bunch-grass, *boopuh*, is the subject of superstition. They believe that the long, slender stalks of it, discharged as arrows from a little bow against a pregnant woman, will produce a miscarriage; also, that they will hasten the time of maturity in a maiden. There is another thing which they call *wocoamah*, probably wild parsnip, which they believe to be a deadly poison. It will produce nose-bleed, and the people who keep it in their houses will surely die. I will here state that I can not discover that the Indians ever used poisons to any considerable extent to rid themselves of enemies; if they did, it was the old medicine-men, and they keep the matter a secret. The Indians profess to stand in great and perpetual dread of being poisoned by one another; and no one will taste anything handed to him by one who is not a member of his family, unless the other tastes it first; but they imagine a hundred cases of poisoning where one actually occurs.

Of grasses, they eat the seed of the wild oat, (*tootootem com*), but very sparingly. Wild clover, *cheewee*; alfilerilla, *ballis*; and a kind of grass growing in wet places (*Melica—holl*) are all eaten raw when young and tender, or boiled for greens.

There are two kinds of mushrooms which they consider edible. The one of which they are fondest is called *poolcut*, and is a little round ball, from the size of a marble to that of a bleck walnut, found under-ground in chaparel and pine thickets. They eat it raw with great relish, or roast it on the ashes. Another kind is the *wachuh*, which grows in the ordinary form, brown on the upper side, chocolate-colored and deeply ribbed underneath, and easily peeled. It is eaten boiled.

Higher up in the mountains they find a root looking somewhat like cork, a piece of which they sometimes wear suspended to their clothing as a charm. It is called *chook* or *champoo*. Indians of other tribes in the State invest different species of *Angelica* with talismanic attributes.

Under the popular name of grass-nut there

[Continued on Page 236.]

Boat Building.

The handsome ladies' bsrge exhibited at ths late Mecbanics' Fair by the Cslifornia Theater Boat Club, has attracted considerable sttention from even those with no inclination for aquatic pleasures. They see thst she is beautifnlly fitted up with tasty awnings, cushions, oarpets, etc., and that she is totally different from tbeir preconceived ideas of boats. Msny people tbink tbat a boat is a concern which flosts snd imperfectly keeps ont the water, where the psssengers set on dsmp seats with their feet in puddles, in a perpetual state of anxiety as to whether they will ever gst ashore again. The appearsnce of the boat in qnestion unsettles this tbeory, as she reslly looks neat and comfortable, as well as perfectly safe. There is one thing in connection with her, bowever, tbat has not been explainsd. It is supposed by many that she was built by the California Theater Boat Club, which she was not. She does not even beloug to the club, but to an individusl member. The club owns and uses boats, but does not build them; althongh in ons instance some of the members did build a boat, but that was a four-oared shell, entirely different in size and shape and appssrance from the one latsly on exhibition.

In a Fair hsld under the anspices of a Mechanic's Institute, the artizans and manufacturers ought to have full credit for what they have done; mnch more credit, in fact, tban those who simply exhibit srticles made by other persons. This is not always given, however. We do not thiuk it wonld be a bad idea at exhibitions of this sort to give the usmes of the workmen who construct a bsautiful piece of machinery or anything else, as well as tbe names of the persons for whom it was made. This is not a commou custom, but it ought to be, as it wonld encourage individual artisans and make their names known outside of "shop" ciroles.

Well, perhaps the reader is anxious by this time to know who did build that boat, aud thinks it sbout time we told him if we know. In answer to tbis mental query, we say, Mr. Wm. Stone, a first-rate boat builder, but so modest withal thst he didn't put his nsme on the boat as its builder. Bill Stone, as he is called in yachting and boating circles, is one of the leading boat builders of the town. He bas a fine boat yard, houss, etc., in front of bis residence on the Potrero, where he has facilities for hauling out of water any of the yachts, or large craft which ueed repair. He built the yacht "Peerless" for Capt. Ogden, and afterward reconstructed her, turning her into a eteamer, and after that turned ber into a schooner agaiu. He has built several other good sized vessels and smsll boats innnmerable. He is specially patronized by the members of the S. F. Yaoht Club, with whom his bosts receive a well deserved reputatiou. Tbere are a grest number of his boats in the boat houses and steps in tbe sonthern part of the city, where he is well known among the boatmen and gentlemen who are fond of sport on the water. The boat in tbe Fair is a good sample of his work, and he is capable of turning out anything, from a duck-punt to a first-class yacht, both of which he has done. His boats are remarkable for their strength and fine and elegant finish, as well as for the beauty of model.

A Success.—It is a matter of congratulation, not ouly to Harry Strout, the manager of the Hoosac works, but to all interested in the welfare of our mining district, tbat the experiment made by him in erecting a matting furnace at his smelting works is a success—one beyond his moat sauguinary expectations. Yesterday morning, at 9 o'clock, ore was tbrown in, and for two hours, anxiously expectant of the result, the manager watched the workings of the furnace, until at length be had the satisfactiou of seeing a perfect separation from tbe rich quartz ores which contained too much lead to be properly reduced by the smeltiug furuace. By the matting furnaoe all classes of ore can be advantageously worked; that from Silverado, Secret cañon and Newark, can all be reduced to a flux which hitherto was almost impossible to procure, and a perfect separation of all siliciferoue eubstancee. By the mattiug process 20 tons of ore can be treated each 24 hours, so elated is Mr. Strout over the success attendiug his first effort that he will have another, similar in desigu, erected immediately.—*Eureka Sentinel.*

Technical Schools.—Where onr future skilled workmen are to come from is a question wbich is crowding for a solution. The decline, or rather the total abrogation of the apprentice systsm has deprived the youth of the opportunity of learniug trades. The result is that there are few who are learning, so that skilled labor is getting scarcer in every department of industry. It is therefore a matter of urgent importance that some method ebould be devised to remedy this difficulty. Of all the plans discussed there seems to be but one which promises success; that is, the establishment of technical schools. The large degree of success which has followed the introduction of these schools in some departments of our activities is strong proof of their utility in all branches. We might refer to our various schools of design and art, to our medical schools, and schools of mining and engineering.

The Big Tailings Flume.

Tbe Big Tailings flume on Carson river, uear the Woodwortb mill, is now in successful operation. It is 1,700 feet in length and 19 feet in width. It contains over 150,000 feet of lumber, and it is claimed that it is tbe largest flume of tbe kind in the world. It doubtless is all tbat is claimed, as there are but few places in the world where snch flumes are in use. It is divided into 12 compsrtments, each 19 inches in width. The bottom of each of these compartmeuts is covered with blsnkets of a particular kind, manufsctured expressly for this use. It is among the tbreads and in the wool staple of these strips of blanketing that the silver sulphurets are caught. In tbe majority of the flumes of this kiud now in nse in the country, it is a good deal of tronble to secnre the sulphnrets after they are caught in tbe blankets. The old plan of doing this was to turn the water out of tbe compsrtments, tske up the strips of blanketing, and losding them upon a wheelbarrow or car, take them to a tank aud wash tbem ont, wben the precions sulpburets would fsll to tbe bottom and so be saved. With the new flume this business is msnaged much more expeditiously. A deep and narrow sluice runs by the side of the flume, and into this the flume is washed by sections of 150 feet. The blankets are washed where they lie in the compartments, and the sulphurets obtained are tben run ont into the side sluice, which carries them to where they are to be dumped. In this way the work of wasbing the blankets is cheaply and spbedily accomplished. All the tailings flowing down Gold cañon pass over this flume. A dam across tbe cañon turns the tailings into a large string of sluices, which carries them scross the conntry to the flume, situsted about two miles above Dayton. Tbe blsnkets catch a considerable per cent. of the valuable materisl contained in the tailings, but no matter how many sluices tbey psss through, tbey still contsin much gold and silver. In this way millions on millions of dollars have found their way into the Carson river aud thence into the sink or lake into which it empties. Not only are gold and silver thus lost in the river, but also tons on tons of quicksilver. All the quicksilver brought to the country is eventually lost, eithsr in the water or in tbe sir, for none is ever carried out of the State.—*Virginia Enterprise.*

New Pump.—The *Desert News* has been exsmining a new double-action plunger pump, invented and completed by W. J. Silver, Salt Lake City. The *News* says: The oastings for this steam-pump were prodnced, some of them (the hesviest) at tbe rsilroad shops, some at Davis & Sons', and some at the Salt Lake Iron Works, that used to be. All the turning, boring and fitting were done at Mr. Silver's machine shops, and that gentleman fitted up a steam boring machine expressly for this work, which operates with astonishing rapidity. The steam cylinder of the pump has a 16-inch bore, the plunger is 10 inches in diameter, and has a 24-inch stroke. At a moderate rate of speed the pump will throw out 450 gallons of water a minute, but the capacity cau be incressed, when required, to from 600 to 700 gallons a minute. Tbe great advantage of this pump over others, and which constitutes the improvement on which the letters patent were granted, is that it can operate with as great facility in one position as another, at any angle, which is an incalculable advantage for pnmping mines, saving a large amount of expense in excavating to attain positions necessary with pumps which do not bave this improvement. Tbe cost of this piece of machinery is, we are informed, about one-fifth what it would have taken to put a Cornish macbine of similar capacity at tbe Emma, for the use of which mine it is designed, and to the locality of which it will be taken on Friday.

Working Coal in Depth.—The *Ironmonger* says: It bas been stated that it is not likely coal can be worked below 4,000 feet in depth; but in the neighborhood of Cbarleroi, in Belgium, coal is worked without any difficulty at nearly 4,000 feet. In reference to the hindrance expected to arise from increase of heat, Mr. Hunt states tbat bis measurements of temperature have tended to sbow that the rate of increase diminishes; down to 100 fatboms from the surface he has found the increase one degree in 50 feet, but in the next 100 fathoms only one degree in 70 feet, and in the tbird 100 one degree in 85 feet. Even supposing the heat to be as great as some people imagine, he believes that tbat very heat will be found to be an engineering agent which will help in the process of ventilation, so as to produce a temperatnre sufficiently low to enable men to work tbere with no great difficulty.

Kentuck Hoisting Works.—The old Kentuck hoisting works building was torn down some two months ago. Tbe sngines and boilers constitute about tbe only machinery left on the premises. The Crown Point Raviue Company, who have secnred the use of the Kentuck sbaft for the purpose of prospecting their own mine, will have to make some extensive repairs npon the works before the machinery can be used for hoisting.

Winter Supplies.—The Consolidated Virginia mining company are at present laying in an immense supply of lumber and mining timbers for the coming winter at their yard, near the depot. The timbers are from 12 to 16 inches sqnare, and are all hewed. They were floated down the Careon river this summer from the Sierra Nevada mountains to Empire City, and from there were brought to this city by the Virginia and Truckee railroad.

The Progress of the New Mill.—The new mill of the Consolidated Virginia Company is beginning to loom up grsndly. Tbe wing in which will be situated the batteries and tbe macbinery therewith connected is fast drawing to completion. It is inclosed and roofed. The wing running eastward, which will contain the pans, settlers and other apparatus counected with the amalgamating department, is also up and is now being roofed. The vsst dimensions of these buildings sre not st once apparent to the casual observer, as they are not of great hight, but when ons descends to the level on which the structures stsnd they spread away to a great distauce in all directions. Tbe new mill will be connected with tbe company's hoisting works by a railway; the works and the mill being but a sbort distance apsrt. The ores from ths mine will be rnn directly to the mill in cars, and will be dumped in the bsttery-room just wbere tbey are wanted. Around the mill are half a dozen large sheds, under which are engaged workmen of all kiuds. In one of these temporary sheds is a steam engine, driving planes and all kinds of labor-saving machiuery. The mschinery running in this shed would constitute a first-class planing mill and shop in some towns.—*Virginia Enterprise, Sept.* 30.

The Mining and Scientific Press--Ever Onward.

Our careful system of compiling, judiciously condensing, and conveniently arranging into regular departments, has been heartily endorsed. It renders the paper worth more to readers, who can find handily that which interests them most.

The weekly issues of the Press will contain reliable

Information for Practical Miners,

Treating on the Opening of Mines; Mining of Ores; Milling of Ores; Smelting of Ores; Separation and Roasting of Ores; Amalgamation; Saving of Gold and all precious Metals; New Processes of Metallurgy; New Discoveries of Mines; Mining Engineering and Hydraulics.

For Inventors, Mechanics and Manufacturers.

All new and important developments in Scientific and Mechanical Progress; Patents and Inventions of the Pacific States; Progress of Home Industries; Hints for Local Manufacturers; Illustrations of New Machinery; Reports of Popular Scientific and Industrial Lectures.

Our Mining Summary

Gives the progress of mining work from week to week in the various counties and districts throughout the principal mining regions of the United States, arranged in alphabetical order. It is the most extensive record of mining operations published in the world. It affords the intelligent miner a rare opportunity to know and profit by the work and experience of his neighbors. Miners have few sources of practical information in their calling, and should embrace every reliable means for improvement. Mining Operators and Shareholders, at home and abroad, weekly examine our Summary with increased interest and profit.

Our "Domestic Economy"

Embraces new and important facts which should be known in every cabin and household. Short and interesting—the articles under this heading are freely read and practiced with profit and improvement to the readers.

The Press is not strictly a "paper for professional scientific men," but rather a

Liberal and Popular Scientific Journal,

Well calculated to make practically scientific men from our intelligent masses. This is our stronghold for accomplishing good. Plain, correct and pleasing language, easily comprehended by all, confined mostly to short articles, is our endeavor.

For Self-Improvement,

Every issue of the Press abounds with articles of an elevating character, to stimulate the higher virtues and natures and progressive intellects of both men and women.

Hundreds of Dollars

Are oftentimes saved to the readers of this paper by a single hint or article of information in its columns; Such instances have been repeatedly reported to the editors and proprietors during their long connection with the Press. Our paper presents

The New and Novel Developments

In the progress of this comparatively new section of the Union (but recently settled and now rapidly increasing with a population of the most intelligent and venturesome people, attracted from nearly every quarter and clime on the globe), enable us, with due enterprise, to display vigor and freshness in our columns not met with in similar journals elsewhere. The same circumstances also render such a paper more especially valuable to its readers in a new, and, to a certain measure, untried field, where the best methods and processes of industry are not so well established or traditionally known as in older communities. Published experiences often save costly experiments and disastrous results.

A Great Variety of Industrial Information,

In brief and fresh form, suited to the wants and tastes of the readers of this coast, which is not obtainable otherwise so timely, or in so cheap and convenient form. As an industrial publication, meeting the wants of so many kindred industries, this journal stands pre-eminent and without a precedent.

Subscriptions payable in advance—$4 per annum Single copies, post paid, 10 cents. Address

The Mining and Scientific Press, San Francisco, Cal., Dewey & Co., is a rich *placer*, wherein golden information may be found, valuable to any searcher after knowledge.—*Newark Manufacturer.*

DEWEY & CO.

American & Foreign Patent Agents,

OFFICE, 224 SANSOME STREET, S. F.

PATENTS obtained promptly; Caveats filed expeditiously; Patent reissues taken out; Assignments made and recorded in legal form; Copies of Patents and Assignments procured; Examinations of Patents made here and at Washington; Examinations made of Assignments recorded in Washington; Examinations ordered and reported by Telegraph; Rejected cases taken up and Patents obtained; Interferences Prosecuted; Opinions rendered regarding the validity of Patents and Assignments; every legitimate branch of Patent Agency Business promptly and thoroughly conducted.

Our intimate knowledge of the various inventions of this coast, and long practice in patent business, enable us to abundantly satisfy our patrons; and our success and business are constantly increasing.

The shrewdest and most experienced Inventors are found among our most steadfast friends and patrons, who fully appreciate our advantages in bringing valuable inventions to the notice of the public through the columns of our widely circulated, first-class journals—thereby facilitating their introduction, sale and popularity.

Foreign Patents.

In addition to American Patents, we secures with the assistance of co-operative agents, claims in all foreign countries which grant Patents, including Great Britain, France, Belgium, Prussia, Austria, Victoria, Peru, Russia, Spain, British India, Saxony, British Columbia, Canada, Norway, Sweden, Mexico, Victoria, Brazil, Bavaria, Holland, Denmark, Italy, Portugal, Cuba, Roman States, Wurtemberg, New Zealand, New South Wales, Queensland, Tasmania, Brazil, New Grenada, Chile, Argentine Republic, AND EVERY COUNTRY IN THE WORLD where Patents are obtainable.

No models are required in European countries, but the drawings and specifications should be prepared with thoroughness, by able persons who are familiar with the requirements and changes of foreign patent laws—agents who are reliable and permanently established.

Our schedule prices for obtaining foreign patents, in all cases, will always be as low, and in some instances lower, than those of any other responsible agency.

We *can and do* get foreign patents for inventors in the Pacific States from two to six months (according to the location of the country, sooner than any other agents.

Home Counsel.

Our long experience in obtaining patents for Inventors on this Coast has familiarized us with the character of most of the inventions already patented; hence we are frequently able to save our patrons the cost of a fruitless application by pointing them to the same thing already covered by a patent. We are always free to advise applicants of any knowledge we have of previous applications which will interfere with their obtaining a patent.

We invite the acquaintance of all parties connected with inventions and patent right business, believing that the mutual conference of legitimate business and professional men is mutual gain. Parties in doubt in regard to their rights as assignees of patents, or purchasers of patented articles, can often receive advice of importance to them from a short call at our office.

Remittances of money, made by individual inventors to the Government, sometimes miscarry, and it has repeatedly happened that applicants have not only lost their money, but their inventions also, from this cause and consequent delay. We hold ourselves responsible for all fees entrusted to our agency.

The principal portion of the patent business of this coast has been done, and is still being done, through our agency. We are familiar with, and have full records, of all former cases, and can more directly judge of the value and patentability of inventions discovered here than any other agents.

Situated so remote from the seat of government, delays are even more dangerous to the inventors of the Pacific Coast than to applicants in the Eastern States. Valuable patents may be lost by the extra time consumed in transmitting specifications from Eastern agencies back to this coast for the signature of the inventor.

Confidential.

We take great pains to preserve secrecy in all confidential matters, and applicants for patents can rest assured that their communications and business transactions will be held strictly confidential by us. Circulars free.

Engravings.

We have superior artists in our own office, and all facilities for producing fine and satisfactory illustrations of inventions and machinery, for newspaper, book, circular and other printed illustrations, and are always ready to assist patrons in bringing their valuable discoveries into practical and profitable use.

TO MILLMEN AND MINERS.

ASSIGNEES' SALE IN BANKRUPTCY.

NOTICE IS HEREBY GIVEN THAT THE UNDERsigned, under and by virtue of the power and authority vested in them, and by virtue of an order of the District Court of the United States for the District of California, made and entered on the 16th day of September, A. D. 1874, in the matter of the MENDHA SILVER MINING COMPANY, Bankrupt, will sell at public auction, in the city and county of San Francisco, at the auction salesroom of John Middleton & Son, No. 310 Montgomery street, on

Friday, the 23d day of October, A. D. 1874
At 12 o'clock, M.,

All that certain mining and mill property and premises situate in Highland Mining District, near Pioche, State of Nevada, described as follows, to-wit:

One twenty-stamp mill and machinery, together with the appertenances belonging to the same and necessary for the proper working thereof;

Also, the mill sits and the spring known as Mendha Spring, and the tract of land enrrounding the same to the extent of twenty (20) acres;

Also, all the water-pipe connecting tha springe with said mill;

Alse, the buildings, office, stable, hoarding-house, etc., upon said land and adjacent to said mill;

Also, the "Stetefeldt" furnace in said mill;

Also, the following named mines, to-wit:

Mendha Mine;
Mendha West Extension Mine;
Regent Mine;
Arizona No. 2 Mine;
Chief Mine;
Crown Prince Mine;
Sadowa Mine;
Alaske Mine, and
Mendha East Extension Mine;

Also, the hoisting works, machinery and all other appurtenances connected with said mines, mill and premises.

Said property is known as the Mendha Mill and Mines.

Terms of Sale—Cash in U. S. gold coin; ten per cent. on fall of hammer, balance on confirmation by U. S. District Court.

For particulars respecting this property apply to the undersigned, at their respective places of business, and to J. M. SEIBERT, Agent at Wells, Fargo & Co., at Pioche, Nevada.

Dated San Francisco, September 17, 1874.

WILLIAM A. SCOTT, JR.,

Ayer's Hair Vigor
—FOR—
RESTORING GRAY HAIR
TO ITS NATURAL VITALITY AND COLOR.

Advancing years, sickness, care, disappointment, and hereditary predisposition, all turn the hair gray, and either of them incline it to shed prematurely.

AYER'S HAIR VIGOR, by long and extensive use, has proven that it stops the falling of the hair immediately, often renews the growth, and always surely restores its color, when faded or gray. It stimulates the nutritive organs to healthy activity, and preserves both the hair and its beauty. Thus brashy, weak or sickly hair becomes glossy, pliable and strengthened; lost hair regrows with lively expression; falling hair is checked and stablished; thin hair thickens; and faded or gray hair resume their original color. Its operation is sure and harmless. It cures dandruff, heals all humors, and keeps the scalp cool, clean and soft—under which conditions, diseases of the scalp are impossible.

As a dressing for ladies' hair, the VIGOR is praised for its grateful and agreeable perfume, and valued for the soft luster and richness of tone it imparts.

PURCHASERS please say advertised in Scientific Press.

[Continued from Page 233.]

is included a lsrge number of plants with a small, rondd, bulbous root, sll of which, with one exception, the Indians est with much satisfsction. They are generally pried out of the ground with a sharp stick and eaten raw on the spot; but sometimes the women collect a quantity in a hasket and mske a roast in the ashes, or hoil them. Most of them are hy no msans disagreeable to the civilized taste. There is the beavsr-tail grass-nut (*Cyclobothra-wallic*), the turkey-pea (*Sanicula tuberosa—tuen*). the purple-flowered grass-nut (*Brodiœa congesta—oakow*); the tule grass-nut (*coak*), a small hulb, with a siugle, wiry, cylindrical stalk, growing in wet places, which I could not identify; the climbing grsss-nut (*Brodiœa volubilis—oampoom wi*), sometimes planted by Americans for ornaments; the littlo sosproot (*Chlorogalum divoricatum—poyum*); the wild garlic (*Allium—cooceh*); the eight-leafed garlic (*shal*), the five-leafed garlic (*inshal*), snd the three-leafed garlic (*woolcwe*); the yellow-hlossom grass-nut (*Calliproa lutea—ustuh*); the long-leafed grass-nut (*Brodiœa congesta*, although the Indians have a different name for it from that mentioned just above, namely, *yoang wi*); the white-flowered grass-nut (*Hesperoscordium lacteum—yowak wi*); and the wild onion (*Allium cepa—chan*). There is one other grass-nut, with a black hulh (*Anticlea—haccul*), which the Indians consider poison, although it probahly contains no more poison thsn other members of the liliaceous family.

The list of greens which thoy eat in the spring is also quite extensive. Besides the grssses and the yellow dock ahove mentioned, there is ths mask-flower (*Mimulus luteus—poosham*); two species of the *Angelica* (*hen* and *oamshu*), which are difficult to determine; the California poppy (*Escheholtzia Californica—tapoo*), either hoiled or roasted with hot stones, and then laid in water; the rock-lettuce (*Echeveris lanceoluta—pettitac*), eaten raw; the wild lettuce (*Claytonia perfoliati—yau*), and a species of *Sanicula* (*mancoo*), the root of which, long and slightly tuherose, is also eaten. Of the wild lettuce a curious fact is to he noted. The Indisns living in the mountains, about at the elevation of Anhurn, gather it and lay it in quantities nesr the nests of certsin large red ants, which have the hahit of huilding conical heaps over their holes. After the ants have circulated all through it, they tske it np, shake them off, and eat it with relish. They say the ants, in running over it, impart a sour taste to it, and make it as good as if it had vinegar on it. I never witnessed this done, hnt I have heen told of it, at different times, hy different Indians whom I have never known to deceive me.

Of seeds, they eat the following: A kind of cosrse, wild grass (*Bromus virens—dodoh*) a species of yellow-hlooming, tarry-smelling weed (*Madaria—coamduc*), the sёeds of which are as rich as hntter; the yellow-blossom or crow-foot (*Ranunculus Californicus—tiss*) of which the seed is gathered hy sweeping through it a long-hsndled hasket or s gourd; a little weed which grows thick in ravines (*Blennosperma Californicum—poll,*) gathered the same way; also a weed (*sheeoo*) with little white hlossoms distrihuted all along the stalks, which are thickly covered with minute prickles —I know not what it is. All these seeds are generally parched a little, and then heaten to flour, and eaten without further cooking, or made inlo hread or mush. The dry, parched flour of the crowfoot seed has that peculiar, rich taste of parched corn.

There is nn umhelliferous plant (*shokum*), the root of which the Indians esteem very highly for food; more highly than any other, it being their nearest equivalent to potatoes. I know not if it is the true cammas; I think it is at least a species of it. It grows on rocky hill-sides, hlossoms in June and July, has an extremely delicate, fringe-like leaf, and a root about an inch long and a quarter as thick, sweetish-pungent and agreeable to the tsste. In Penn valley, Nevada county, they gather large quantities of it.

They are acquainted with the *Yerba santa*, but attsch no particular value to it.

Around old csmps snd corrals there is found a wild tobacco (*Nicotiana plumbaginifolia—pan*), which they smoke with great satisfaction. They gather the leaves and dry them in the snn in a rnde fashion, then cut them up fine. It has a puugent, peppery taste in the pipe, hut is better thau nine-tenths of the Chinese-msde cigars. It is smoked iu a wooden or stone pipe, which is constructed of a single straight piece, the bowl being simply a continuation of the stem, enlarged. I saw one made of soapstone, about six inches long, five inches of it heing the bowl, which was nearly an inch wide at the extremity, so thst it wonld hold enough to last half an hour. It was quite a handsome piece of workmsnsbip, perfectly round and smooth, tspering evenly down to a bulh, which was inserted in the mouth. The tohscco pipe is called *panemcoolah*.

There are two plants used for textile purposes. One is a kind of tule-grass or small bulrush (*uncas doccun*), which they hetcheled with flints or with their finger nails, hleached and wove into breechcloths. For strings, cords and nets they uaed the inner hark of tbe lowland milkweed (*Asclipias—poo*). Wheu it is dry the Indian takes both enda of a stalk in his mouth and crushes it with hia teeth, or else passea it over a stone while he gently taps it with another; then atrips off the bark and twists it into strands, then into cords. The rock milkweed (*oampoo*) has a medicinal value; they nse the root for the toothache, the same way the root of the buckthorn is nsed.

It is necessary to state thst most of the medicines ahove mentioned are of the clsss which the women are allowed to become acquainted with and to employ it. There are several other suhstances which sre more rare snd valuahle, or at least they deem them more valuable, and which the medicine men alone know anything ahout. They are found far up in the mountains or in other locslities, and may be called the medicines of commerce, having a tolerably well-settled value in shell-money. I regret thnt I was generally unable to secnre sufficiently complete specimens to determine them. For instance, there is a rout, (*luhno,*) which I should call Seneca Snakeroot, hut of which I could procure only a little piece. A root ahont as large as a pipe-stem and ahout four inches long and is worth about $1. A decoction of it is used for diarrhea, that scourge of aboriginal life, also for venereal diseases. There is a hnsh (*chapun,*) found in the monntains, with a very pale tea-green hark, aud minute golden speeks on the small limhs, which is probably California sassafras, and which is very highly esteemed for coughs and colds, a tea of the bark being given. Another root, (*pallic,*) spignet from its appearance, is made into a tea and drank for diarrhea; this also is very valuahle. There is still another root, (*litway,*) found on the Truckee, which is good for the dropsy.

Although it is not strictly germain to the topic, I may be permitted to state that the Indians hsve names for all the internal organs of the human hody; and their idess of their functions and of the operations of medicine are at least as respectshle as the Chinese.

Cornell University and Ours.

A correspondent of the Santa Bsrhara *Press*, writing from Ithica, New York, after a hriet retrospect of Cornell University as it was six years ago, continues as follows: Then, but one huilding was oompleted, and another just rising to the diguity of a roof—now, eight massive piles of hrick, and stone, and mortar, rise to greet the eye of the returning pilgrim to his alma mster. Those were hsrd yeara for hoth college and collegian; those were years that mesnt work, and a "dig" was an honored man. There were 20 professors, all hard, earnest workers to be snre—now, 51 gather in the Friday council. Yet, students have not increased as fast as might have heen anticipated. Over 300 were here at the opening, and now the University mnsters but 500 on its roll.

Mr. Cornell, the grand old founder, is in very feehle health; gradually dying, it may be, from lung complaint. He has some thoughts of trying Southern California the coming winter, and I have heen urging him to do so; yet it is very douhtful whether he accepts my advice. I learn that his business affairs are very much involved by the recent psnic, and that they, too, are weighing down his weakened frame. For this reason, also, a winler's rest iu California might he useful and beneficial. It seems hard thst one who has resred to his nsme such a monument as those eight hnge hnildings now in sight, should die just before he hears the "God hless you" of the students they hsve turned out better fitted for the hattle of life. Mr. Cornell is a grsnd, good man, and has fonnded a University which, in seversl respects, surpasses sny on this oontinent; a fact, and I am making no idle statement. In engineering and in the mechanic arts, there is no institution to compare with Cornell in tnrning out practical men. And why? Because it has prsctical common seuse men, who teach in a practical common sense way. A machine shop is added to the lecture room, where the student applies the theory of the one to the practice of the other. It also turns out architects that nre already hscoming fsmiliar; and some of the most handsome and commodions buildings of the Alma mater are monumental to the men it has instructed.

While on Universities, let me say a word to your resders ahont the California University, its regents, and its president. I have no sympathy with the regents in some of their manoenvers; hut I have a word to say for President Gilman, of whom, here where he is well known, I hear the most flattering expressions. Talking to the President, while on this subject, a day or two ago, he spoke in the very highest terms of Mr. Gilman, saying that he had repeatedly offered and desired him to take the presideucy of Cornell; that he considered him one of the best scientists of the country, and that to him alone Sheffield scientific school owed its great success. Said he, "while certain parties have tried to create the impression that we differ widely in our educational views, we are prohahly more nearly together than any two other men in the conntry."

"But," said I, "howahout depriving the University of its Agricultural Chair, and providing six non-resident lecturers?" "Yon hsd better wait," he replied, "and see the six he selects. One I know to be the very hest man in the chemistry of soils in the country. Then, too, it is probahle that the Agricultural Chair will be immediately refilled, and these six lecturers be added to the force of instructors."

In view of these facts and considerstions, I would request the members of Santa Barbara Grange to go slow in their denunciationa and resolutiona. The hopes of a great University are pinned to no one man's coat-tail.

In Yavapai county, Arizona, there nre five quartz milla, there are also five water power and eight horse-power arastraa. The average yield of quartz per ton for the past year as computed hy the county clerk waa $117 per ton. Smith's quartz mill crushed ore lsst year which yielded $150,000.

The Gold Hill Tragedy.

A little sfter six o'clook on the evening of Octoher 3d, one of those wretched mining affrays which periodiosily disgrace our coast, occnrred at the Waller Defeat shaft of the Justice mine, in Gold cañon, hetween Lower Gold Hill and the Devil's Gate. Five men were killed. The murderous fight grew out of the contentions of two factions, each striving for the possession of the mine.

There has, it seems, for some time past, heen trouhle among the trustees of the Justice mining company, and dnriug the day of the 3d the side represented by Mr. Minear, President of the company, appointed one C. F. Kellogg, Superintendent in place of one T. F. Smith, who hss held the position of superintendent for some months past. It is ssid that the opposing members of the Board of Trustees instructed Smith to hold the works at any hazard. How well he obeyed orders, the bloody result shows. A party of 12 or 14 men, headed hy W. P. Kellogg, brother of the newly appointed Superintendent, approached the works to take possession, and the fight hegan. Having the advantage of position, the Smith faction made short work of their opponents, killing two instantly and wounding three others so hadly thst they died hefore morning. Kellogg was shot while advancing to parley. The nnmes of the killed are given as follows: Wm. P. Kellogg, aged 42 years; Michael Cain, aged 40 years; John Brown, aged about 40 years; Michsel Reiley, nged 38 years, and W. D. Shiflet, aged 45 years.

From evidence taken at the Coroner's inquest it has heen learned that the men with Kellogg were armed, ss he was determined to take and hold possession of the mine.

It was known that the Smith factiou had a force of men ahont the works, both at the Waller Defeat shaft and at the old Justice shaft, who were to keep possession of the works until they received instrnctions from Superintendent Smith, then in Virginia, to turn them over. It appears to have heen Kellogg's idea to have a talk with John Dunn, foreman of the Justics mine, and those with him, in order to find out what they were disposed to do. He had the men with him in order to hold the works if they were given up to him. A talk was had with Mr. Dunn, when he said he was ready to tnrn the works over whenever Kellogg should oome with the proper authority; that there would he no trouhle ahout it, etc. It was then thought that there would be no trouhle, snd and Constahle Harkin and Mr. Kellogg started toward Gold Hill, After they had gone some distance Kellogg saw his men going down towsrd the Waller Defeat shaft. Ahout this time six men left the old Justice works, and also made their way toward the Waller shaft. Mr. Kellogg now feared, his men not understanding what had passed hetween himself and Mr. Dunn, that there might he trouhle; he therefore told Harkin that he would go back and prevent his men from going to the Waller shaft. When he reached his men they were close to the huilding over the works, and were still advancing. Kellogg got hefore his men and tried to stop their advance. The men in the building warned them not to advance, and while Mr. Kellogg was remonstrating with his men two of them pushsd psst him and advanced toward the building. One raised his revolver as he moved forwsrd, snd instsntly a volley wss fired from the huilding. Three men fell, so hadly wounded that they died shortly. A parley then ensued. Kellogg told them that he desired to talk with them, and said that this work must not go on; that he didn't come there to have a battle with those in possession, and asked if he might enter. They answered that he might if he came alone, hut said that if another attempted to follow they wonld fire on the whole party. Mr. Kellogg now sdvanced toward the building, had reached the door, and wss in the act of rsising his foot to step in, when he was fired upon hy those inside and fell at the door. Michael Cain ran up to bring Mr. Kellogg away, he being still slive, when he wss shot in the hresst and killed. During this time two or three sbots were fired by the Kellogg party at those in the hnilding, bnt with what effect is not known. After the killing of Cain there seems to have heen an entire cessstion of hostilities on hoth sides, and the outside parties were allowed to approach and carry off the dead.

The inquest at the time of our going to press was still in progress. The murderers are in jail at Virginia City. It is to be hoped that the disgraceful affair will he thoronghly sifted and the guilty parties pnnished.

Ore Prnduct.—The average daily yield of ore in the Comstock for the past week has been, according to the *Chronicle*, Belcher, 500 tons; Crown Point, 550 tons; Con. Virginia, 300 tons; Chollar, 100 tons; Sierra Nevada, 65 tons; Ophir, 60 tons; Hale & Norcross, 40 tons. The Buckeye is producing enough ore to keep the Hope mill constantly running. The Ramsdell mill will be started np on ore from the Leo mine to-day. Several other mines are yielding ore in less qnantities.

The machinery of Messrs. Cialer, Zinn & Co's qnartz mill, nt Broad Guage City, is heing placed in proper position, and every wheel, belt and stamp will be ready to work in ahont two weeks. The mill will contain 20 stamps, and the *Montanian* thinks it will be the best of its kind in the Territory. It was made iu Chicago.

General News Items.

The fifteenth wheat ship of the season is at south Vallejo, and snother one is daily expected.

Lieutenant-Colonel F. D. Grant, son of the President, will get married in a few weeks in Chicago.

The State Fair of Nevada is to open at Reno on the 21st instant, and continne for three days. The premiums nnd purses offered amount to $7,000.

Immigrants.—During the six months just passed 18,529 immigrants have srrived from the Esst, making an averse of 3,088 per month, or a little over 100 per day. These fignres include only those who came in immigrant cars.

The Pavilion is to he utilized for regimental parades. The First Regiment will be reviewed hy Major-General Thompson in the building, toward the close of the month, and in Novemher and Decsmher, the Second and Third regiments will parade.

If Joe Herling, the San Msteo murderer, has escaped from the Stockton Insane Asylum three times, and gone skirmishing ahont the conntry after amsn he wants to kill, somehody wants to know how often this thing is to be repeated.

A Healthy Locality.—It is stated that to detain a physician in Berryesss vallcy, the residents are oompelled to pay a fixed sslary, for cases of sickness are so very rare that the income from his practice would not suffice to snpport a doctor.

Enterprise.—The proprietor of the New York *Herald* proposes to pay one-fourth of ths expense reqnired to fit out a Polar expedition. The enterprise of Bennett is very commendshle; indeed, we may say fully up to the spirit of the sge.

A Very Proper Law.—After the year 1876, no person will he allowed to vote in the State of Missouri, who csnnot read and write. The provision is an excellent one, and one which should become a law in all the Ststes. As the Oakland *Transcript* says: "Universal suffrage without universal educstion will in time swsmp any nation adopting it.".

Looking up Again.—A good deal of the old-time energy is heing displayed at Mokelumne Hill by the sufferers from the late fire. Several snhstantial stone buildings are in process of erection, more than half the wooden buildings that were destroyed have been rebuilt, and the prospect is that by the time the rainy season sets in, all the unfortunstes will hs comfortshly provided for. Business in the town, it is reported, is nearly if not quite as hrisk as ever.

Railroad ann Ship.—In anticipation that the railroad between Salinss and Monterey will be completed in a few days, the *Herald*, puhlished in the latter town, learns that a ship is expected to arrive there immediately to load with grsin for Enrope. The *Herald* prediots that "next harvest Monterey will ship more grain to Europe than any other port on ths coast, outside of San Francisco, and thst shs will be the most popular watering place in the State.

Big Blast.—Eight hundred pounds of giant powder placed in 30 drilled holes in Rincon rock were discharged on Tussdsy lsst. This rock lays some eight or ten feet nnder wster, off Rincon hill in this city, and directly in ths way of navigation. The blast was a most satisfactory one. The water was thrown to s hight of 100 feet, and the commotion all aronnd was great; a number of fish were thrown to the snrface—one, it is said, weighing 200 pounds; the wharves in the neighborhood, and the Norwegian hark *Aristos* were shaken like twigs.

Troubles Among Settlers. — Information reaches us that there is a likelihood of trouhle arising hetween some of the oldsr settlers in the vicinity of Pleasant valley, in this conuty, and parties coming in from San Benito and Monterey counties with sheep and stock. Ths original settlers in the neighborhood mentioned were stock-raisers, and they fenced in large trscts of the pnhlic domain, which is unsurveyed for ranges for their cattle. Parties coming in from the counties mentioned, tear down the fences snd drive their sheep in and let the settlers' stock ont. In several instances, we are informed, weapons have heen drawn, snd wordy wars indulged in, bnt fortunately resulted in nothing worse, but fears are entertained that jndgment may not always prevail. —*Fresno Expositor, Sept. 30th.*

Yosemite Valley Awards.—It will he recollected that the last Legislature made an appropriation of $60,000 to pay the claims of settlers in Yosemite valley, and made the necessary srrangements for the appointing of commissioners to appraise the value of the property. These commissioners visited the valley, gave the subject the attention it deserved, and submitted their reports to the State Board of Examiners—majority and minority reports. The majority report was in favor of paying ss follows: To J. M. Hntchings, $24,000; A. G. Black, $22,000; J. C. Lamon, $11,000; Ira B. Folsom, $3,000. The minority report was: Hutchings, $35,000; Lamon, $12,000; Black, $10,000; Folsom, $3,000. The State Board of Examiners, after taking the testimony of the commissioners, and slso of the settlers, awarded to Hutchings; $24,000; Black, $16,000; Lamon, $12,000; and Folsom, $3,000; which leaves $5,000 of the appropriation to he returned to the general fund.—*Sac. Union, Oct. 1st.*

PATENTS & INVENTIONS.

A Weekly List of U. S. Patents Issued to Pacific Coast Inventors.

[FROM OFFICIAL REPORTS FOR THE MINING AND SCIENTIFIC PRESS, DEWEY & CO., PUBLISHERS AND U. S. AND FOREIGN PATENT AGENTS.]

By Special Dispatch, Dated Washington, D. C., Oct. 6th, 1874.

FOR WEEK ENDING SEPT. 22d, 1874.

AUGER.—Benjamin Forstner, Salem, Oregon.

BREECHING STAY FOR HARNESS. — Eugene Crongbwell, Augustus Tillman and E. L. Vaaderberg, S. F., Cal.

COMPOUND IMPLEMENT. — Linda H. McNair, Oakland, Cal.

REVOLVING HARROW.—Heury N. Daltou, Pacbco, Cal.

ELEVATOR.—Philip Hinkle, S. F., Cal.

DITCHING AND EMBANKING MACHINE.—Wm. B. Hyde, Oakland, Cal.

WATER-CLOSET AND CHAMBER-POT GUARD.—John F. Larrabee, S. F., Cal.

ORE CONCENTRATOR.—James M. Thompson, S. F., Cal.

REISSUE.

PROCESS OF MANUFACTURING ARTIFICIAL STONE. Ernest L. Ransomo, S. F., Cal.

DESIGN.

HANDLES FOR SPOONS AND FORKS.—Wm. K. Vanderslice and Lncius Thompson, S. F., Cal.

——*The patents are not ready for delivery by the Patent Office until some 14 days after the date of Issue.

NOTE.—Copies of U. S. and Foreign Patents furnished by DEWEY & Co., in the shortest time possible (by telegraph or otherwise) at the lowest rates. All patent business for Pacific coast inventers transacted with perfect secrirty and in the shortest time possible.

CARSON MINT.—The *Appeal* says: "The largest month's work ever done at the Carson mint was that of the past month of September. Following are the figures: In trade dollars, $209,000; in double eagles, $120,000; in eagles, $59,590; in half eagles, $34,250; total, $432,840. Taking into consideration the fact that they run bnt one press thie is a splendid showing. There are, we believe, eome eound reasone for hoping that the capacity of the institution will, before long, be largely iacreaeed, as needs to be."

THE air compreeeors for the Ophir mine have arrived. It ie expected the compreesors will be in active operation thie week. The weight of the machiuery, including the halance wheel, ie 15,050 pounde.

THERE are only a few vacant lots left on the "Divide" between Gold Hill and Virginia City, the connection between the two towne being nearly accomplished.

A Good Binder for $1.50.

Subscribers for this journal can obtain our Patent Elastic Newspaper File Holder and Binder for $1.50—containing gilt title of the paper on the cover. It preserves the papers completely and in such shape that they may be quickly fastened and retained in book form at the end of the volume, and the binder (which is very durable) used continuously for subsequent volumes. Post paid, 25 cts. extra. It can be used for Harper's Weekly and other papers of similar size. If not entirely pleased, purchasers may return them within 30 days. Just the thing for libraries and reading rooms, and all who wish to file the PRESS. lambp

THE NEW U. S. MINING LAWS.

The new Laws of 1872, governing the location and purchase of Placer and Quartz Mines and Agricultural Lands in Mining Districts of the U. S., printed in circular sheet, for sale at this office. Sample copies 25 cts

Mining and Other Companies.

Cincinnati Gold and Silver Mining Company.

Principal place of business, San Francisco, State of California. Location of works, Kelsey Mining District, El Dorado County, California.

Notice is hereby given that at a meeting of the Board of Directors, held on the 25th day of September, 1874, an assessment of two and one-half cents per share was levied upon the capital stock of the corporation, payable immediately in United States Gold and Silver coin, to the Secretary, at the office of the Company, No. 531 California street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the second day of November, 1874, will be delinquent, and advertised for sale at public auction, and unless payment is made before, will be sold on Tuesday the 24th day of November, 1873, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

WM. SMALL, Secretary.

Office—Room 1, No. 531 California street, San Francisco, Cal.

Confidence Mining Company---Location of

Principal place of business, San Francisco, Cal. Location of works, Tuolumne County, State of California.

Notice is hereby given, that at a meeting of the Board of Trustees, held on the nineteenth (19th) day of September, 1874, an assessment of thirty (30) cents per share was levied upon the capital stock of the corporation, payable immediately, in United States gold coin, to the Secretary, at the office of the company, 217 Sansome street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on Monday, the twenty-sixth (26th) day of October, A. D. 1874, will be delinquent, and advertised for sale at public auction, and unless payment is made before, will be sold on the sixteenth (16th) day of November, 1874, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

W. S. ANDERSON, Secretery.

Office—No. 217 Sansome street, San Francisco, Cal.

And in accordance with law, and an order of the Board of Directors, made on the 24th day of August, 1874, so many shares of each parcel of said stock as may be necessary, will be sold at public auction, at No. 212 Sansome street, San Francisco, on Tuesday, the 20th day of October, 1874, at 12 o'clock M., of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

A. B. CLASON, Secretary.

Office, 212 Sansome street, San Francisco, Cal.

Oceanic Quicksilver Mining Company—

Location of principal place of business, San Francisco, California. Location of works, San Simeon Mining District, San Luis Obispe County, California.

Notice is hereby given, that at a meeting of the Directors, held on the 12th day of September, 1874, an assesement (No. 1) of forty cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary, at the office of the company, 438 California street, upstairs, San Francisco, Cal.

Any stock upon which this assessment shall remain unpaid on the 19th day of October, 1874, will be delinquent, and advertised for sale at public auction, and unless payment is made before, will be sold on Tuesday, the 10th day of November, 1874, to pay the delinquent assesment, together with costs of advertising and expenses of sale.

F. F. CRONISE, Secretary.

Improved Cast and Forged
STEEL SHOES & DIES FOR QUARTZ MILLS.
[PATENTED MAY 26TH, 1874.]

To Superintendents of Quartz Mills and Mining Men Generally.

We guarantee these SHOES and DIES to do the work of four sets of iron and to be at least 10 per cent. cheaper. They are gradually coming into use in all of the principal mills on this coast.

Their advantages over iron are cheapness on first cost, increased crushing capacity, time saved in changing and in setting tappets, increased value of amalgam by absence of iron dust and chippings, and a saving of 75 per cent. in freight. They possess a similar superiority that steel rails do over iron rails. It takes 40 days to fill orders from the manufactory East. Price 20 cents per pound shipped at San Francisco. Terms liberal.
Address all orders, with dimensions, to
CAST STEEL SHOE & DIE CO.,
Room 1, Academy Building, San Francisco.

Machinery.

BALL'S
SWEEPING DREDGE,
A NEW AND VALUABLE
CALIFORNIA INVENTION,
Has been very lately well proven by performing a job of dredging at the mouth of San Antonio Creek, at Oakland, Cal.

There is but this one machine that has ever had these improvements employed. It is an old machine, formerly built for another device, and is unfavorably constructed for Ball's improvements; yet this first temporary experimental machine has filled a scow of eighty-five cubic yards in sixteen minutes in unfavorable digging. For durability, digging hard material and fast work, it has a reputation (supported by leading engineers) as having no equal.

Testimonials and references will be given on application to the inventor, who is the sole owner of patents (excepting having made an assignment of the one machine now belonging to the Central Pacific Railroad Company). Having resolved not to sell any rights unless upon a *basis* of actual work performed by a machine built by myself for the purpose of fairly establishing the worth of the invention, I therefore offer to sell machines or rights on the following plan, which is warranting the capacity of the machine by actual work:

I will enter into an agreement with any responsible party to build and sell a machine, scows and tender, all complete, and right to all my improvements in dredging machines throughout the Pacific Coast for $20,000, warranting the machine to dredge six cubic yards per minute (to fill a scow at that rate). $20,000 will but little more than pay the cost of building the machine, scows, etc., all complete; therefore I am proposing to ask *nothing* for my patents unless my machine dredges more than six cubic yards per minute. But it shall be further agreed that in case (at a fair trial to be made within a stated time) the machine shall fill a scow at the rate of more than six cubic yards per minute, then $10,000 shall be added to the price above stated for each and every such additional cubic yard thus dredged per minute, and for additional fractions of a cubic yard thus dredged in the same ratio the $10,000 is to be added to said price above stated.

I will sell any other Territorial or State rights (either United States or Foreign) upon the same plan and at a lower price proportionately than the rights for the Pacific Coast.

I will sell a single machine with scows and all complete, and right to use the same in a limited territory, for $20,000 on the same plan as above stated, but will add only $2,000 to each additional yard over the six cubic yards per minute. Each machine is not to employ more than two 10x20 inch engines.

Payments to be made in U. S. gold coin on delivery of machine, as may be indicated by agreement.

Address, JOHN A. BALL,
9v28-tf Oakland.

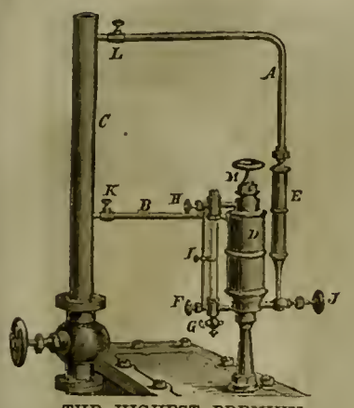
Repairing done on very Reasonable Terms and in the best manner. No. 82 Fremont street, S. F. 19v23-3m

N. Seibert's Eureka Lubricators.



THE HIGHEST PREMIUM

Awarded by the Mechanics' Institute Fair, San Francisco, and State Fair, Sacramento, 1871.

These Lubricators are acknowledged by all engineers to be superior to any they have ever used; feed constantly by pressure of condensed water, supplied by pipe A, regulated under the oil by valve J, and forced out through check valve and pipe B into the steam pipe C; it then becomes greasy steam, passes to all the valves and cylinder at every stroke of the engine; glass tube I indicates amount used per hour. Packing on rods and stems lasts longer, and the rings on the piston will not corrode. One pint of oil will last from three to six days, according to speed and size of engine; I, sliding gauge; K, valve to shut off when engine stopped; H, F, valves to shut off in case of frost; steam does not enter the cup; it is always cool; warranted to give satisfaction. Patented February 14, 1871. Manufactured by California Brass Works, 125 First street, S F. 24v23tf

Varney's Patent Amalgamator.

These Machines Stand Unrivaled.

For rapidity pulverizing and amalgamating ores, they have no equal. No effort has been, or will be spared to have them constructed in the most perfect manner and of the great number now in operation, not one has ever required repairs. The constant and increasing demand for them is sufficient evidence of their merits.

They are constructed so as to apply steam directly into the pulp, or with steam bottoms, as desired.

This Amalgamator Operates as Follows:

The pan being filled, the motion of the muller forces the pulp to the center, where it is drawn down through the apperture and between the grinding surfaces.—Thence it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, and to the circumference as before. Thus it is constantly passing a regular flow between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powder, and the metal amalgamated.

Setlers made on the same principle excel all others They bring the pulp so constantly and perfectly in contact with quicksilver, that the particles are rapidly and completely absorbed.

Mill-men are invited to examine these pans and setlers for themselves, at the office, 229 Fremont Street, San Francisco

Nevada Metallurgical Works,

Scientific and Practical Books on Mining, Metallurgy, Etc.

Published or issued, wholesale and Retail, by DEWEY CO., MINING AND SCIENTIFIC PRESS Office, S. F.

BY GUIDO KUSTEL,

MINING ENGINEER AND METALLURGIST.

Roasting of Gold and Silver Ores, and the Extraction of their Respective Metals without Quick silver. 1870.

This rare book on the treatment of gold and silver ores without quicksilver, is liberally illustrated and crammed full of facts. It gives short and concise descriptions of various processes and apparatus employed in this country and in Europe, and explains the why and wherefore.

It contains 142 pages, embracing illnstrations of furnaces, implements and working apparatus.

It is a work of great merit, by an author whose reputation is unsurpassed in his speciality.

Price $2.60 coin, or $3 currency, postage free

Concentration of Ores (of all kinds), including the Chlorination Process for Gold-bearing Sulphurets, Arseniurets, and Gold and Silver Ores generally, with 120 Lithographic Diagrams. 1867.

This work is unequaled by any other publisbed, embracing the subjects treated. Its authority is highly esteemed and regarded by its readers; containing, as it does, much essential information to the Miner, Mill man, Metallurgist, and other professional workers in ores and minerals, which cannot be found elsewhere in print. It also abounds throughout with facts and instructions rendered valuable by being clearly rendered together and in simple order. It contains 120 diagrams, illustrating machinery, etc., which alone are of the greatest value. PRICE REDUCED TO $5.

Nevada and California Processes of Silver and Gold Extraction, for general nse, and especially or the Mining Public of California and Nevada, with full explanations and directions for all metallurgical operations connected with silver and gold from a preliminary examination of the ore to the final casting of the ingot. Also, a descrlption of the general metallurgy of silver ores. 1864.

As its title indicates, this work gives a wide range of information, applicable to all vein miners and workers in precious metals, affording hints and assistance of exceeding value to both the moderately informed and the most expert operator.

Price, $6 in cloth; $6 in leather—coin.

BY OTHER AUTHORS.

The Quartz Operator's Hand-Book; by P. M. Randall. 1871. Revised and Enlarged Edition. Cloth bound, 176 pages. Price, $2.

Sulphurets: What They Are, How Concentrated, How Assayed, and How Worked; with a Chapter on the Blow-Pipe Assay of Minerals. By Wm. M. Barstow, M.D.; 1867; cloth bound, 114 pages. Printed and sold by DEWEY & Co. Price, $1; postage free. The best written work, and most complete work on the subject treated.

ANY OTHER BOOKS DESIRED will be furnished at the most reasonable rates by DEWEY & Co., Mining and Scientific Press Office, S. F.

A LIFE DOUBLY ASSURED.—A resident of Bangor, Maine, writing to C. N. Crittenton, 7 Sixth Avenue, for a supply of *Hale's Honey of Horchound and Tar*, mentions incidentally that three months ago a New England Life Insurance Company refused to grant him a policy, on the ground that he was consumptive. "But" he adds, "thanks to the healing properties of that invaluable preparation, my lungs are now perfectly sound, and I yesterday passed a medical examination without an objection being made, and insured my life for $5,000."

Pike's Tooth-Ache Drops—Cure in one minute.

GIANT POWDER.

Patented May 26, 1868.

THE ONLY SAFE BLASTING POWDER IN USE.

GIANT POWDER, NO. 1,

For hard and wet Rock, Iron, Copper, etc., and Submarine Blasting.

GIANT POWDER, NO. 2,

For medium and seamy Rock, Lime, Marble, Sulphur, Coal, Pipe Clay and Gravel Bank Blasting, Wood, etc.

Its EXCLUSIVE use saves from 30 to 60 per cent. in expenses, besides doing the work in half the time required for black powder.

☞ The only Blasting Powder nsed in Europe and the Eastern States.

Portable & Stationary Saw Mills.

MILLS FURNISHED AT SHORT NOTICE

At the lowest Market Prices.

Cazin's Combination Ore-Sizer and Concentrator—One Plunger System.

[Covered by Letters Patent of July 2d, 1872, and recent applications.]

Containing a sizing apparatus, (revolving screen) delivering two or four sizes of ore to two or four rows of sieves, each row independent of the other, and each having 5 sieves, each row concentrating according to specific gravity the special size automatically fed unto it, resulting in the simultaneous continual delivery of separated materials, working 2d and 3d-class ores into 1st-class ores of perfect cleanness. It thoroughly separates native gold or copper from quartz or any other lode matter;—galena and silver sulphurets from pyrites, baryta and quartz; and pyrites from quartz.

Added to a battery of stamps these machines constitute a full system of ore concentration, sufficient in most cases for the requirements of western mines, with a capacity of 16 or 20 tons per 24 hours.

For particulars apply to,

F. CAZIN, M. & C. E.

Supt. Denver Concentration and Smelting Co.,

SAN FRANCISCO, SATURDAY, OCTOBER 17, 1874.

VOLUME XXIX Number 16.

The Forests and Trees of Northern America.

The illustration which we give on this page of our paper, is a map of the distribution of North American forests. In stadying this snbject it seems most proper to commence with those regions which have few or no trees.

The Lacustrian Province.

Dr. Richardson, in his expedition in search of Sir John Franklin, tells ns that at the mouth of the Meckenzies river, latitade 68°, the following trees occur, generally dwarfed, bnt many showing by their annnal rings a very great age. *Betala paperacea* (Paper Birch); *Alnus incana* (Speckled alder); *A. viridis* (Green alder) *Salix lucida* (Northera willow) *Populus tremuloide* (Amer. aspen poplar); *P. balsamifera* (Balsam poplar); *Abies alba* (White sprnce), and *Juniperus communis* (Northern Juniper). Farther sonth on the Mackenzies river at the Arctic circle, 67° 30', some less hardy trees were met with; amoug which aro the *cerasus Virginiana* (Choke cherry); aad the *Abies Nigra* (Black spruce).

Crossing the basin of the Mackenzies to that of the Saskatchewan, about latitade 54°, we find, in still increasing variety, the following: *Negundo accroides* (Box elder); *cerasus Pensylvanian* (Red wild cherry); *TraxinusAmericana* (White ash); *Ulnus Americana* (White or Weeping elm), and the *Taxus canadenesis* (Ground hemlock).

At the end of Lake Winnipeg, about latitude 50°, we first meet the *Tilia Americana* (Linden basswood); *Acer Sacharinum* (Sugar; Maple) *Prunus Americana* (Northern wild plnm); *Tagus ferruginea* (Red beach); *Popolus caordicans* (Balm of Gilead poplar); and one or two of the more hardy varieties of oak. Farther east, in the basin of the St. Lawrence and lakes, the following species were added, occurring in the order here given coming eastward: *Abies canadensis* (Hemlock sprace); *B. Nigra* (Black birch), and one or two other varieties of birch, and the *Popolus grandidentatu* (Soft aspen poplar.

The Appalachian Province.

By this division is designated all that pert of the Atlantic States south of latitude 43 deg. and East of the borders of the prairie which commencing at the west of Leke Erie forms a cnrve nearly parallel to the Atlantic coast. All thie was originally covered by a dense forest, of remarkable richness—both in the variety and beauty of its trees—in this respect sarpassing any other part of the temperate zone, and even many parts of the tropical. Tbis province ie snbdivided into 6 regions: 1, the Alleghanian; 2, the Ohio; 3, the Tennessee; 4, the Carolina; 5, the Miseissippi; and 6, the Florida. The reader will at once recognize the impossibility of giving here a list of trees found in this wide and fruitful region.

The Campestrian Province.

The word "Campestrian" is here used to expres the most marked characteristic of the "Prairie" and great "Central Plain" regions of North America, which consists in their comparative destitution of foreste and nearly uniform surface; gradually rising from the level of the Gulf of Mexico, to the base of the Rocky Mountains, where they attain an elevation of from 4,000 to 5,000 feet. The eastern boandary of this province has been already mentioned as forming the western boundary of the Appalachian, and the soathwestern limit to the Lacustrian Provinces. Commencing at the Rocky Monntains in latitnde 60 deg. it runs southeast to the south end of Lake Winnepig latitude 50 deg., then, sweeping round with a curve, crosses Leke Michigan abont latitnde 43 deg. and termiaates at the west end of Lake Erie, latitnde 42 deg. Then turniag abruptly at a right angle it curves parallel to the Atlaatic coast in a southwest direction, and ends at the mouth of the Sabine river; the western boundary of Lonisiana.

This province may be divided into five regions of abont equal size, and with dietinct characteristics, viz: the Saskatchewan, (l) embraciug all north of latitude 49 deg., together with the basin of the Winnipeg, or the North Red River; the Illinois, (k), or eastern region, bonnded for the present by the forest provinces on the east, tbe 97th meridian on the west, the 38 deg. of latitude on the south, and the 46th on the North. The Texas regiou (j), next sonthward, and exteading West to the 101 deg. of longitude on the Rio Grende, while the remaioing bare plains East of the Rocky Mounteins are divided by latitnde 38 deg., into the Dacotah region, nortbward, and the Camancba, southward of it.

The first two of these regions have no peculiar trees, and the three remaining regions being almost entirely woodless, there are of conrse very few species of trees; but a few stragglers occur in them belonging to the Monntain regions of the West, none of these, however, are sufficiently abundant or luxuriant to be of much use.

In Amador connty during the last year there were 83,450 tons of ore crushed. There are 15 qnartz mills in the connty. There are also 11 miniag ditches, 296 milee long in the aggregate. There were 2890 tons of coal mined.

The Monitor & Northwestern mill, Alpine connty, is at present shut down, a wheel having broken. At least a week'e time must elapse before work can be resnmed.

The Vallejo Foundry ie making the castiogs for a quicksilver furnace of the Neate pattern for Amos Roberte, to be set up at his Colusa mine.

Quicksilver mining is going ahead rapidly in the neighborhood of Cambria, San Luis Obisbo county.

The Globe Iron Works.—Theae works now employ 35 hands. The machinery is driven by a ten horse-power engine. The specialty of the works is eaw mill machiuery, on which Frank Huntington is thoroughly posted, he haviag several patents on that class of machinery. A pony saw mill is now being built, intended for cutting "cants." A double circuler saw mill to be driven by a 60 horse-power engine is also beiag put np. It is expected to cut 25 M per day. These works do a business of $75,000 annnally. The iron work of the "Dexter" windmill is made here. One of these windmills is being set np at Bridgeport, above Vallejo, for W. W. Mason. It is intended for griading barley, and is calculated to grind 300 bushels per day. The power is equal to 20 horse. Another of these mills may be seen at St. Mary's College, in this city, one on the corner of Sixth and Brannan streets. About 125 of these windmills are in operation, many of them in Oakland. J. W. Pearson is building a very large one at Oakland point, intended to fill a 20,000 gellon tank. The pump is double acting, four inches in diameter and eight-inch stroke, and is capable of discharging 80 gallons psr minute.

The Carson *Tribune* of October 3d says: It is now known beyond any doubt thet the hills surroanding Eagle valley ere deposits of ore, rich, and to all eppearances of considerable extent. The North Cerson, the first discovered, is acknowledged to be as good a ledge as any on the Comstock lode; and Eegle Valley is turning out to be equally rich. It is also reported that the mine to the westward of Carson, which was discovered a few months since by the Roach brothers, shows indications of becoming a permauent and paying institution.

It is reported that new diggings have been struck on Snake creek, about thirty milee north of Pierce City, W. T., which promise well as far as prospected.

Ore Shipment.—At present the daily shipments of ore over the Virginia and Tnckee railroad to the various mills amoants to about 1,500,000 pounds.

Hydraulic miners in Nevada county are preparing for active operations after the first rains.

Sam Brannan telke of starting a custom quartz mill at Calistoga.

Sale of the Black Hawk Property.

A very important mining sale was consammated in Colorado on the 30th ult. The Black Hawk property was closed out—mines, pnmp and machinery. This company, throngh attempting to work in the former years of Indian blockade, excessive high freights, end higher priced labor, had becomo insolvent, and its property had passed into the hands of Mr. Jackson, of New York. He is becomiag old, and wiehed to close out his interests in Colorado, and thus wind np this portion of hie business even thongh it should he at a considerable sacrifice. The *Register* says that the first property sold was that of No. 8 east on the Bobtail, 100 feet, which was purchased by Mr. La France and his partner, backed by Jake Kruse, for $1,500 cash down.

The next eale was to Jeromo B. Cheffee, of 72 feet on the Bobtail hetween the Fields and Sterling properties, Nos. 16 aad 17 west on the Gregory, and 200 feet on the Mammoth adjoiniag the Mohler property, for the total sam of $14,500. The third sale was to the Briggs Bros., of 300 feet on the Gregory, adjoining the Briggs property, and including the great Cornish pump and the mill on No. 1, for $50,000 cash in band; making total sales of $66,000. This latter sale is vastly the most importaut. It was the the hig Cornish pump on this property that hes been draining the whole adjacent country, and making it possible te work the various eurrounding mines. The pnmp has been rnnning for the past six months, and has thus dreined other properties; but the fear lest it should stop on the 1st of October or soon thereafter, prevented anyone taking hold to work systematically.

The Betes, Fiske, Bobteil, Gregory, Hanter, Milwaukee, Mammoth, and twenty other valnable lodes, are all connected by natural snbterraneous water courses, so that the drainege of one is the drainage of all. Millions of dollars' worth of miniag property is thus directly affected, aud will be worked as soon as arrangements can be completed. The change will augment the bullion shipmente half a million of dollars between tbis and the first of March next—after that time the increase will be much larger.

Prior to this sale, the *Register* says, there has been the best of feeling in miniog circles, and tbis traasaction has rendered it still more buoyant. The fact that the purchase was by Gilpin coanty men, with their own money, for the purpose of working it, and not for speculation, should establish the confidence of even the most wavering. During the coming year hundreds more of miners will be ueeded. The Black Hawk mill will remain in the haade of Mr. Congdon, and will work on custom ore.

Shut Down.—The Santiago mill, on Carson river, has been shut down for repairs, and will not start up again before the first of November.

The currency value of the gold taken out of the Ophir mine, on the Barroughs lode, Calaveras, for ten yeare was $171,568.

A controling interest in the Oakland qaicksilver miae has been sold to San Francisco parties.

Quicksilver has lately been discovered in the viciaity of Bridgeport, Mono county.

Low Grade Ores.

That the great mineral wealth of Colorado, says the *Miner*, lies in its untold millions of tons of low grade ores, is a proposition that admits of no question. There are hundreds of lodes in this county, strong veins, which are not worked because the ores do not carry a sufficient amount of the precious metals to enable them to be treated with profit in our reduction works. This difficulty to a great extent will be obviated, in time, by thorough and extensive systems of concentration. For the ores throughout our silver belt, that are low grade, this will be the surest and most economical process. The works at the Terrible mine, at Dr. Pohle's mill, and at Mr. Cullom's, have demonstrated the fessibility of this process.

It is true, our mines are yielding an enormous amount of bullion now, but it is from high grade ores—mineral carrying over a hundred ounces of silver to the ton. Ores running much less than this amount scarcely pay for mining, hauling and milling. When the facilities for concentration are increased, the ore product of this section can be increased in proportion. Every year adds to the ability of our mill men to treat ores more successfully and at less expense, and we think the time is not distant when our low grade ores will prove sources of wealth to the owners of the strong veins that carry them.

The mill men in Gilpin county have, the past summer, demonstrated the feasibility of working to profit auriferous ore running only seven dollars to the ton. The *Register* gives the following instances:

"During the month ending sometime in August, Bela S. Buell, Esq., mined, hauled more than a mile to his mill, and crushed 1,400 tons of ore, which yielded less than $7 dollars per ton. This paid a handsome net profit after deducting cost of mining, timbering of mine, and keeping it in good order, wear and tear of machinery, transportation, reduction, salaries, etc., in short all the expenses of mining, which could accrue to a mine which, unlike his, should produce low grade ores. About a month ago he got thirty stamps of his new mill located over his mine in motion. He had to contend with the newness of the mill, and the impurities of the water, his water supply having been but partially provided for as yet. To avoid loss, he has been crushing material which has not hitherto been ranked as ore by him, yielding only two and a half ounces of bullion per cord, or six dollars and forty-three cents currency per ton, and yet this has returned a fair net profit after deducting from the gross proceeds every item of expense incurred.

"A. N. Rogers, Esq., agent for the Bobtail company, has been making a like experiment. The Bobtail, as everybody knows, is one of the richest gold mine in the world. It has an immense amount of rich mineral in sight, but like every other mine it has some lean ground, and following the universal custom of every mining country, the low grade ores have been left unbroken. Mr. Rogers has been desirous of testing the availability of low grade ores and has been during the past few months taking out such as has been formerly neglected. The company's mill is little over a mile from the mouth of the tunnel. To it the ores have been hauled, and in it crushed by common stamp process, and the gold amalgamated on copper tables and in sluices. He has kept accounts with the greatest care, charging up every expense, including what is known in mining parlance as 'dead work,' salaries, wear and tear of machinery, etc. He has taken the whole mass of low grade ore, and finds that the average yield has been $7.70 per ton, and that it has paid a handsome net profit at that rate. Other like tests have been made with like results. This proves conclusively that ores producing from $6.50 to $8, whether occurring in connection with richer ores in the older, and well worked mines, or in strong veins, where low grade ores exist, can be worked with profit. This shows an actual value to almost every mineral vein in the county. The working of them cannot fail to give unequaled prosperity to this region."

The gold-bearing veins about Empire, in this county, if opened and developed, could keep several large mills employed, and would add immensely to the bullion product of the county. There is no doubt that the mining district we refer to contains some of the largest and best gold-bearing lodes in the Territory; and we trust the experiments that have infused new life into mining operations in Gilpin county will stimulate the rapid development of the great gold-bearing lodes that intersect the mountains north and west of Empire, and the speedy opening-up of the valuable gold lodes on Chicago creek.

As long ago as 1860, low-grade auriferous ores of very refractory character, from the Reichenstein mine in Silesia, were treated with profit. It is true that such ore could not be made profitable here, subjected to the same treatment, on account of the greater cost of labor and fuel.

We append a description of the process, to show what poor ore can be profitably worked, with proper machinery and cheap labor.

"The ores of this mine are arsenical pyrites, and contain about 200 grains of gold to the ton. These are roasted in a reverberatory furnace, surmounted by a large condensing chamber, in which the arsenic is deposited as it rises in fumes. Oxide of iron, a certain quantity of arsenic and the gold in the ore remain beneath. These are placed in a vessel, so that a current of chlorine gas is sent through them. The gold and iron attached are separated from the residue by solution in water, and the gold is precipated by sulphuretted hydrogen. It is then washed and heated in a crucible, to drive off the sulphur, and the gold is reduced to the metallic state in the usual manner."

Jefferson River Mines.—The *New Northwest* (M. T.) says: Development of the Jefferson river mines has now progressed sufficiently to demonstrate that there is good paying ground in the cañon, and prospecting along the bars of the river, from there to Stinkingwater, gives fair promises that the pay is not confined to the cañon alone. The prospects and yield in the cañon, so far as we can learn, are good. But there is a very heavy expense attendant upon mining as at present conducted, and only a limited portion of the river bed can be got at. The methods of turning out the water as employed by old California river miners have not proved sufficient to resist the Jefforson, and stronger dams have to be put in. The method now in use is to start from the bank with bottomless boxes of 1½ inch plank, 12 feet long, 5 feet wide, and as high as necessary to turn the current. These are braced inside and taper like a sluice-box. The first one is forced in well down on the river bed, and dirt is then wheeled in and tamped down solid. When the box is full the projecting end is cleaned out and another box forced in and the process repeated until the desired ground has been "winged" off. This is tedious, expensive, and sometimes not proof against strong pressure. Wheels are then put up to pump out the water. Current wheels have generally been used for this purpose but have proven inadequate and are being superceded by overshots or steam engines. Probably not more than six or seven companies will get their ground well opened this season. There are 175 men in the mines.

Fire Trains.—The Central Pacific Railroad company employ no less than four fire trains on the mountain route across the Sierra. The first is stationed at Blue Cañon, the second at Emigrant Gap, third at the Summit, and the fourth at Truckee. Each train consists of a locomotive and three or four water cars. These cars are about the same length as an ordinary freight car, and formed of two-inch plank; they are very strongly put together, as nearly water tight as possible, and are elevated above the track about four feet. Each car will hold 3,000 gallons of water, or not far from 100 barrels—equal in weight to 24,000 pounds. The locomotives are arranged with powerful pumps that throw a steady stream, and do equally as good work as the best steam fire engines used in any of the large cities. Leather hose three inches in diameter is used, which, when not in use, is wound upon a large reel mounted on one car of each train. These trains are kept in a constant readiness to proceed with all possible speed to the locality of the fire upon the first alarm. All of the 25 miles of shedding between Emigrant Gap and Truckee is thoroughly deluged with water once a week. In sprinkling the sheds the pipe-man stands on the pilot in front of the engine, which moves slowly along at the rate of two miles an hour. In this work five men are sufficient to manage a train. Since the introduction of the fire alarm telegraph, with 32 different stations between Emigrant Gap and Truckee, the danger of any very disastrous conflagration in the sheds is nearly or quite obviated.

Big Work.—Though work on the mines near Gold Run and Dutch Flat is being shut down for the season, for lack of water, the work on the two large tunnels now being run, one from Bear river, and one from the North Fork of the American river, to tap the deep and rich gravel deposits in that section, near the bed rock, is being crowded ahead with all possible dispatch. The main tunnel, the one on the Gold Run side from the American river, is in about 600 feet. The size of this tunnel is about twelve feet wide by nine feet high. Four hundred feet from the mouth of this large drift they are running a branch 8 by 8 feet. This branch tunnel is required to be about 1,000 feet in length, and the company hope to have it completed, ready for service by the first of December. They had fixed the first of January as the time for completing this branch tunnel, but have been able to make so much better headway than they had calculated, that they are now confident of getting through a month sooner. We are indebted for this information to Mr. A. G. Oliver, a merchant of Gold Run. He tells us that with a force of about 15 men the company made of this branch tunnel, during the month of August, 153 feet 6 inches. This, probably, is the best work ever done on a similar enterprise in the world. We suppose it is hardly necessary to state that they used the Burleigh drill.—*Placerville Herald.*

Ornamenting Metal Surfaces.—A new process for ornamenting metal surfaces has been recently invented in America. It consists in plating, electroplating, or otherwise covering a plate, bar, or ingot of soft metal with a thin film of harder metal, and then rolling out or pressing the ingot into a sheet; whereby the coating is broken into irregular forms, and a marbleized appearance produced on the surface of the sheet.

To Prevent Cracks in Castings.—To prevent cracks in castings, Ehrenwerth recommends castings at the lowest temperature possible. In order to accomplish this he advises as small an opening as possible for pouring the molten metal into the mould, and continuing the operation as long as practicable.

Leo Mine.

The Leo mine is one of the oldest mining locations in Gold cañon, having been located in 1860. It is situated on the east side of Gold cañon, between the Old Pride of the West and Woodville mines, and in point of location is fully equal to those of either the Woodville or Justice. Some work was done on the claim in early times, but most of the owners being poor, the developments were never sufficiently good to make it a paying mine, although many tons of good ore were extracted, some of which gave excellent returns for milling. A year ago the control of the mine passed into the hands of men who went to work in the full belief that that the prospects were amply sufficient to justify the expenditure of time and money, in the full expectation that in due time their labors would not be without a reward; nor have they been deceived, for after running some 1,200 feet of drifts, tunnels and winzes, they now have 250 tons of good milling ore on their dump ready for shipment, and their mine so opened and the pay bodies of ore sufficiently developed to begin the reduction of ores with a full assurance of a steady and continuous supply. The prospecting of the mine to the present time has cost between $25,000 and $30,000, and Mr. G. H. Moyle, the present efficient superintendent, deserves great credit for his energetic and systematic development of its resources. Yesterday morning learning that the shipment of ore, for milling, had been commenced, we visited the mine and were shown through it by the gentlemanly superintendent, who seemed to take pride in exhibiting his mine and the fine prospects of its future prosperity. Entering the mouth of the main tunnel, which is nearly on a level with the bed of the cañon, we proceeded along it 175 feet to the eastward, at which point a drift has been run in a northwesterly course, 240 feet, following the pay streak of the ledge, which varies from a few inches up to 10 feet in width, sometimes narrowing down and then again widening out as the drift advances. At a distance of 100 feet from the mouth of this drift an up-raise had been commenced, which is up 20 feet in fine ore, the vein at that point showing 5 feet of good ore. At a distance of 100 feet beyond this, another up-raise, with a chute for extracting ore, had been commenced. This raise was up only about 7 feet, the ledge at this point showing fully 7 feet in width, and the ore of an excellent quality. On the opposite side of the drift from this raise a drift was being run on a pay streak of ore extending in an easterly direction. This drift was in 30 feet, the pay streak being about 2 feet in width and gradually widening for the last 6 or 8 feet. This streak of ore seemed to be tending to the southeast, and may yet lead to a larger and more valuable development, as it is in a new and entirely unprospected portion of the mine.

Returning to the turn-table in the main tunnel, we were shown an incline winze 140 feet in depth, which had been sunk in early days, but at too flat an inclination to follow the ore vein. Believing the winze to be on the upper side of the ledge, the present superintendent had sunk it some 10 feet more in a perpendicular course, at which point the ledge was struck and a few pieces of rich ore extracted, with which came a flow of water so strong as to force the men from the shaft and stop all further proceedings in that direction until machinery of sufficient power can be erected to drain the water. Again proceeding along the main tunnel, in an easterly course 20 feet, brought us to another ore chute, and an upraise 60 feet on the vein. One hundred feet further we came to still another chute and an uprise 75 feet on the ore vein, which in places was 10 feet in width. From this point, following the ore vein to the southeastward it showed a width of from six inches to two or three feet, for a distance of 100 feet more, much of the ore being full of iron sulphurets rich in gold. Then it appeared to break into mere seams in the hard rock, which were still continued in the face of the drift a distance of 475 feet from its mouth. It is the opinion of experts who have examined both mines that this drift will not have over 50 to 100 feet further to run to tap the large white ledge found in the Succor mine, a few hundred feet further to the northward. The ore in this mine is almost entirely free from base metals, excepting iron and sulphur, is easily worked and carries a large percentage of gold value over that of the silver. Assays of the ores vary greatly, often running from $40 up to $300 per ton. Much of the decomposed ores are rich in free gold, and a hornfull washed out gave a prospect, the eight of which would make the eyes of an old Californian dance with pleasure. The shipment of ore to the Ramsdell mill has already been commenced, and crushing will be commenced to morrow. The prospects of the Leo are very flattering for a full and early realization of their long delayed expectations.—*Evening News.*

Elasticity of Rarified Air.—Two Russian observers, M. M. Mendeleeff and Kirpitschoff, have recently been studying the elasticity of rarified air. They consider that from pressures of 650mm. of mercury to 0.5mm., air not only does not follow the law of Mariotte, but deviates from it more and more in proportion as its density diminishes. The deviations of rarified air are of contrary sign to those which M. Regnault has observed in compressed air; in the latter the product increases when the pressure diminishes; in rarified air the reverse is the case. The method of these researches is described in the July number of the *Annales de Chimie et de Physique.*

Important Sale.

The Sonoma *Democrat* notes the sale of a one-half interest, undivided, by William A. Stuart, of San Francisco, of the "Knight's Valley Ranch" and the quicksilver mines thereon, the "Ida Clayton" and the "Yellow Jacket," for the sum of $100,000 cash, to Edgar W. Steele, President of the Bank of San Luis Obispo County, G. P. Kellogg, late State Agent of the California Grangers, and Charles Laird, of Salinas, all gentlemen of wealth and rare business capacity. This sale has resulted in the formation of one of the strongest companies, financially as well as for business capacity, that there is on the Pacific Coast, and the enterprise, or rather enterprises, to which they propose to give their attention are the most important directly to the counties of Sonoma and Napa that has ever been inaugurated within their borders; the details of which have not as yet been fully arranged. We may say, however, that agriculture, manufacturing and mining, will occupy prominent places. We may further say that these gentlemen have unlimited capital at their command, and anything undertaken by them will be carried through to success, as all the members of the company are noted for their intelligence, indomitable perseverance and energy. They have organized under the name and style of the Knight's Valley Land and Contract Company. The following gentlemen compose the firm: Edgar W. Steele (President of the Bank of San Luis Obispo), Manager Land Department; Wm. A. Stuart, Manager Mineral Department; Wm. S. Bartlett (Loan Teller National Gold Bank and Trust Co., San Francisco), Manager Financial Department. The associated partners are E. W. Steele, Charles Laird, Alex. Elder, G. P. Kellogg, Wm. A. Stuart and Wm. S. Bartlett.

The importance of this enterprise, particularly to the prosperity of Sonoma and Napa counties, is beyond comprehension to the casual reader; yet, when the plans and undertakings of this company begin to unfold and be developed in their magnitude, then will people begin to realize the facts. To the genius of one man, his untiring perseverance and energy in surmounting every obstacle, in securing the Knight's Valley Ranch property, and in the formation of this company, and bringing the whole matter to a successful issue; to the conception of the enterprises to which the company propose to give their attention, all is due to Wm. A. Stuart, of the firm of Stuart and Elder, 204 Front street, San Francisco. The people of Sonoma and Napa counties have much to thank Mr. Stuart for, as it is to his unwavering energy and unstinted expenditure of money that Sonoma county to-day owes the development of her vast mineral resources.

The Chinamen at Panamint.—Capital has gone into Panamint District, Inyo county, Cal., and everything there is bustle and confusion. A large number of men are wanted and some Chinamen were sent down. A correspondent writes as follows to the *Independent* on this subject: "Considerable excitement prevails here now over a rumor that a certain company of this place intend to employ Chinamen in working their mines, and that a large force of them is now en route from Los Angeles. I would suggest to any parties desiring to introduce coolie labor that it would be well to provide themselves with balloons. The cañon is very narrow, in places not over 10 feet in width, and the boys to a man swear that no force of Chinamen shall be allowed to enter it for the purpose of working in the capacity of miners. In view of this fact their only recourse will be by balloon, as the only entrance is through the cañon." The miners seem to have become excited without cause since in a speech at Panamint the other day, Senator Stewart told the miners that he did not propose to put Chinamen at work on the mines but simply at road building and such work. He also stated that he was ready and desirous of employing every man in the camp, willing to work, at $4 per day. His talk gave general satisfaction in every way.

Sierra Nevada Water.—Before the introduction of pure mountain water by the Virginia and Gold Hill Water company, engineers were greatly annoyed by the incrustations which constantly formed inside steam boilers. In many instances a general overhauling and cleaning out was necessary each week, and men were sent in with hammers to scale off the hardened sediment, which could not be got rid of otherwise. At some mines patent heaters were used, which precipitated the earthy particles contained in the water before the steam was allowed to enter the boilers at all. Now, however, all such difficulties are obviated. The Sierra Nevada water, with which the city is now supplied, is so pure and soft that a cleaning out once a month is all that is required to keep a boiler in good condition. Not one-half the repairs formerly needed are now necessary, and a saving of thousands of dollars monthly at the different quartz mills and hoisting-works along the Comstock is made by the use of the new water. Its beneficial effects upon the health of our citizens also is apparent, as it contains no alkali, antimony nor arsenic, with which the water formerly derived from old tunnels was impregnated.—*Virginia Chronicle.*

New Strikes, with rich prospects, are reported on Mullins' Gulch, Mariposa County.

The Silver City Miners' Union have concluded not to build a hall at present.

MECHANICAL PROGRESS.

Smoke Consumption.

A correspondent of the *Scientific American* offers the following suggestions bearing upon the subject of smoke consumption: "In nearly all the furnaces used under boilers there is too little space between the grate bars and the bottom of the boiler (it is often 12 inches to 15 inches; when it would be better 24 inches to 30 inches), and that every fireman, taking boiler, grate and furnace exactly as he has it, can control and very largely prevent the smoke by simply firing on one side only of his furnace at a time, leaving the other side of the fire clear and hot until its own turn for firing comes, and by a careful admission of air by merely leaving the door slightly open. It may be urged that there is nothing new in either of these suggestions (which is perfectly true) but a wise attention to them—and wisdom, even in a fireman, is an essential element to success—will go a long way toward remedying the evil."

What the above correspondent says in regard to space between the grate-bars and boilers is corroborated by the following, which we find in an exchange: "A steam boiler of novel construction has been recently placed in Franklin, Upton & Co.'s tannery at Peabody, Mass. Its principal merit lies in the fact that the gases and smoke given out by the burning fuel, and which usually go out of the chimney, are thoroughly consumed, and therefore the waste of power is reduced to a minimum. Hitherto it has been the practice for the fire grates to be placed within 18 inches of the boiler, and the bridge wall carried up to within six inches of the boiler, in order to secure the best results. In this case we learn that the distance from the grates to the boiler is 30 inches, and from the bridge wall to the boiler 13 inches. There is a space one inch wide between the outer wall and the inner fire wall, through which air from the outside passes, and becoming heated *in transitu*, is admitted into the flame through a perforated iron plate. By this means an almost perfect combustion is caused."

Leatherette—A New Material.

The British *Trade Journal*, describes the above article—a new patent imitation of leather—as follows: It is so good an imitation that a superficial observer would, in nine cases out of ten, take it for the real article. The grains of the different kinds of leather, such as basil, seal, morocco, etc., are reproduced with a fidelity quite remarkable. In the process of "graining," a real skin of leather of any given description, which it may be desired to imitate, is taken as a mould, and from this an impression is obtained on sheets of fibrous pulp by the exercise of enormous pressure. Thus the grain of the imitation article is an actual facsimile of that of the real. Leatherette is obtainable in any color, and, while it is only about one-eighth the cost of leather, possesses some manifest advantages over the latter, which will scarcely fail to make it a commercial success. For instance, it is stronger than leather of the same thickness, and is of uniform quality, so that forty or fifty forms may be cut at a time, while the blemishes that occur in leather necessitate each form being cut singly, and that by experienced, and therefore expensive hands. It is not so prone to soil, and is waterproof. The scope afforded in different trades for the utilization of such an article is obviously great. Upholsters, hat linera, box makers, purse makers, bookbinders, etc., may, among others, turn it to useful account. For hook-binding it is admirably adapted, and probably in this branch of trade will work no small revolution, seeing that it affords handsome and realistic bindings at such a reduced cost. There can be no doubt that leatherette is an important invention.

DEPOSITS IN BOILER FLUES.—Concerning the formation of deposits in boiler flues, about which a considerable amount of speculation has been published, Prof. Hayes gives the following opinion in a late issue of the *American Chemist:* These are of two kinds, both of which are capable of corroding the iron rapidly, especially when the boilers are heated and in operation. The most common one consists of soot, nearly pure carbon, saturated with pyroligneous acid, and contains a large proportion of iron, if the deposit has been an old one, or very little iron, if the deposit has been recently formed. The other has a basis of soot and fine coal ashes, silicate of alumina, filled with sulphur acids, and containing more or less iron, the quantity determined by the age of the deposit. The pyroligneous deposits are always caused by want of judgment in kindling the fires. The boiler being cold, the fires are generally started with wood; pyroligneous acid then distils over into the tubes, and collecting with the soot already there from the first kindling, forms the nucleus for the deposit, which soon becomes permanent and more dangerous every time wood is used in the fireplace afterward. The sulphur acid deposits derive their sulphur from the coals used; but the base, holding their acid, is at first occasioned by cleaning or shaking the grates, soon after adding fresh charges of coal. Fine ashes are thus driven into the fines at the opportune moment for them to become absorbants for the sulphur compound distilling from the coals, and the corrosion of the iron follows rapidly after the formation of these deposits.

Why Iron Castings are Accurate Copies of the Mould.

Robert Mallet furnishes the *Engineer* with a lengthy but interesting paper upon this subject, from which we condense as follows: The fact that iron does take, very accurately, the form of the mould in which it is cast, has long been attributed to the supposed fact that this metal expands in volume when cooling—a supposition which has passed current for a century, but without sufficient proof to establish it as a fact. Recent experiments, however, have proven that iron does not expand in cooling.

But even if iron *did* so expand, the casting could not be an exact copy of the mould, from the fact that the expansion would distort the mould wherever the walls were least resistant. For example a flat plate, moulded from a pattern of equal thickness throughout, would have one or both of its surfaces forced outwards so as to make the plate thickest toward the central parts, while the edges or corners would remain nearly unaltered.

Cast iron does, however, as is well known, take the form of the mould, as formed of sand or loam by the usual methods of the founders, with great fidelity, except in case of chills or moulds of cast iron, the liquid metal cast into which is so instantly chilled by contact as not to form a very accurate transcript of the mould. It does not do so, however, to a quarter the extent that do several metals to which the property of expanding in consolidation has never been attributed, as zinc and lead. Gold, silver, copper, and most of their alloys afford less perfect castings.

The circumstances upon which these results arise undoubtedly involve conditions mechanical, chemical and molecular. Density is considered one of the most important, and is the mechanical force by which it is compelled to fill the sinuosities of a mould. Gold in this respect should form the most perfect casting; but, in fact, it is very inferior to iron.

The specific capillarity of a metal when in fusion, and its viscosity while cooling is considered by Mr. Mallet as having a very important influence in producing a perfect casting. Different metals are liquid in very different degrees while in perfect fusion, and therefore require very different degrees of pressure to force them into angular cavities. Upon this point physicists have as yet given us but little exact information. The greatest diameter of spherical drops capable of being assumed by any metal when taken in connection with its density is, however, a rough measure of the resistance which each presents to being forced into angular cavities of a mould of such material that it is not wetted by the liquid metal. Drops of mercury cohere at larger diameters than those of liquid lead. So also different metals differ in the range of viscosity through which they pass between their state of most perfect liquidity and that of solidity. Lead and some of its alloys, such as plumber's solder, pass through a very long range of viscosity; brass and copper do also likewise, though in less degree; cast iron, and in general all the metals that crystallize most readily and best, pass through a very brief stage of viscosity. Where the melting point of the metal is a low one, one of the effects of this prolonged viscous stage, during which the metal contracts by loss of heat, is that its withdrawal from the sides of the mould is not compensated by a sufficient continuance of hydrostatic pressure, owing to imperfect liquidity. Cast iron is remarkably free from this objection; its melting point being very high, and its range of viscosity small and confined to a small range of temperature, the metal is maintained, though constantly contracting by loss of temperature, in close contact with the mould by hydrostatic pressure up to within a brief period of its setting.

The third hindrance to perfect casting is the tendency of the metal to oxidize. Melted zinc oxidizes but very slowly up to a temperature somewhat above its melting point, but rapidly at and above a bright red heat; hence zinc gives perfect castings; but when it is alloyed with copper the melting point of the brass is raised to such a point that the zinc oxidizes very rapidly, and produces that "tailing" and general scurfiness of surface which is the plague of the brass founder, and the oxide of zinc is not reducible back to metal at the temperature at which brass is cast by any chemical agent capable of being introduced into the substance of the mould.

In cast iron, on the other hand, its tendency to oxidize by contact with the atmosphere when in fusion is opposed by the presence of silicon and carbon in the metal itself, and any oxide superficially formed is reduced back to metal with great facility by the hydrogen and carbonic oxide evolved from the moisture and charcoal, or coaldust, or other carbonaceous matter entering into the constituents of the mould. Gold is inoxidisable, but possesses a vigorous affinity for sulphur, and it is probable that the film which may be observed upon the surface of molten gold in casting, and which produces "tailiness" in the ingot or bar, consists of some sulphur compound taken up from the gases from the fuel employed for fusing it. Copper also casts badly, as when in fusion it is constantly either taking up carbon or oxygen as the heat of the furnace is either a reducing or an oxidating one, and the great cleanness of castings produced from phosphorised copper arises from the presence of the small amount of that element precluding it from taking up carbon, on the one hand, and shielding it from oxidation on the other.

SCIENTIFIC PROGRESS.

INFLUENCE OF CARBONIC ACID ON THE GROWTH AND COLOR OF PLANTS.—Starting with the supposition that at a former period of the earth's history vegetation was incomparably more luxuriant than at present, and that this was largely due to the much greater quantity of carbonic acid in the atmosphere, Joa. Boehm instituted some experiments on the green color of plants and the germination of seed in atmospheres containing definite quantities of carbonic acid. The results obtained showed that in air containing only 2 per cent. of that gas the formation of chlorophyl was much slower, while in an atmosphere containing 20 per cent. it ceased entirely, or nearly so, according to the kind of plant experimented upon. In like manner a larger or smaller quantity of carbonic acid retarded more or less the germination of seed. Some moistened beans were kept for eight days in equal parts of air and carbonic acid, and at the end of this time did not show the slightest indication of sprouting, and grew as usual when left in the open air. Boehm deduces this alternative conclusion from his experiments: Either the hypothesis that the atmosphere was richer in carbonic acid than now is false, or else that the plants of a former time must have been less sensitive to carbonic acid than their successors of to-day. The former hypothesis agrees with the view that the atmosphere is unlimited, and relieves us from any anxiety as to the unchangeableness in the future of the principal food of plants.

RETARDATION OF THE VELOCITY OF ELECTRICITY.—At the session of the American Association for the Advancement of Science, recently held at Hartford, Conn., Professor Lovering, the president of the association, read an address on "Recent Advances in Science," in which he thus refers to advances in electrical science:—"Wheatstone (he said) by a revolving mirror, determined the velocity of electricity, the duration of electrical discharges, and the duality in the direction of the transmitted disturbances. Feddersen, and more recently our own associate, Rood, repeated his experiments. Indirectly the velocity of electricity thus ascertained (and the greatest known except that of gravitation) has been tested by signals through long lines of land and ocean telegraph, giving a lower figure than that of Wheatstone. But the anomaly is due to a misinterpretation. That electricity moves through a quarter of a mile of wire at the rate of 288,000 miles in a second is not evidence that it would move over 288,000 miles in one second. Electricity has no velocity in the ordinary sense. The transmission of the electrical disturbance is proportional to the square of the disturbance to be transmitted; therefore the velocity varies with the length of the journey."

ENDOSMOSIS—SINGULAR FACTS.—It has recently been noticed that if the membrane which lines the interior of an egg shell be used to close the tube of an osdometer, the latter being filled with sugar and water, and its containing vase with pure water, an odd circumstance will be noted. If the external surface of the membrane is towards the pure water, endosmosis is very rapid, and the water rises at the rate of some four inches per hour. But if, on the contrary, the interior surface is turned to the water, the phenomenon is almost annihilated. Matteuci, it appears, has noticed a somewhat similar peculiarity in the skin of a frog. It would seem that the phenomenon is worthy of study, since it shows that a liquid does not traverse the interior of a cellule with the same facility outward as in the contrary direction.

ETHER AND ATOMS.—Professor Lovering, late president of the American Association for the Advancement of Science, in an address delivered on the 12th of August to this society, called attention to the fact that Professor Challis, in an elaborate work, has discussed the interplay between ether and atoms, and the theory may now be regarded no longer as a speculation, but as a physical reality, with substantial mathematical support. He does not yet claim full mathematical proof, but his work is a guide post that unmistakeably points the way. In one respect the theories of Le Sage and Challis coincide. The driving storm of atoms must come from outside the world of stars; the universe is not even temporarily automatic, but must be fed continuously by an agency external to itself. Our science thus is not a finality.

THE ETHEREAL BLUE COLOR OF THE SKY is due to minute particles of matter which float in the air. Were these particles removed, the appearance of the sky would be dead black. It is a fact in optics that exceedingly fine portions of matter disperse or scatter the blue rays of light, coarser portions scatter red rays, still coarser portions scatter all the rays, making white light. The atmosphere is full of aqueous vapor, the particles of which diffuse white light in all directions. When these particles are enlarged, they become visible in the form of clouds. The vapor particles of the white clouds are supposed to be finer and thinner than those of the dark clouds. That the diffusion of light in our atmosphere, the blue coloring of the sky, and the colors of the clouds, are due to the presence of matter floating in the air, has been conclusively proven by Tyndell.

Progress in Astronomical Discovery—The Lights in the Heavens.

We clip the following from the published proceedings of the French Association of Science: The spectroscope has explored the far-off space of heaven. The light of hundreds of stars has been analyzed, and nebulæ, scarcely visible, have had the quality of their radiations revealed by its aid. The light, in some cases very feeble, with which a number of stars shine, gives a spectrum with dark lines like the solar spectrum, and this fact proves to us that the constitution of these stars is like that of our sun. Aldebaran sends us records of hydrogen, magnesium, and calcium, which abound in solar light, but also those of metals which are rare or absent, as tellurium, antimony, and mercury.

Nebulæ, twenty thousand times less brilliant than a candle at a distance of 13,000 feet, have still given a spectrum; for their light, although feeble, is very simple in its constitution, and the spectrum which it gives consists only of two or three bright bands, one of hydrogen, the other of nitrogen. These nebulæ, which give a spectrum of bright lines, are those which the most powerful telescopes cannot resolve; there is an "abyss" between them and resolvable nebulæ, which like ordinary stars, give a spectrum with dark lines.

What an effort of the human mind! To discover the constitution of stars of which the distances are unknown, of nebulæ which are not yet worlds; to establish a classification of all the stars, and still more to guess their ages—ah, tell me, is not this a triumph for Science? Yes, we have classed them according to their ages. Stars colored, stars yellow, stars white; the white are the hottest and the youngest; their spectrum is composed of a few lines only, and these lines are dark. Hydrogen predominates. Traces of magnesium are also met with, of iron, and perhaps of iodium; and if it is true that Sirius was a red star in the time of the ancients, it owed perhaps its tint to the greater abundance of hydrogen at that epoch. Our sun, Aldebaran, Arcturus, are among the yellow stars. In their spectra the hydrogen lines are less developed, but the metallic lines are fine and numerous. The colored stars are not so hot and are older. In consequence of their age, they emit less vivid light. In them there is little or no hydrogen. Metallic lines abound, but one also finds channelled spaces like the lines of compounds. The temperature being lower, these latter can exist whether they consist of atoms joined to others of the same kind, or whether they contain groups of heterogeneous atoms.

As to matter, it is everywhere the same, and the hydrogen of water we meet with in our sun, in Sirius, and in the nebulæ, everywhere it moves, everywhere it vibrates; and these movements which appear to us inseparable from atoms are also the origin of all physical and chemical force.

WATER SPOUTS.—The following details of a new theory of waterspouts are from the *Journal of the Franklin Institute:* "It has been hitherto assumed that the column of air which revolves to produce a waterspout is an ascending column. M. Faye, the astronomer, has recently maintained before the French Academy the theory that these columns of air are descending ones. Precisely as in a river, vertical layers of water, moving with different velocities, form whirlpools in shape like funnels, drawing the water away from the center, so, when currents of air above the clouds move in different directions, or in the same direction with different velocities, they produce upon their borders a gyratory motion of the interposed air. This air descends like the water in the whirlpool, and if the gyratory movement be powerful enough the tube of rotating air may reach the earth. At the same time the centrifugal force determines the matter to the exterior, and causes a partial vacuum in the interior, thus explaining the lifting of objects over which the whirlwind passes, and in the case of water producing waterspouts. Of course the barometer in the center experiences a sudden fall. The solar spots Faye explains in this way, supposing them to be in a whirlwind seen vertically. The solar gas drawn into them being cooler, appears as the dark umbra."

LATENT HEAT OF STEAM.—During the change of water into steam, a remarkable phenomenon is said to have been recently discovered, which is nothing less than the apparent disappearance of large amounts of heat, which appear to be consumed in order to overcome the cohesion of the water particles, and change it into a repulsion, which is the cause of the expansive elasticity of the steam, and results in the useful application of its pressure. The heat which thus disappears is called the latent heat of steam, and it reappears again as soon as the gaseous steam returns to the condition of liquid water. The amount of this heat is about 1,000 units; that means, in order to convert 1 lb. of water of 212 deg. into steam of the same temperature, 1,000 units of heat will disappear, or as much heat as would suffice to heat 1,000 lbs. of water 1 deg., 100 lbs. 10 deg., or 10 lbs. 100 deg.; consequently, as one 1 lb. of anthracite coal gives 14,220 units of heat, it will convert 14.2 lbs. of water, and bituminous coal 13.5 lbs. of water into steam. The amount of expansion which the water undergoes during this change is an increase in bulk of about 1,700 times; and as 1 cubic foot contains 1,728 cubic inches, the usual statement that every cubic inch of water becomes a cubic foot of steam is nearly correct for practical purposes.

Weekly Variations in Stocks.

[Based on Regular Sales of the most important Stocks on the San Francisco Stock and Exchange Board.]

For 6 days ending Wednesday, Oct. 14, 1874.

Mining Stocks.

There hes been e marked decline along the line during the pest few days. The volume of business is still large, however, though prices are lower than they heve been for the pest few weeks. Concerning the Comstock mines the *Enterprise* pertinently eays: Our mines are all looking exceedingly well. Newmines are being constently edded to the list of those thet are sending ore to the mills, and those that have lately begun milling ere increasing their yield. The Ophir, for instance, to-dey is running two mills and will soon have three running. Thie ie the mine which the manipulators at the "Bey" and their orgene among the newepepers down there constently cried down when it was announced that there hed been developed in it a body of good ore. By their lies ehout the mine they kept all men of moderete meeus from pnrchasing the stock. From the first striking of the ore up to the preeent time we heve given truthful reporte of the condition of the mine week after week, but the miners "drifting" ahout Celifornie street end reporting their discoveries through their home newspepers gave their Sen Francisco friends other advicee. The Empire will shortly he milling ore, hut the fect will probably not he acknowledged ont of the State for some months to come.

AN OLD MINER telle the *Humboldt Register* that he and four others struck plecer mines ahont 150 miles north of Rollins Station on the U. P R. R., thet will pey from five to fifty cente to the pen. They ettempted to work the mines, hut were run off by the Indiane. He is now on hie wey to California to organize a compeny of miners strong enough to stend the Indiane off, end will return with them in the spring to the diggings.

THE mechinery for the Reymond & Ely compeny continues to arrive at Pioche deily.

THE Coos conty *Record* a new peper puhlished et Merehfield, Oregon, by C. W. Tower & M. L. Hanscom, the letter lete of the Ætne Foundry of thie city, eaye thet Mr. Crouch, the inventor of the Cronch euperheeting engine, which censed some stir in mechanicel circlee, some months eince, will prohehly stert a foundry and machine shop on Coos Bey this fell. The *Record* thinks there is a good opening for the nnderteking.

IN the month of Angust the Boston and Colorado Smelting compeny peid out $154,000, $140,000 of which wes for ore. The monthly everege snm peid ont hy the compeny, says the Colorado *Register*, for six months previous to thet time, was, in round numbere, $125,000. Since August 29th they heve turned ont 125,800 onncee of silver, worth $169,830, and 2,000 ounces of gold, worth $40,000.

THE Northern Belle compeny will immediately commence the construction of a 20-etamp mill. The *Borax Miner* says: With twenty etemps crushing Northern Belle ore, end onr steady going little five-stamps stend-hy doing the cnstom work for numerone other mines, a brighter futnre is in etore for Columhus.

THE Tacoma *Tribune* says: "Dr. O'Brien cleime to have discovered e cinneher ledge on the ehore of Fidalgo Island. He bronght np to the eound with him some of the rock end asseyed it, producing pure and heentiful quicksilver.

A MINER who worke in the Crown Point for $4 per day, hee elreedy amaseed the hendsome sum of $50,000 hy lucky ventures in stocke. How many others have lost hy etock veutures is not steted.

THE weter in the Cereon river hae reeched ite lowest point during the eeeson, end ie coming np gredually, owing to the decrease of evaporetion.

OPERATIONS have heen agein resumed on the Page & Penaca mine, at Pioche.

New Incorporations.

The following companies have filed certificates of incorporation in the County Clerk's Office, San Francisco:

SILVER RIDGE G. AND S. M. Co. Oct. 8. Location: Calistoga Mining district, Napa county. Directors: Joseph Mossheimer, James P. Goodman, A. Wason, H. K. Bolsford and T. B Shannon. Capital stock, $2,500,000.

SOUTH WOODVILLE S. M. Co. — Oct. 3. Location: Gold Hill Mining district, Storey county, Nevada. Directors: Robert Sherwood, J. D. Fry, William Sherman, J. Wall and J. R. Lee. Capital stock, $6,000,000.

NEUFCHATEL PAVEMENT Co.—Oct. 13. The purpose for which this organization is formed is the construction of street pavements in thie city, and of purchasing and importing the Neufchatel rock and other material for that purpose. Directors: Cornelius Oole, Benj. S. Brooks, Franklin D. Cottle, Geo. K. Porter and Wm. Livingston. Capital stock, $1,500,000.

Increase of Capital Stock, Etc.

The certificate of capital stock of the Woodville Gold and Silver Mining company was filed on the 14th. The capital stock has been increased from $2,800,000 to $6,000,000. The certificate states that the amount of the capital stock actually paid in is $300,000, and that the debts of the company are $95,000.

Meetings and Elections.

JULIA G. AND S. M. Co.—Oct. 12. Directors: Thos. Cole, Hill Beachy, M. D. Townsend, R. L. Tracey and G. W. Fisher. The officers are: Thos. Cole, President; Hill Beachy, Vice-President; Frank M. Thayer, Superintendent, and A. Noel, Secretary.

FLOREL SPRINGS WATER Co., OF PIOCHE, NEV.—Oct. 8. Trustees; W. M. Lubbock, S. P. Christy, Jno. H. Wise, Thos. Denigan, Jno. R. Wilson. At the Trustees' meeting, Capt. William M. Lubbock was elected President and General Superintendent, Jno. H. Wise, Vice-President and Thos. Denigan, Secretary.

EUREKA CONSOLIDATED M. Co.—Directors: John W. Shaw, Thomas Bell, George W. Kidd James Findla and W. H. Osgood. The Board organized by the election of John W. Shaw as President and W. W. Traylor as Secretary. The company have paid three dividends of $50,000 each during the year, in May, June and July. On the previous fiscal year four dividends of the same amonnt were paid in June, July, August and September; and during the year 1871 $275,000 was thus paid, making a total of $626,000 in dividends since the opening of the mine.

Mining Accidents.

A men named John Prout, last week hed hie heed ceught hetween the timhere of the shaft, on one of the lower levels of the Kosenth mine, and the aecending cege, and so hadly crushed thet he died instantly.

A man nemed Petrick McEntee, while engaged in retimhering the shaft in the Reymond & Ely mine, hetween the ninth and tenth levels, hy some mishsp slipped and fell down the eheft to the next etetion, a dietance of some fifty odd feet. When he was picked up he was fonnd to he qnite dead.

The Owyhee *Avalanche* states thet on the 10th inet. as a miner nsmed Samuel Bessett was eecending the Illinois Centrel sheft on the hucket the wire hoisting rope hroke when he had almost reeched the surface, letting him fell to the hottom of the shaft, a distance of 240 feet, end killing him inetantly.

A serions accident occurred at the Arizona mine, Unionville, lest Friday evening, eays the Humholdt *Register*, hy which Devid Woolcock had his thigh hone broken, near the hip, and two of hie ribs fractured, end, it is feersd, injured internelly. The accident occnrred on the tremway. It ie the custom to cerry the minere from the foot of the mountein to the mine. On this occesion the car was loeded with miners, and when the car came near the switch where they have to ness the descending cer, some one celled ettention to the fect that the dinner cens were ebont to slide out at the hind part of the cer, the holt which fastene the end gate heving slipped out of plece. Woolcock, who wee riding near the reer end of the cer, hent over to eecure the door, and in doing so etnck ont one leg et elmost right englee with the car, and while in this position the descending cer struck him. Hie thigh bone was hroken short off, and by the force of the hlow he wee hurled to the ground with greet violence, hreeking two ribs hy the fell. He wes hadly hrnised in meny places on the hody, and it is feared seriously injured iuternelly.

A fetel accident occurred on the 28th nltimo et the Garrison mine et Cortez. Several hlasts of gient powder hed heen ehot off in the hottom of e eheft about eixty feet in depth, end a miner named McKenise wee lowered down in the hucket to send np the rock thrown np hy the hleste. Soon efter resching the hottom he called out to those ahove to hoist him ont, es he was getting faint from the fnmes of the powder. When near the top he feinted and fell from the hucket, striking the jegged rocke at the bottom of the sheft, and killing him instently.

On the 5th instant e feerful accident occnrred in the Kossuth mine, cn the Cometock. A men nemed John Pront, who was timhering neer the mein eheft on one of the lower levele, hed hie attention celled, and looking up the shelt while the cege wes aecending, hed hie head cenght hetween the cars and timhere, and wee crushed to death in an inetant.

The platform at the ninth stetion in the Mehogeny mine, Idaho, geve wey lest Wednesday, cansing a miner named Owen Duffy to fall a distence of ehout twelve feet to the hottom of the shaft, hruising the next to the little finger of his left hend eo severely ae to necessitate empntetion et the first joint.

A miner named William Simmone wae laet Monday morning knocked from a pletform in the South Chariot (Ideho) shaft hy e descending hncket, causing him to fell e distance of 50 feet, frecturing hoth lege helow the knee, end receiving such injuries as resulted in hie deeth on Thnredey evening.

Mining Summary.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

California.

AMADOR COUNTY.

The Big Ditch.—*Dispatch*, Oct. 10: The new pipe for repairing the recent break in the Amsdar canal has been placed in position, and the water is now rapidly flowing to the distributing reservoir. Miners who have been waiting for a supply of water from this ditch can now commence preparing to work their claims.

Quicksilver.—Reports from the Amador quicksilver mine continue to be of the most favorable character. It is being developed as rapidly as the means of the stockholders will permit.

Progressino.—Work on the new hoisting works at the Oneida mine is progressing finely, and when completed will be one of the most substantial character.

CALAVERAS COUNTY.

Gwin Mine.—*Chronicle*, Oct. 10: Intelligence from the Gwin mine is of the most encouraging character. The ledge in the 900-ft level has widened out to 22 feet, with the quality of the rock good and improving. Thirty-six stamps are in motion. Our statement last week that the "aggregate yield of the mine is $6,000 per month," was an error. We meant to say "week" instead of "month."

San Bruno.—Everything continues favorable at the San Bruno mine in Mosquito Gulch. Another crushing of rock is mixed, hauled to the mill and the stamps will be set at work upon it next Monday morning. The yield of the San Bruno, since the pay chimney was struck, has been enormous, and there are no indications that the mine will ever "let up."

West Point District.—Levels are being run from the main shaft of the Mina Rica at the depth of 110 feet. The vein is 5 feet wide, 2 feet of No. 1, and three feet of low grade ore. Twenty tons, crushed at Harris' custom mill, yielded $35 per ton of free gold; the low grade will average near $10 per ton.

The Zacatero continues to supply its 10-stamp mill with facility. The stopes above the lower levels demonstrate conclusively that the quantity and quality of the ore gain in depth. Shaft, 300 feet: deepest in the district.

Miller & Co., at Anderson's Flat, have a large, heavy sulphuretted vein at the depth of 100 feet. Ore crushed yielded $15 per ton of free gold.

Haskins & Co., at Big Flat, are sinking on a very large vein, 2 feet thick of which is valued at not less than $100 per ton. Shaft 110 feet deep.

A permanent working shaft has been started on the Woodhouse, on an extensive ore chute which yielded 400 tons of unassorted ore, milling a trifle over $100 per ton in early times.

All the deeper workings in the gold-quartz mines are proving to be profitable investments, beyond expectation, and without a single exception.

COLUSA COUNTY.

The Elgin Mine.—Colusa *Sun*, Oct. 10: We are pleased to announce that the Elgin quicksilver mine is in a prosperous condition, and its fortunate owners are taking out large quantities of the precious metal. On Wednesday they shipped 9 tanks of quicksilver to San Francisco. Our fellow-townsman, E. Chapin, is one of the principal owners in this mine, and we are glad to record the good fortune of that gentleman and those who are associated with him.

FRESNO COUNTY.

Mining Interests.—Fresno *Expositor*, Oct. 7: The mining interests have scarcely been touched. Gold-bearing quartz veins and placer mines exist and will be worked profitably; the railroad enables the better class of our copper ores to reach market at a profit to the miners, and lower freights will make this class of mines a boundless source of wealth; coal and iron, at an early day, will help to swell the mineral wealth of our county, and for years our mountains have produced a large share of the quicksilver thrown on the markets of the world, and yet this class of mining is but in its infancy, as new and valuable cinnabar mines are being frequently found within the limits of Fresno.

INYO COUNTY.

Panamint. — Cor. San Bernardino *Argus*: There is a plentiful supply of water in the cañon. The town is flourishing, and the sounds of the hammer are heard in all directions. We have one store of general merchandise, butcher shop, restaurant, barber shop, two physicians, several lawyers and any number of rum mills. The Surprise Valley Mill and Water Company, of San Francisco, are at work and doing all that can be done with lack of tools. In a few days every man who wants work can get it.

Trails and roads are being built to the mills, grading for mill sites and improvements generally are the order of the day. I have never been in a more lively camp, and a future is predicted that will be second to not even Virginia. The mines look exceedingly well, showing as fine looking ore as is ever seen for such large veins, varying as they do from three feet to thirteen and fourteen feet. The town site is about 5,000 feet above the level of the sea and the mines vary from six to eight thousand feet above the same base. The climate is delightful. Snow does not remain in the valley but a very short time, and is rarely more than twelve inches deep. Lumber is scarce and commands a high price.

LAKE COUNTY.

Our Mines.—Lake County *Bee*, Oct. 8: Our chrome mine, three miles south of town, still yields its ore by the ton, and from present prospects will continue to do so. Quicksilver casts reflections all around us so that our valleys and mountains may in time become stupendous convex and concave mirrors used for astronomical observation in discovering the inhabitants of Mars.

MARIPOSA COUNTY.

Mining on Buckeye.—Mariposa *Gazette*, Oct. 10: Catron & Co. have their mill running and are crushing quartz which promises to yield satisfactorily. The mining is done by Chinamen. Neal & Grahsm are rigging up an engine for pumping and hoisting ore at the shaft of the old Mexican mine, near Catron's, and we may expect to hear favorable reports from them soon.

MONTEREY COUNTY.

Mineral Discoveries.—Monterey *Democrat*, Oct. 10: There is quite a *furore* about discoveries of mines, of gold, silver and quicksilver in the mountains east and west of the Salinas valley. The druggist, over at Monterey, is continually called upon to test rocks which in the estimation of those bringing them promise untold fortune, and from the region about Soledad come reports of valuable leads of silver ore. As a supplement to these last, it is positively stated that there is an asphaltum spring about ten miles from the Mission. Since writing the above, we hear that magnetic iron ore of fine quality has been found recently in the hills east of Chualar, specimens sent to Santa Clara for assay having received there strong commendation.

NAPA COUNTY.

Items.—*Free Press:* A recent assay of quartz from the Bonrbon Silver mine reached $560 to the ton. The mine is located on Mt. St. Helens, near the Calistoga Silver mine, and is the property of Foss & Connelly.

Ore is being taken from three levels on the Calistoga Silver mine, at the rate of about fifty tons a day. Over a thousand tons of ore is piled up ready for milling this winter. The mill runs night and day.

NEVADA COUNTY.

Columbia Hill.—*Transcript*, Oct. 10: We learn that the Eureka Lake Water and Mining Company are going to put seventy-five or a hundred men at work on mining ground owned by them at Columbia Hill, the coming winter.

The Union gravel mining company at Kennebec Hill have stopped operations for want of water. They have commenced cleaning up their sluices and will complete their work in a few more days.

The ditch of the Milton Company to Moore's Flat is being rapidly constructed. They expect to have water through it by the first of December. The miners at Moore's Flat are waiting anxiously for the completion of this ditch, and so are the people of the Flats generally.

The North Bloomfield Gravel Mining Company are bringing their extensive and magnificent works to a rapid completion. All the connections are made in their tunnel, except two, and these will be made in a few days more. The company has commenced placing sluices in that portion of the tunnel which has been completed. They expect to be ready for washing through their tunnel by the first day of December.

New York Hill Mine.—G. V. *Union*, Oct. 11: We yesterday saw at Findley's bank a splendid specimen of quartz which had just been taken out of the further end of the New York Hill tunnel. The specimen shows the free gold in plentiful quantities and fine and heavy sulphurets. The character of the rock itself, independent of its show of metal, is what the miners call fine and lively. The New York Hill is developing a splendid ledge.

SONOMA COUNTY.

Items.—Sonoma *Democrat*, Oct. 10: The splendid furnace of the Rattlesnake mine commenced burning adobes this week. These adobes are filled with free metal.

The Annie Belcher has a good showing of metal on the dump and more in sight. A 20 ton furnace is in course of construction.

The road from the Georgia mine to Pine Flat is complete. There is 100 tons of ore on the dump at this mine.

Guerneville.—The thirteen-ton furnace for the Mount Jackson is just done, and is pronounced by those who have seen it as the best in the county. In the lower tunnel the foot wall of the ledge has been struck; at a depth of 210 feet they cut through 15 feet of pay rock. Ten thousand dollars has been expended so far. From this time it is thought that the mine will pay its way. The company have 25 white men at work.

The Great Eastern has been leased to Tiburcio Parrott and others for six years. The owners of the mine to have one flask out of every four taken out.

SAN BERNARDINO COUNTY.

Gold Mt. Co.—San Bernardino *Argus*, Oct. 5: The Gold Mountain M. Co., at Bear Valley, have been working quietly and steadily. We saw to-day the hills of lading for the first shipment of material for the construction of a first-class 40-stamp mill. When the mill is completed we will have not only the largest mill south of San Francisco, but the largest ledge in the State.

The Snow Storm.—This mine is in Oro District. From a report on the mine by J. W. Young, Jr., we learn that the ledge crops out boldly over 2,000 feet, the greatest extent of the vein not visible being less than 50 feet. The width of the ledge averages about five feet; the narrowest portion measuring three feet. The quartz is gold bearing, as the percentage of silver it carries is very small. From a general average of rock taken from the present workings the ore will mill by ordinary amalgamation $34.50. A great portion of the ore shows free gold.

TRINITY COUNTY.

Extensive Preparations.—Trinity *Journal*, Oct. 10: The Union Hill company have 500 feet of tunnel to run before any more washing is done, and they have gone to work at it with the intention of completing it as soon as possible. Three shifts are now being worked in the tunnel and shaft—8 hours on and 16 off. The shaft is being sunk on the line of the tunnel and when down to the proper level, the tunnel will be pushed ahead from it. A new 40-inch flume will also be put in.

From Cinnabar.—Mr. Fred. Loring, of Trinity Center, was in town and informs us that Cinnabar District is flourishing. Hawkett & Lytle have put up four new retorts, and Warland & Co. have also placed four in position.

TULARE COUNTY.

Mineral King Mines.—Visalia *Delta*, Oct. 8: Wiley Watson came to town a few days since from the Mineral King mines. He brought with him a ton of ore from the McGinnis lead, to be sent to San Francisco for assay. An average of six assays heretofore made of this lode shows $48 per ton in silver. Creighton, who paid $1,500 for a claim on the Lady Franklin, has suspended work for the season. This claim is on very high ground. Ford & Belden are making rapid progress with their tunnel, and expect to reach the lead this fall. The owners of the Red Comanche claim have made an arrangement with Mr. Whitcomb, of San Francisco, to sell the claim of 1,500 feet for $20,000, the money to be paid this month. An assay from the Annie Fox shows gold, $6.48, and silver, $43.38 per ton. The Lady Franklin company have drifted along the lead some thirty feet, and have taken out some forty or fifty tons of ore. What is needed in these mines, before any progress can be made, is the completion of a good wagon road.

TUOLUMNE COUNTY.

A Good Mine.—*Independent*, Oct. 10: The Old Tuolumne company will put up a large, first-class mill on their mine. This claim, about 2½ miles north of Columbia, will yet prove one of the finest in the county. The vein is four feet wide in the shaft, shows free gold all through, and will go $100 to the ton. They have also a sulphuret vein 6 feet wide, 12 feet from the above, 25 per cent. of which is sulphurets, which assay from $100 to $2,000 to the ton.

New Mill at Soulsby Mine.—Workmen have arrived from San Francisco, as also the machinery, for to put into operation on the Soulsby mine a 10-stamp mill—full Howe's mortars, weighing from thirty-five to forty hundred.

That $250 Chunk.—Chas. Wagner and Ludwig Schwartz were the lucky ones who picked up the nugget weighing fifteen ounces, in Columbia, on Friday of last week. They had just commenced working on the old claim on the northwest corner of the Northup ranch, when they were struck with this streak of good luck. The piece was nearly all gold and is worth about $250. The claim had not been worked for many years.

The Patterson mine employs right along from 35 to 40 men; and as they get down and open out many more will be needed. Our business men can see from this, the importance of having our quartz mines opened.

Nevada.

WASHOE DISTRICT.

Consolidated Virginia.—Gold Hill *News*, Oct. 8: Daily yield, 300 tons of ore, mostly extracted from the 1,200, 1,300 and 1,400 ft. levels. The ore breasts on the 1,200 and 1,300-ft. levels are being continued both north and south, still in rich ore. The ore stopes on the 1,400-ft. levels are being continued both north and south, still in rich ore. The ore stopes on the 1,400-ft. level are opening out richer and more extensive every day. At the point where the ledge was first opened on this level it has been cross-cut to the east clay wall, showing the ore vein to be 89 ft. in width, with 78 ft. of rich milling ore. The new mill is steadily approaching completion and will probably be in running order in about 60 days.

Sierra Nevada.—A heavy flow of water has again been struck in the bottom of the new shaft, but which is handled by the pump with the most satisfactory ease. A new and what promises to be a favorable ore development, was made during the past week in a north drift run from the old Sierra Nevada tunnel. This drift was started at a point about 650 ft. from the month of the tunnel, and had been run but a few ft. when a whitish quartz and ore was struck, assaying largely in gold. The drift has been run 14 ft. in this body of ore, which still continues in the face, and an upraise has just been commenced to ascertain the extent of the ore in an upward direction. The mill is kept steadily running on ore from the mine. Daily yield 65 tons of ore.

Woodville.—The north drift on the 300-ft. level, two days ago, encountered an entirely new body of fine ore, which promised to develop into a much larger body than any heretofore discovered. This is a very important discovery, as it is the farthest point to the northward that has been reached, and demonstrates the extension of the ore body in that direction. Stoping out on the ore body between the 200 and 300-ft. levels has been commenced. Daily yield 25 tons of ore.

Ophir.—The ore stopes on both the 1,300 and 1,465-ft. levels are still yielding the usual quantity of ore, which amount can be greatly increased whenever it is desirable to do so. The yield of the Empire State mill for 26 days' run during September was $51,000. Land's mill in seven-mile cañon, was started up on ore from the mine yesterday. The addition of this mill will more than double the yield of bullion over last month.

Imperial-Empire.—The main south drift on the 1,850-ft. level is still driven vigorously ahead, the face in fine ore. The vertical north winze on the same level mentioned in our previous reports, as being started to connect with the old incline north winze, has just reached the ore body, which is of a rich character; this drift will, in a short time, connect with the incline winze.

California.—The north drift on the 1,400-ft. level from the Consolidated Virginia shaft, will connect with the south drift from the Ophir in a day or two more, insuring a perfect ventilation of the mine to that depth.

American Flat. — Cross-cuts have been started from the south drift on the 750-ft. level to cut and prospect the ore vein, and some good results may be looked for.

Crown Point.—Daily yield 500 tons of ore. All the ore breasts on all the different levels from the 900 down to the 1,500-ft. level are looking well and yielding the usual quantity of good ore. The pump has been lowered from the 1,500 to the 1,600-ft. level, ready to drain the water when necessary. The mills are all running, although those on the river cannot yet work up to their full capacity for want of the necessary supply of water. To remedy the falling in the amount of ore crushed, the company have secured the Dangiss and Golden Gate mills, with a crushing capacity of 60 tons, both of which are now being run on ore from the mine.

Belcher.—Daily yield 500 tons of ore from all the different levels from the 900 down to the 1,400-ft. level. The ore breasts on all the levels are looking well and yielding finely. The new air shaft is finished down to the 1,000-ft. level, from which point it will be inclined to the 1,500 ft. level. It is operating finely, completely cooling the mine down as far as it is finished.

Gould & Curry.—A large body of quartz has been developed by the cross-cuts in the ledge, at the fourth station level, but no ore that will pay the cost of extraction and reduction.

Hale & Norcross.—The main south drift on the 2,000-ft. level has reached the south incline without developing any paying bodies of ore.

Rock Island.—The main west drift at the first station level, is in a distance of 545 ft. the last 8 or 10 ft. being run through the hard, tough clay forming the east wall of the ledge.

Occidental.—The upraise from the level of the lower tunnel is making good progress, the face still in ore.

Genesee No. 2.—The sinking is progressing very favorably, with some fine quartz indications in the bottom of the shaft.

East Belcher.—Sinking the fine three-compartment shaft is progressing at the rate of 2 feet per day.

Original Gold Hill.—The indications for a good ore deposit are better and better as the drifts advance.

Savage.—Cross-cutting and prospecting on the 2000-ft. level is still vigorously prosecuted, with some favorable indications.

Dayton.—The ore breasts on both the second and third station levels are yielding the usual amount of fine milling ore. The mill is kept steadily running on ore from the mine.

Julia.—The stone work for the foundation of the new pumping engine, is nearly completed. The new pump bob is being put in position. The water is now drained to the 1000-ft. level and cross-cutting on that level will be resumed in a very few days.

Chollar-Potosi.—The body of ore found in the Belvidere section has been drifted upon north and south, and cross-cut both east and west, until its limits have been reached. Daily yield 75 tons of ore.

Baltimore Con.—A cross-cut has been started on the 450-ft. level, which will reach the ore vein in a very short time. A cross-cut has also been commenced from the north drift on the 750-ft. level, which will reach the ore vein in five or six days.

Yellow Jacket.—The east drift made connection with the south winze on Sunday last giving a fine circulation of air on the 1740-ft. level. Drifts will be immediately started north, south and east, to prospect the ore vein.

Bullion.—The main north drift from the 1700-ft. station is still following the west wall at the ledge which is well defined, cutting occasionally, on the side next to the ledge, fine bunches of quartz and streaks of ore.

Mint.—The shaft is down 340 feet, the bottom in soft sinking ground. Streaks of quartz and low grade ore are frequently encountered, giving great encouragement in the prosecution of the work.

Sutro.—The main west tunnel is still driven ahead with all the force and energy possible, the ground in the face is working quite soft, and excellent progress made.

Sutro Tunnel.—Total length from the mouth to the face of the main header, 7,081 feet. The ground now met with is hard, but

[Continued on Page 252.]

Plates for Testing Seeds.

In a recent number of the PRESS we published a request for information on the subject of testing seeds; asking our friends to send us suggestions or descriptions of methods whereby this desirable object might be attained. In compliance with this request, Mr. E. C. W. McDonald sends us a description of plates for testing seeds, engravings of which we have caused to be executed and herewith given for the benefit of our readers. These plates will probably prove satisfactory in what is claimed for them, namely to test the germinating power of seeds; and in this respect they will be useful to the seedsman in ascertaining the value of what he is selling or buying. Interesting experiments may also be performed with their use by the botanist; but, as an adjunct to this, we need some method by which we may ascertain the age of such seeds as are injured by age. To expect an accurate test, of general application, would be asking too much of the present state of knowledge on the subject; but there are some seeds, which, by their external appearance, or on an internal examination, betray evidence of age. These simple rules may be made available to some extent; and we would like to have any of our friends, where observations have developed any rules on whose they can rely, furnish us with such information, no matter to how limited a class of seeds their observations may have been confined. Meanwhile we may be allowed to hope that science will in time furnish some means by which we can ascertain the age of seeds.

We give below the accompanying note, with the address of the gentleman who kindly furnished the information in regard to these plates, following which is a description of their construction and method of using, copied from the circular of Krelage & Son, Haarlem, Holland:

EDITORS PRESS:—After reading your editorial about seed tests in a late number of the RURAL PRESS, I at once thought that by sending you the description of these plates, manufactured by my friend Mr. Krelage, I should comply with your request for information on this important subject.

I have two plates in my possession, one for small and one for large seeds, and am willing to send them to you for inspection. I admit that these plates do not give all the information you ask, but they are without doubt of practical use, and deserve to be introduced in this country as well as in Holland or England, where they are in use. With the assurance that I will gladly give you any further information on this point if you may want it.

I remain respectfully yours,

E. C. W. MCDONALD.

"These plates are manufactured of fine potters' clay. The figure here given conveys an exact idea of their construction. The numbered holes are destinated to be filled with an equal number of sorts of seeds. E. H. Krelage & Son have convinced themselves, by repeated essays, of the excellency in every respect of these plates, and are happy to say that the most competent authorities agree with them on this point. For this reason E. H. Krelage and Son have thought it convenient to have manufactured these plates on a more large scale, in order to be able to offer them at a price acceptable to every one.

Use.

The plate is laid during 24 hours in water, before it is used; then it is placed in a table-plate and water is turned on the table-plate, as much as to fill the space between the edge of this and the testing-plate, taking care not to cover it with water. Then in every one of the holes one of the seed sorts is laid, of which the germinating power is to be examined. Seeds which germinate difficultly or slow, like grass seeds, etc., are covered with a little earth; this is not necessary for seeds germinating quickly, such as cabbage, etc. There must be taken care to turn fresh water on the table-plate daily in order to have the space between the edge of this and the testing-plate always filled with water. To advance the germination of the seeds it may be well to cover the table-plate with the testing-plate by a bell-glass; this, however, is not absolutely necessary. It is clear that an elevated temperature of the room where the operation takes place, equally promotes the germination. Sometimes it may happen that the testing-plates begin to grow mouldy; in such cases they ought to be washed clean, and then heated glowing; thereby every vestige of mould will be destroyed.

Sorts.

There are two sorts of testing-plates: testing-plates with 24 numbered holes (No. 1—24), as figured here above, for testing small or medium-sized seeds; and plates with 5 numbered holes, (No. 1—5), for testing large seeds, like beans, peas, mangold-wurtzel, etc. The use of both is the same.

Utility.

It needs no demonstration to prove that in many cases it is useful, in some a necessity, to test the germinating power of the seeds. At an expense of a few shillings the seedsman may on a spot of one square metre test at once nearly one thousand sorts of seeds. Besides there is easily found a place in every seedshop to place a plank with testing-plates. The agriculturist and every possessor of seeds may by these testing-plates control in a simple manner the vitality of the seeds he buys or which he wishes to sell. Besides the testing-plates may be of use to study the germinating process of the seeds, for schools, botanists or lovers of nature in general.

Exposition.

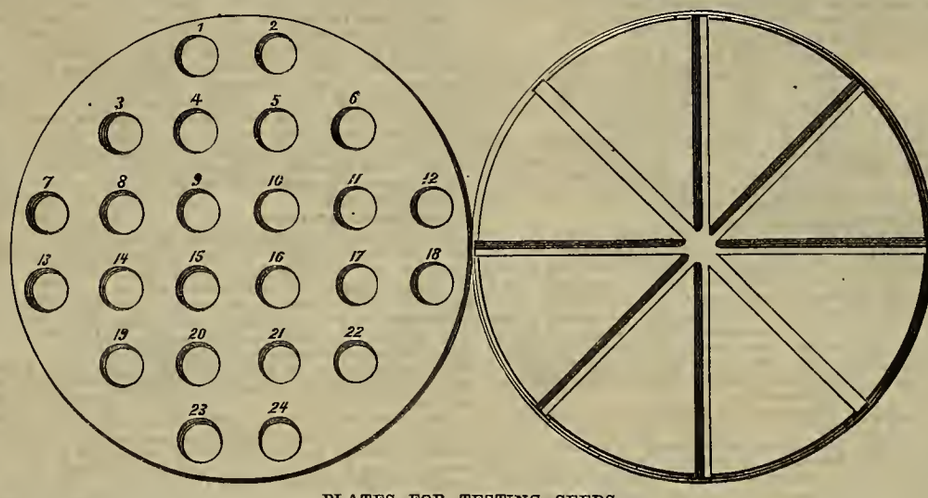
The testing-plates have caused much interest at the shows in 1870 at Amsterdam and Arnhem, and in 1871 at those of Haarlem, Amsterdam, the Hague and Hoorn. At the last named show a premium was awarded them. The testing-plates have been exhibited at Carlsruhe, at the permanent show of agricultural education-materials, on request of the committee.

The principal Dutch and German Agricultural Journals have treated on the great advantage of these testing-plates."—*Rural Press.*

United States Mints.

The following interesting extracts from the annual report of the Director of the Mint has been furnished for publication: The gold deposits were $68,961,591, and silver deposits and purchases $15,122,151; after making proper deductions, etc., the deposits of gold were $64,219,142, and silver, $11,435,678. During the fiscal year there were transmitted from the New York Assay Office to the Philadelphia Mint, for coinage, gold, $18,704,101, and silver, $2,613,636; total, $21,317,737. Compared with the previous year there was an increase of

Top-side. Bottom-side.



PLATES FOR TESTING SEEDS.

$8,924,165 in the amount of gold operated upon, and of $2,084,761 in silver received and operated on, $1,219,352 in gold coinage, $3,037,805 in silver coinage, $10,815,086 in bars, prepared at the assay office. A comparison is made of operations for the last fiscal year, with an average result for the 10 years, ending June 30th, 1872, showing the following per cent.: Increase in gold bars operated upon, about 115 per cent.; silver operated upon, about 397 per cent.; gold coinage, 121; silver coinage, 369; fine gold bars, 226; imported gold bars, 340; fine silver bars, 619, and imported silver bars, 60. The loss by abrasion is shown to have been but little over ½ of 1 per cent., and much less than usual. The renovating of gold coins is now about complete as to those in circulation in the Pacific States and Territories. The Director recommends their withdrawal before a return to specie payment, as after such resumption such coins will naturally find their way East and enter into circulation. The opinion is expressed that the reduction of weight of coins for fraudulent purposes has not been carried to any extent in this country.

The Director says whenever the specie basis shall have been reached, a large coinage of smaller denomination of gold coin, half and quarter-eagles, will be necessary, but the Mints can manufacture the same as rapidly as would be required, or bullion could be supplied for the purpose.

There are now six denominations of gold coin, which is a greater variety than is required. This being the case and the three-dollar piece corresponding so nearly as to weight, value and size with the quarter eagle, and rarely used, its coinage should be discontinued.

The coinage of trade dollars during the fiscal year amounted to $3,588,900, a greater portion of which was exported to China, where they found a ready market for trade and exchange purposes. Owing to the limited capacity of the mints on the Pacific coast, the department has not been able to meet the demands for these coins. The increased capacity of the new mint in San Francisco, to which operations will soon be transferred, and the addition of new machinery and appliances at the Carson City mint, will enable the department to meet the demand for a 1 coin, both gold and silver, which may be required on that coast for circulation and export. In reply to the question frequently asked of the department as to why the supply of five cent silver coins was discontinued, the director says the reason appears to have been that it would on the resumption of specie payment be likely to expel from circulation and send to the Treasury for redemption the five-cent nickel coins, having been issued to the extent of over $500,000, and the amount being sufficient for a token coin of that denomination, the provisions of the law discontinued five-cent silver coin. Referring to the coursa of silver bullion, the director shows that the Government can at any time, unless there should be a material advance in silver and reduction in gold value of paper dollar, supply itself with such an amount of subsidiary silver coin as it may require, to pay out at its nominal value, at about the same terms as the corresponding sum in paper currency could be obtained by the sale of gold coin. The demand for the coins appear to come from Texas and the Pacific coast, where they circulate as money. The first effect of any considerable issue of subsidiary silver coin would be the disappearance in the New York market of the difference between bullion and the market value of coins; they would be sent to the Pacific coast and Texas in such amounts to compel merchants to avail themselves of the provisions limiting legal tender of such coins to five dollars. After a time they would begin to enter more or less into general circulation in other sections of the United States, and as paper money approached parity with gold, will gradually extend to fractional notes. The latter being redeemable in United States legal tender notes will, of course, become as to subsidiary silver the superior currency. Whenever the legal tendar notes become exchangable at par for gold, they would even become superior currency as to silver coin before greenbacks had actually reached parity with gold.

The provisions of the coinage law, which authorizes the amount in silver coins for silver bullion purchased for coinage by the Mint at Philadelphia and the Assay office in New York, expire, by its own limitation, on February 12th, next, after which subsidiary coins can be procured from mints only in exchange for gold coins at par. This provision of the law should not be re-enacted or extended; the issue of subsidiary and token coins should be entirely under the control of the Government, and kept within such limits as will protect the public from the inconvenience and loss which would attend a redundant issue; when subsidiary or over-valued silver-coins of any description are issued, two things are of vital importance, and should be observed. First, a proper limitation as to the amount for which they are to be a legal tender. Second, the amount of issue limited to the requirements of the public for change. The latter is the only purpose for which such coins are designed to be used, and this can be effectually attained by their issue only in exchange at par for coin of standard metal in this country. The restriction as to the mode of issue applied particularly to the time when gold, and not notes, was based upon the debt as shall not form the basis of currency. Before we reach that basis, however, the Government may, under favorable circumstances, pay out coins at their pleasure and convenience, to the extent required to meet any legitimate demands for the same.

The amount of specie in this country is said to have been on the 30th of June last $116,000,000. The estimates show a gain in specie and bullion during the last two years of $38,500,000. The amount of gold and silver coin and bullion in the world is estimated at from $10,000,000,000 to $12,000,000,000.

RIGHTEOUS LAW.—In the French penal code it is provided that any person or persons who shall combine to raise or depress the price of articles of food above or below what it would be in the natural state of trade at the time, shall suffer two months' imprisonment and pay a fine of not less that $200 nor more than $400.

ORNAMENTING WOOD.—Wood can be ornamented by punching down carefully in patterns, planing off a little, and then wetting; the parts punched down show in relief above the planed surface and make quite a puzzle.

The Eucalyptus and Its Mission.

Those who have claimed for the eucalyptus remarkable anti-malarial influences, will be pleased to hear a reliable report of its proved efficiency in this respect in our own State. Some items have been circulated through the press of this country, declaring that the eucalyptus at home, in Australia, is not credited with the possession of the properties which have been claimed for it by its friends in this country; and many who do not go so far as to make this sweeping denial, are still inclined to treat the current reports of its anti-malarial influences as exaggerations. So that we might very naturally look for a reaction of the enthusiasm for planting this tree here. But to counteract these discouraging influences we are receiving fresh assurances of its efficacy. French scientists claim that in Algeria malignant fevers have disappeared from districts where the eucalyptus tree has been extensively planted. An essence similar to camphor has been extracted from its leaves by a French chemist, to which he gives the name of "eucalyptol," and which, he states, exercises upon the human system the same beneficent effects as other essential oils. In the island of Mauritius the leaves of the eucalyptus are used as an antidote to malarial fever.

Later accounts from Australia confirm those of an earlier date, in regard to its healthful influence. A Melbourne chemist makes the dried leaves of the eucalyptus into cigars, the smoking of which is declared to be highly beneficial in bronchial and pulmonary complaints. It is also claimed that it has been the means of introducing the honey bee into Australia. When the English began to colonize Australia, there were no honey bees there, so it is said, and the swarms that were introduced there and turned into the forests where the eucalyptus tree greatly predominated, at once commenced honey making; and it is now demonstrated that the flowers of this tree are very productive of honey.

But the most satisfactory accounts from the eucalyptus tree are those that come from nearer home. We find in the Kern County *Courier* an endorsement of claims of this tree, which we copy, being confident that it will inspire confidence in what we have on former occasions said on this subject. The editor of the *Courier* derives his information from personal observation; he being the owner of a farm upon which the matter was tested. He states his observations and experiences as follows:

"We speak somewhat positively in regard to the sanative or anti-malarial influence of the eucalyptus. If all, or even part of the evidence we have read on the subject coming from sources entitled to the utmost confidence, is true, we are certainly justified in so doing. But we are not accustomed to speak positively or to say in effect we know, unless we have the evidence of our own observation or personal experience. In regard to the anti-malarial influence of the encalyptus, we have this conclusive evidence. We have given it what we regard as a reasonably fair test on our own farm. This is cultivated by two families or companies of Chinese. One company lives near the north and the other the south end of the premises, about three-fourths of a mile apart. The localities both parties inhabit are favorable to the development of malaria. The soil is rich, moist, and teeming with vegetable life, and the free sweep of the prevailing wind is obstructed by the intervention of dense thickets. As might be expected, they have, every year, during the heated term, suffered with malarial fever. Last winter we determined to test the much vaunted virtues of the eucalyptus. In February we gave to the party at the north end two ounces of the seed, with directions that it should be planted near the house. It germinated finely and produced several thousands of young plants, but the frost killed most of them. About twelve hundred, however, survived. These, when the heated term commenced, had attained an average height of two feet, and emitted a strong aromatic or camphorous odor perceptible at a distance of a hundred yards. In due time the party at the south end were visited by their usual mildly-distressing fever, but up to the present time we have looked in vain for the first symptoms to develop in the other. They are all, to their own astonishment, in the most robust health. These trees now average more than three feet in height, and the atmosphere of the house is strongly impregnated with their odor. We have investigated in vain for other causes to which to attribute the anomalous state of health of the inmates and can find none but the reputed sanative properties of this tree. We have finally become convinced from the evidence of our own senses that it will do all the current accounts given of it allege, and propose, the coming season, to plant it on all the waste places and corners on our farm we can spare from other purposes. If everybody would do likewise the great valley of Kern county might soon take rank among the sanitariums of the State, because as yet no disease except a mild type of malarial fever has shown itself. Every land-owner, be his possessions large or small, should put it in the light of a duty to plant more or less of encalipti.

Good Health.

Indian Meal as a Vehicle for Heat.

The application of heat to the body as a remedy is very common. Wringing out cloths in hot water, infusions of hops or other plants, and placing them upon the part affected is probably the plan most frequently pursued. This practice is objectionable, because it needs close care to prevent wetting and chilling when cool, and also to be so frequently renewed and re-applied to keep up the due amount of heat. If jugs or bottles of water are employed they are liable to become broken or uncorked, or to leak and deluge the bed. Besides, when water is used as a vehicle for heat it causes moisture, which is undesirable, particularly as it is a good conductor of heat. If sand or sugar is employed the weight is objectionable. In looking about the resources of an ordinary household for a substitute I was led to select Indian meal, as it is generally on hand in the larder; it is of light weight, not unpleasant in odor, and particularly because it holds heat for a long time. This latter fact I noticed when a mere boy, finding that corn meal would, after grinding, bear several miles' transportation, and after delivery and deposition in the bins of the granary would for hours still be warm from the friction of grinding.

When, therefore, it is desired to apply dry heat to any person it is only required to place a quantity of the Indian meal in a baking-pan on a heated stove, and stir constantly till thoroughly warmed. It should not be burnt. It can now be put into woolen sacks and tied up and applied as a hot bottle usually is; or into large flannel bags if for the abdomen. In a case of successful resuscitation of a new-born child, the heated meal was poured into an oblong chopping-tray and a flannel cloth laid over it and the infant in it. The cloth yielded, and the child was partly buried in the warm meal. It is found that the meal retains its heat long, and when it cools it does not chill, which is a very important consideration. Two sets of bags or wrappers may be provided, so that while one is being applied the other may be heated. The meal is not weighty. The aroma of it when heated is rather agreeable than otherwise. It is now my favorite vehicle for applying heat.—*Cor. Herald of Health.*

Artificial Feeding of Children.—Nursing by the mother is the only natural feeding, and it cannot be substituted by any other with safety to the health of either the mother or the child. Wet nursing is only to be resorted to when the mother's milk is not suitable, and a proper wet nurse can be obtained. The so-called "prepared foods" with their flaming advertisements and testimonials, oftentimes spurious, and accompanied as in one instance, by the picture of a wonderful baby "brought up on this and no other food"—all of these originate in a desire to meet the wants of children deprived of mother's milk, and often stand in the way of a mother's duty of nursing. The country is flooded with them. Some are harmless, many dangerous and a few useful. The thoughtless endorsement of physicians is sadly deplored. A perfect substitute for mother's milk has not yet been made, and it is doubtful whether it will ever be. An exact analogy in solid and fluid constituents cannot take the place of human milk, with its inherent, unexplainable, life-giving principle.—*Sanitarian.*

Hay Fever.—From the best statistics that can at present be collected, there appears to be over fifty thousand persons in the United States who are annually subjected to this distressing complaint. In the opinion of the most intelligent physicians, it is to be classed among the nervous diseases, such as neuralgia, rheumatism, etc. An effort is being made in medical circles to obtain particulars from sufferers, and thus promote the study of proper remedies. For this purpose, Dr. George M. Beard, of New York city, has prepared a printed series of questions for answers by patients, the results of which are expected to be of value. All who are troubled with hay fever, and all who are personally familiar with the disease should send for this series and supply such information as they can.

Sleep in the Olden Time.—There are yet to be met with, in some old castles, monstrous old fashioned bedsteads, in which formerly whole families used to sleep together. This custom dates itself to the times of chivalry. These valiant souls who were accustomed in the field to share the same tent, bed and table, were also admitted to share winter quarters in each other's castles with the same cordiality. And then there might be seen, sleeping in one and the same bed, the master of the castle, his spouse and children, the knights his guests, and along with the rest sometimes the favorite dog. Admiral Bonnivet used to sleep with Francis I., who called him his knight companion.

Transfusion of Lamb's Blood.—Interesting experiments have recently been made at Cincinnati in the transfusion of lamb's blood into human blood, particularly in cases of chronic anæmia. Dr. Settle, under the direction of Dr. Dawson, has made several trials at the Good Samaritan hospital. In one instance he transferred eight ounces of blood from the neck of a living lamb to the veins of a man's arm, the connection being made by means of a silver tube in the man's arm, glass in the lamb, with a rubber tube between.

What is Hydrophobia?

Dr. Hammond, an eminent surgeon, has made a discovery touching hydrophobia of great interest. A number of extraordinary cases have occurred recently in New York. A man was bitten by a dog which appeared to be in good health—showing no symptoms of the rabies. But the man died, having all the symptoms of hydrophobia. This is by no means an isolated case. Dr. Hammond resolves the conclusion that the bite of a dog may be fatal while the dog has no discernible symptoms of hydrophobia. The dog may live, while the man may die. If this is a correct conclusion, then the bite of a dog, under any circumstances, is very dangerous. For, however healthy the dog, it cannot be known that hydrophobia will not follow. People who have a horror of the bite of even the smallest dog, though it be a household pet, have certainly good ground for this dread.

It has also been found that hydrophobia is a disease of the nerves and brain rather than a disease of the blood. This theory being true, many of the remedies heretofore applied are worse than useless. The nerve centers are first affected, then the brain. There is some ground for believing that persons are sometimes victims of hydrophobia who have never been bitten by any dog or by any other animal. There are cases on record which support this view. When some of these cases have resulted in madness it has been referred to an old bite occurring 20 years before. It would seem possible that a madness at least analogous to hydrophobia might result from the imagination, the same symptoms being manifest and the same results following.

The statistics of death from hydrophobia show that 63 deaths occurred in the United States during the last ten years. Of these cases nine occurred in New York, nine in Pennsylvania, and 22 in Louisiana, while no well-authenticated case is recorded in California, although there have been reports from time to time of the destruction of rabid dogs. The theory that this terrible disease prevails to a greater extent in hot weather is partially borne out by the facts. Louisiana has a very hot climate, and a large number of rabid dogs. But it is equally hot in Texas, where only two cases of the rabies were recorded in ten years.

Useful Information.

Restoration of Oil-Paintings.

Oil-paintings are made, we know, with siccative linseed-oil colors, and when dry covered with a thin resinous varnish. Aside from the incurable darkening by age, they are subject in the course of time to two diseases conditioned by the oil employed, and which are capable of improvement. By too hard drying the paint contracts, and covers the picture with numerous cracks, which can be rendered invisible by tediously filling them up with fresh paint. Besides this, it also happens that the film of varnish, which was originally strong and transparent, is transversed by innumerable fine cracks, which render the picture indistinct. Prof. Pettenkofer, of Munich, was the first to devise a simple method to render the varnish transparent again. He placed the picture, painted side down, on a vessel containing absolute alcohol. The ascending vapors condensed on the surface of the picture, and rendered the varnish to a slight degree soluble, so that the parts flowed together and the flaws disappeared. The operation was somewhat inconvenient, since it was impossible to watch the operation directly, and the picture had to be frequently turned over to ascertain the point at which the restoration seems complete.

Eimerling, of Augsburg, conducted warm alcoholic vapors directly upon the picture; this action is frequently too strong, and may injure the paint.

The writer has devised a third method, which does not act so violently as the above, yet, like that, permits its direct observation, and can be conducted just as far as desired.

A vessel filled with alcohol is gently warmed, and air is blown through it with a bellows or other contrivance. The air is impregnated with alcoholic vapor, and is conducted through a tube directly upon the picture. In this way much less alcohol is brought upon the picture than in the preceding method, and the results are excellent.—*Dr. Weigelt.*

Preserving Specimen Insects.—M. Anzoux states, for the benefit of those who are engaged in collecting insects, that he has discovered a new method of rapidly killing and preserving for a considerable period without harm specimens collected in expeditions. He recommended a few drops of essence of bitter almonds to be placed in some sawdust, which should itself be enclosed in a flask hermetically sealed. M. Anzoux has received from the Isle of Ceylon flasks thus prepared containing insects still so flexible as to permit of their being prepared and mounted, though they had been collected at Point-de-Galle some months previously.

To Make Waterproof Paper.—A nice waterproof paper, transparent and impervious to grease, is obtained by soaking good paper in an aqueous solution of shellac in borax. It resembles parchment paper in some respects. If the aqueous solution is colored with aniline colors, very handsome paper for artificial flowers is procured.

Punching Holes in Straps.

The punching of holes through the various straps of harness, for buckle-tongues, and for attaching the buckles, is a matter of considerable importance, and does not, as a rule, receive the attention that it should. The old method, of punching them from the upper or grain side of the leather, has been generally abandoned by the manufacturers of fine work, it being deemed injurious to the wear of the leather. The principal objection arises from the liability of the grain of the latter to crack from the strain of the buckle-tongue, and to be the cause, eventually, of the leather tearing, as it causes such a crease where the tongue catches, that it injures the texture of the leather, and makes it tear the hole more or less. In addition to this, if the leather is very strong, the tongue of the buckle is sure to bend out of shape. All these objections can be obviated by punching from the under or flesh side of the strap, and by using a punch, the long sides being parallel with the length of the strap; the punch should be set at an angle of about 20 degrees, cutting the hole at such an angle that the buckle-tongue will rest in it without throwing any strain on the inside of the leather.

Some object to punching the hole from the under side on account of its forcing the grain out, and thus disfiguring the outside edges of the hole. This can be corrected however by driving the punch through the hole from the outside, which will cut away the slightly turned edge of the grain, and set it down smooth and clean. It is not necessary, however, to repunch any holes except those that will be exposed when the harness is complete. Punches should be as thin as possible, as the extra thickness of the metal strains the leather.—*Harness Journal.*

Improvement in Tanning.

M. B. Picard reports a new system of tanning skins which is carried through without acid and in a much shorter time than is required by the ordinary processes. He first boils the tan down in water, making a complete extract, and then frees the decoction by decantation from all residuss and foreign substances. The strength of the essence thus obtained is regulated according to the quality, thickness, etc., of the hides to be treated, weakening it when necessary with pure water. It is placed in the pits in a cold state, and the skin is immediately thrown in. The latter are lifted and their positions changed three times during both the first and second days, twice during the third, and once a day afterwards. Ordinarily eight days suffices to complete the operation, and the inventor states that the proportion of about 77 pounds of extract to 220 pounds of skins gives excellent results.

The following method is recommended for private use in skin tanning: take equal parts salt, alum, and Glauber's salt, and half a part saltpetre; pulverize and mix. Handle the skins and rub the mixture in well three or four times a day, the oftener the better. If there is not sufficient moisture in the skin to dissolve the salts, put a little water into the latter. We are assured that no moth will attack furs the pelts of which have been thus prepared.

Useful Rules.

To find the circumference of a circle or of a pulley—Multiply the diameter by 3.1416, or as 7 is to 22, so is the diameter to the circumference.

To compute the area of a circle—Multiply the circumference by one-quarter of the diameter; or multiply the square of the diameter by .7854; or multiply the square of the circumference by .07958; or multiply half the circumference by half the diameter; or multiply the square of half the diameter by 3.1416.

To compute the diameter of a toothed wheel—Multiply the number of teeth by the true pitch, and the product by .3184. These results give only the diameter between the pitch line on one side and the same line on the other side, and not the entire diameter from point to point of teeth on opposite sides.

Egyptian Blue.—A remarkable and very beautiful shade of blue is noticeable upon many of the ancient ornaments found in the tombs of Egypt. Analysis some time since proved the color to be formed by a combination of soda, sand and lime, with certain proportions of copper, from which substances the Egyptians managed to produce three different products—first, a peculiar kind of red, green and blue glass; second, a brilliant enamel; and lastly, the color to which reference is made above, and which was used for painting. By synthetical experiments M. Peligot has succeeded in reproducing this peculiar shade of blue, by heating together 73 parts of silica with 16 of oxide of copper, 8 of lime, and 3 of soda. The temperature should not exceed 800 deg. Fahr., as, in such case, a valueless black product is the result.

Sensitive Silk.—Silk thoroughly impregnated with the bichromate of potash presents a very sensitive photographic surface. Thus prepared, any shapes cut out of tin and laid upon it may be beautifully imprinted thereon by the sun, and in tints according to the color of the silk itself. A white or very light silk shows a delicate pale red impression; a red-tint takes a still deeper shade of red in the pattern, etc. Fern leaves arranged to suit the taste and kept flat by a piece of sheet glass, can be imprinted in the same way.

Domestic Economy.

Household Exercise.

The *American Agriculturist* says dishwashing is good for dyspeptics. It is light exercise of the arms and chest soon after meals and it may be done sitting as well as standing. A high office stool is very useful in the kitchen. Feeble women, who do their "own work," often stand upon their feet more than necessary. You can sit down down to dress vegetables, to wash and wipe dishes, to knead bread, to iron, and to do many other things. You may be a little more slow about the work, but you will get through it in better condition. Housekeepers would often like to take an out-door walk, only their "feet are so tired."

Dish-washing would not be half so dissgreeable as it often is, if the dishes were lightly scraped free from crumbs, and neatly piled up for washing. There should be a large dish-pan and plenty of hot water, with which to fill up the pan gradually as its contents cool. I seldom use soap for washing dishes, but to the unskilled, or to those who use much butter and fat in their cooking, it seems a necessity.

Sweeping is good exercise if the floors and carpets are not dusty. Ah! that "if!" Bed-making will serve as gymnastics, if the beds are kept clean and well aired.

And what of washing? I do not think highly of the old-fashioned wash board exercise. It is hard for both lungs and back. With good washers and wringers, and strong arms for lifting, it may be made passable as exercise, and it is always a pleasure to see soiled things clean once more.

A moderate amount of ironing is good for women in health, in cool weather. On hot days endeavor to do it in a cool room or on a shady porch.

Cooking is perhaps the most important part of housework, and its exercise is not heavy in quality, though to some it may be burdensome in quantity. It seems to me more like a high art, or dignified occupation, worthy to be called a profession—far more honorable than—the legal profession, for instance. I should not wonder if really good and scientific cooks could do more to preserve and to restore health than the doctors of mendicine can. As with ironing the hardest kind of cookery is the least necessary—the ornamental part. We should study to make our cooking work as little heating as possible. For instance, bread may be baked in the oven instead of cooking it upon the griddle in the form of "pancakes," and in hot weather we can avoid those forms of food that require constant stirring while cooking.

There is a great deal of necessary work to be done in the world in order that we may all be comfortably fed, clothed and lodged. I should like to see what would be the result if the labor and strength spent upon unnecessary work, usually considered ornamental, should be given cheerfully to doing the necessary work of the world, as a preparation for the advent of real beauty or genuine adornment in all departments of our daily life.

Eggs as Food.

Would it not be wise to substitute more eggs for meat in our daily diet? About one-third the weight of an egg is solid nutriment. This is more than can be said of meat. There are no bones and tough pieces that have to be laid aside. A good egg is made of 10 parts shell, 60 parts white, and 30 parts yolk. The white of an egg contains eighty-six per cent, water; the yolk fifty-two per cent. The average weight of an egg is about two ounces. Practically, an egg is animal food, and yet there is none of the disagreeable work of the butcher necessary to obtain it. The vegetarians of England use eggs freely, and many of these men are eighty and ninety years old, and have been remarkably free from illness. A good egg is alive; the shell is porous, and the oxygen of the air goes through the shell and keeps up a kind of respiration. An egg soon becomes stale in bad air, or in dry air charged with carbonic acid. Eggs may be dried and made to retain their goodness for a long time; or the shell may be varnished, thus excluding the air, when, if kept in a moderate temperature, they may be kept good for years.

The French people produce more eggs than any other, and ship millions to England annually. Fresh eggs are more transparent at the centre, old ones on the top. Very old ones are not transparent in either place. In water in which one-tenth of salt has been dissolved, good eggs sink and indifferent ones swim. Bad eggs float in pure water. The best eggs are laid by young, healthy hens. If they are properly fed the eggs are better than if they are allowed to eat all sorts of food. Eggs are best when cooked four minutes. This takes away the animal taste that is offensive to some, but does not so harden the yolk or white as to make them hard to digest. An egg if cooked very hard, is difficult of digestion, except by those with stout stomachs; such eggs should be eaten with bread and masticated very finely. An excellent sandwich can be made with eggs and brown bread. An egg spread on toast is food fit for a king, if kings deserve any better food than any body else, which is doubtful. Fried eggs are less wholesome than boiled ones. An egg dropped in hot water is not only a clean and handsome but a delicious morsel. Most people spoil the test of their eggs by adding pepper and salt. A little sweet butter is the best dressing. Eggs contain much phosphorus, which is supposed to be useful to those who use their brain much.—*Poultry Review.*

MINING AND SCIENTIFIC PRESS.

USEFUL INFORMATION.—Restoration of Oil Paintings; Punching Holes in Straps; Improvements in Tanning; Useful Rules, 247.

DOMESTIC ECONOMY.—Household Exercise; Eggs as Food, 247.

MISCELLANEOUS—Low Grade Ores; Jefferson River Mines; Fire Trains; Big Work; Leo Mine; Important Sale; The Chinamen at Panamint; Sierra Nevada Water, 242. Plates for Testing Seeds; The Eucalyptus and its Mission; United States Mints, 246. General News, 249. The Raymond and Ely Works; Yamhill Mines; Leather Belting and Hose, 250.

THERE was considerable excitement at Silver City, Idaho, on the night of October third, over reports of remarkably rich developments in the mines of the South Mountain Consolidated mining company, located at Bullion city, twenty-six miles south of that city. At a late hour the entire populace crowded the streets, gathering in groups to discuss the probable results affecting Idaho as now secured. The average assays from the bullion yields $400 gold and silver per ton, besides the value of lead. The main ledge is five to seven feet wide, with well defined foot and hanging walls, ore eighty per cent. bullion. The mines are owned by Minear, Lent, Boyd and Willis, of San Francisco, and Salt Lake end Silver City parties.

A FOUNDRY and machine shop is to be put up in Monterey. The property has been purchased by Brown Brothers, of San José. The machine shop is to be a two-story building 50 by 30, and the foundry 35 by 50, there being blacksmith shops and other outhouses. The intention is to carry on the business in all its various branches; the construction of straw burning portable engines being made a specialty.

IT is proposed to build a wagon road direct from Los Angeles to the Panamint mines. It has been discovered that water can be had at four points on the Desert, which is seventy miles in width. This will enable teams to cross without difficulty. It is claimed the new road will make the journey four days shorter.

LARGE amounts of wood are piled up on the banks of the Carson river, at Empire. From appearances there is a supply of fuel on hand sufficient to last for years, but yet it will all be gone before spring. The amount of pine wood consumed in the furnaces of the mills and hoisting works is enormous.

INDICATIONS tend to the belief that the 1,500 foot level of the Consolidated Virginia mine on the Comstock, will greatly exceed in richness any portion of the mine yet developed, which is saying a good deal.

THE first shipment of bullion from the Calistoga Silver mine was $12,000. This was from 85 tons of rock, which is a little over $141 per ton.

PROSPECTORS in the interest of Nevada and San Francisco capitalists are visiting the mines in the vicinity of Silver Mountain, Alpine county.

MR. CARR, of Pierce county, Oregon, has just returned from Yakima, and reports the mines paying about $3 50 per day to the hand.

Glycerine for Removing Incrustations in Steam Boilers.

The frequently discussed question of the incrustations in boilers has been taken up quite recently by the Society of Civil Engineers in France. M. Eugene Asselin communicated to that society, at a meeting last January, the result of his researches on this question; that is, in the use of a new element for destroying all adhesive calcareous deposits in boilers. The importance of this subject, and the novelty, simplicity, and economy of the process recommended by M. Asselin, can best be exemplified by publishing his paper. Its importance will be evident to every mechanic. It was published in "*Annales Industrielles*," from which we translate as follows:

In boilers in which are adhering calcareous deposits, the most serious trouble is the increase of the consumption of fuel; to this must be added the depreciation of the metal caused by excessive heating and by the difficulty of removing these adhering deposits, not to mention frequent accidents by explosion.

By studying comparatively the co-efficients of the conductability of the metal on the one hand, and of incrusting deposits on the other, we see how rapidly the consumption of fuel increases as the layers of deposit thicken.

Starting out with given data, we have calculated that a boiler covered with an incrustation of three millemètres (0.1181 of an inch) consumes about 35 per cent. more fuel than one which has no incrustations, all other conditions being equal. On this point it is difficult to give precise figures, and we will only state the fact, which is universally admitted, that the consumption of fuel increases in proportion as we remove from the moment of last cleaning; and also that with bad water it is difficult to maintain the same pressure.

The fact that so many attempts, both chemical and mechanical, have been made to combat these incrustations, prove most abundantly the difficulty and complexity of the problem to be solved. It is useless to inquire into or classify the disincrustants, which are as numerous as imperfect. We shall only say that what we propose belongs to the class of preventives which are applied after feeding. The substance which, from experience, we now recommend is

Glycerine.

Glycerine is the soft principle of neutral fat bodies; or in other words, it is the basic principle which we meet with most frequently in fatty substances. The definition is clearly proven by many recent synthetic scientific discoveries, which show direct combinations of glycerine with fatty acids. By means of the improvements recently introduced into the stearic industry, glycerine occupies now an important place amongst industrial articles. Discovered long ago, it has been extensively used in pharmacy and perfumery; these uses have shown all its hygrometric qualities.

Actual Use of Glycerine.

While maintaining its modest position in the making of plasters, pomades, and as preventatives of chillblains, its sphere of usefulness has constantly increased. We all know the transformation of glycerine into nitro glycerine and finally into dynamite. We shall not recount its application as a preparative of woolen and cotton tissues, but will come at once to its use in boilers, and among the properties of glycerine we shall only mention those which are useful to retain for the said use.

Composition of glycerine: Carbon, 6 volumes; Hydrogen, 8 volumes; Oxygen, 6 volumes.

Glycerine belongs to the family of ethers; it is a liquid, soluble in water in all proportions; it is extracted (in manufacture) most frequently from sulphate of lime (called milk of lime), which results from the saponification of neutral fat bodies.

With the salts of lime its reactions are worthy of special mention as regards the application in question. Not only does glycerine raise the point of solubility of the salts of lime, especially that of sulphate of lime, but also (and that in certain conditions which are exactly realized in boilers) it forms with these salts a soluble compound. Besides (and we limit ourselves to what is actually practical) when the salts of lime are in excess, that is to say in a quantity more than sufficient for it to hold in solution at first, and to enter into combination with afterwards, this excess is precipitated into the body of the liquid containing glycerine in a gelatinous form, which settles and which is eminently suited for preventing further adherence to the metal.

Advantages Due to the Form of the Precipitate.

In addition to the above, this molecular form of the precipitate is of primary importance in opposing the mechanical force of the solid precipitated particles; indeed this is free from the serious defect in all other disincrustante, which, although they may prevent adherance, yet ought to be rejected on account of the mechanical force which they occasion.

Too much importance cannot be attached to the mechanical force. In short, with glycerine there is no double chemical decomposition and no precipitating of pulverent or granular matter. Its three modes of action are:

First—Augmentation of the solubility of the sulphate of lime.

Second—Formation of a soluble composition.

Third—Precipitation under the form already noticed.

Let us add, that glycerine is a fixed body, evaporates at 285°, that is to say at a temperature above that of the fat bodies. It is soluble in water, and has the properly of emulsing or neutralizing the fat bodies, and on account of this quality it would be a preservative in case of an accident where the water contains fat matter.

Quantity to be Used.

We have now arrived at this question, what is the quantity of glycerine to be used in the boiler?

By experiment we have found that it is in proportion to the quantity of fuel consumed. Very often inventors of disincrustante indicate the amount to be used as in proportion to the horse-power of the machine—for so much horse-power they recommend so much of the disincrustant. But in practice the power of a boiler is often used in an irregular manner. It stops at times—the horse-power may or may not be used during a given period.

It is, however, easy to say that the quantity of water employed, and of which we wish to neutralize the bad effects, is sensibly proportioned to the quantity of coal consumed.

From a series of figures we have arrived at the following result: Use one kilogramme of glycerine for every 3,000 or 4,000 kilogrammes of fuel. This is equal to one pound of glycerine to every 3,000 or 4,000 pounds of coal.

We do not pretend that these figures are rigorously correct, the nature of the water is variable, and the combustible also varies both in nature and in quality; we only say that these figures are sufficient for what are commonly called the worst waters.

This is the first figure to adopt, and after two or three cleanings having proven the real power of the product, we can then study the question of economy. Experiment only can prove whether the nature of the water will permit the use of only one part of glycerine to 5,000, 6,000, 7,000 or 8,000 parts of coal; sometimes it reaches the latter point.

We believe this method of calculating the amount of glycerine to be used is eminently practical, for we can always calculate very closely the amount of fuel used within a given period. We consider the worst waters those charged with sulphate of lime, gypsum and the salts of magnesia. Sulphate of lime is had because of the strong deposit which it forms, and the salts of magnesia are injurious because they produce foaming in the boiler.

The following is the simplest and best assay of the water: Take a fragment of the incrustation made by the water which you wish to test, weigh and dissolve it in hydrochloric acid; filter, wash and weigh the remainder, which is sulphate of lime. This assay may not be perfect, but it is sufficiently accurate to test the relative purity of the waters.

Mode of Introducing the Glycerine.

We have said that glycerine was soluble in water in all proportions; it is therefore evident that there can be no difficulty in introducing the glycerine into the boiler. We prefer to put in at one time the quantity wished and calculated—say, one part of glycerine to 3,000 or 4,000 parts of fuel necessary for 15 days, three weeks, or even a month. The length of time between the cleanings is governed by the amount of muddy water accumulated in the boiler, and not by the thickness of the incrustation.

After cleaning, the metal of the boiler will retain its bright, natural color. It is important to have the glycerine as pure as possible, especially free from lime. The less there is of lime in it, the higher will be its power as a solvent.

Although not necessary, it is economical to add to the glycerine three or four per cent. of some other chemical precipitant. This will promote the decomposition of the salts of lime, and decrease the quantity of glycerine necessary. The price of glycerine is about one franc 20 centimes per kilogramme—about two pounds; so that sufficient glycerine to neutralize the worst water would only cost about 25 centimes (four cents) per ton of fuel. We close this rapid review by declaring our conviction, produced by experience and observation of the facts, that glycerine will successfully remove incrustations from boilers, especially from tubular ones. From this, however, we except boilers using sea-water, as we have not been able to extend our experience to them.

The method above described has been in use for the past nine months, at the Mission Soap and Candle works on Sixteenth street, between Folsom and Harrison, where glycerine is manufactured. It is sold in 50 and 100-pound package at 15 cents per pound. The proprietors of these works will furnish further information to those desiring it, at their office, 108 Bush streets. They have been using it in their two boilers, and are well pleased with the results.

THE Jones and Stewart companies now have not less than 800 tons of freight, lumber, machinery and supplies of various kinds, now in course of shipment to Panamint. A gentleman recently from there says that when he left more than three hundred persons had signed a resolution to the effect that Chinamen should not be allowed to operate in that district.

A LARGE force of men, in the employ of the Imperial mining company, are now at work digging away the hill for the purpose of laying a side-track to the new ore dump shortly to be erected by the company.

Eureka District, Nevada.

This district is acknowledged by those familiar with the various mining districts of Nevada, to be superior to any outside of Virginia. The mines now being worked there look better than ever before, and they improve as developments are made. The principal mines are on Ruby hill, a distance of 2½ miles from Eureka. Ores from Secret cañon, Newark, Pinto, Spring Valley, etc., are brought to Eureka to be worked. A correspondent furnishes us with the following items from the district.

The Richmond Mine

Is on Ruby hill, and is one of the first mines in the district. They are now running three furnaces, and working about 300 men. The yield of ore per day is about 120 tons. The yield per ton of bullion is from $350 to $400. They are erecting separating and refining works, which will obviate the necessity of shipping at large expense to England and back, and will furnish employment to a good many men. The superintendent is Edward Probert.

The Eureka Consolidated

Is situated on Ruby hill, and under the superintendence of W. H. Shaw, a skillful operator. The company are running three furnaces, working about 120 tons of ore every 24 hours, which yields about 400 pounds of bullion to the ton. The bullion assays about $400 to the ton. Usually silver predominates, but the past few days gold has been in excess, about $40 per ton.

This mine and mill is under good management. Our correspondent was shown several assays of the slag, which showed no trace of mineral. They have recently constructed an extensive dust arrestor for the purpose of saving the dust and conveying the smoke away from the vicinity of the furnaces. The number of men employed by this company is about 240.

The K K Consolidated

Is situated close to the Eureka Consolidated, and is one of the best in the district. The product of the mine is about 80 tons per day; yields about the same as the Eureka Consolidated per ton. At present the mill is shut down, and the furnace is undergoing a thorough repair. The company employ about 125 men. This mine is under the superintendence of W. S. Keye, and is being very successfully managed.

The Hoosac Mining Co.

Of this mine, little has been said, but it is developing into one of the best mines in the district. It is on Bald Mountain, about six miles from Eureka. The product of this mine is about 40 tons daily; 40 men are employed at the mine and as many more at the furnaces. The ore is composed largely of lead, being about 33 per cent.: it works from $40 to $45 in silver. The body of ore is said to be very large. The furnaces of the company are closed down for repairs but will be running again in a few days. A matting furnace has been constructed for the purpose of cleansing and purifying the ore from arsenic, sulphur and other impurities before roasting, which seems to work well. This is something new in the district and reflects great credit on the superintendent and proprietor, Mr. Henry Strout.

The Dunderberg Mining Property

Is situated on Prospect Mountain about three miles west of the town of Eureka. The mine has been explored some 300 ft. in depth, by means of an incline. There is upon the property, machinery of sufficient capacity to work the mine to a depth of 1,000 ft. and it is understood that the present workings will be extended 300 ft. during the coming winter, thus, making a total depth from the surface of 600 ft. Like Ruby Hill—of which the best mining authorities in the district believe this to be a continuation, though two miles distant—the ore occurs in chambers of greater or less extent; and from workings already made has a uniform assay value of $40 in royal metal with from 15 to 20 per cent lead. There are two furnaces connected with the property, which have been in operation about four months during the present year. They have made a total output of $150,000. There is every reason to believe the work which will be done the present winter will add a value to this mine, and those in the neighborhood, heretofore unworked, although the low grade of the ore leaves but a small margin for profit, except when handled upon a very extensive scale; thus making quantity supply the deficiency in quality.

The Town

Of Eureka and vicinity contain about 5,000 inhabitants, and has a bright future before it, for the mines are considered inexhaustible. And besides the mines it is soon to be a railroad town, and the distributing point of all the other mining camps in Eastern Nevada. A number of towns will get their supplies from Eureka when the railroad is completed, that now get them from other points on the C.P.R.R. Now is the time for any who desire to purchase town property. Property that was sold here two or three years ago has since rented for nearly as much per month, as the first cost. Eureka has not built up as most mining camps have, by excitement, but on its own merits, and is bound to be a permanent town.

THEY are talking about new mines in the Laramie Peak country, Wyoming. Prospectors went there last spring but saw too many Indians. They will try it again.

Machine for Blue-stoning Seed Grain.

John Wilkie, Yuba City, Sutter Co., Cal., haa recently patented through the agency connected with this office an apparatus for bluestoning or saturating seed grain with a solution of sulphate of copper, and by this means destroying any germs of disease, and thus preparing it for sowing. In the illustration of the machine herewith shown, *A* is a horizontal box, of sufficient length, and having the seed-hopper, *B*, upon one end, and the solution-tank, *C*, to it. The bottom of the seed-hopper is made slightly inclined toward the discharge-spout, *D*, and is provided with a regulating-gate, *E*. An opening is made in the box, *A*, in a line with the spout, *D*, and through this the seed passes into the box. The solution-tank has a cock, *F*, which discharges into the same opening along with the seed. Within the box, *A*, is a longitudinal shaft, *G*. Gear wheels, *H I*, at the end of the box, serve to give motion to the shaft, either by means of the crank, *J*, or by other power.

Upon the shaft, *G*, a combined stirrer and carrier is constructed, which is in the form of a screw. The inventor prefers to construct the screw in the form of short projecting arms, *M*, which are set into the shaft at an angle, as shown. These arms serve as stirrers, and each one thoroughly mixes the seed and solution, and, at the same time, forces the mass forward, so that it will be taken up by the next stirrer. The discharge-spout, *K*, is made as shown, and is placed at the end of the box, *A*, farthest from the feed-hopper, *B*. The whole machine is set upon legs, *L*, of suitable hight, and is easily made, and effective in its operation. Further information concerning this machine can be obtained by addressing the inventor, as above.

Grease in Batteries.—We copy the following item from the Colorado *Register*: "The idea has long been current that the presence of grease in stamp mill batteries will prevent the amalgamation of the gold. Last week, after considerable observation, one of our prominent mill men undertook to test the matter. For forty-eight hours he had his men feed lard oil into one battery, while the others were kept scrupulously free from everything greasy. On cleaning up he found the battery which had been fed with lard oil, had saved fully as well as the others, and now he considers oil and grease a benefit rather than otherwise." This is entirely opposed to the notions of most mill men on this subject. Even if of no harm, what possible benefit the grease could be we do not understand. Will the *Register's* "prominent mill man" rise to explain?

San Diego Mines.—Mr. Norway, Deputy United States Surveyor completed his survey of the Cuyamaca grant last week. This survey was made in accordance with the instructions of the Surveyor-General, under the recent decision of the Secretary of the Interior, confirming Commissioner Drummond's rejection of the Pascoe survey. The lines of the Norway survey include the best part of the timber lands within the Cuyamaca diseño. The north line of the survey runs six miles south of Julian, and thus leaves the mines out of the grant. This Mexican grant has been a great drawback to the mining interests of the county.

Croppings of coal recently found near the railroad East of Battle Mountain, Nevada, has created quite an excitement at Battle Mountain, and the general impression is that extensive coal fields exist there, and a new district has been organized, which is called the Rising Sun. It is situated about twenty-six miles east of Battle mountain, and ten miles from Shoshone point, on rock creek.

The Denver Fair.—The bullion display at the late fair in Denver, Colorado, was a great feature. A brick of gold worth $20,000 was exhibited. Silver was represented in a stack of 45 bricks worth $75,000, the result of 18 days' run of the Boston and Colorado Smelting Co. The exhibition of ores was not what was expected.

In Montana, take it as a whole, the year 1874 has not been a prosperous one for miners. Water has been short everywhere, notwithstanding the fact that early in the season the prospects were very bright. The mines have generally paid well, but the season of abundant water was of but a couple of months' duration.

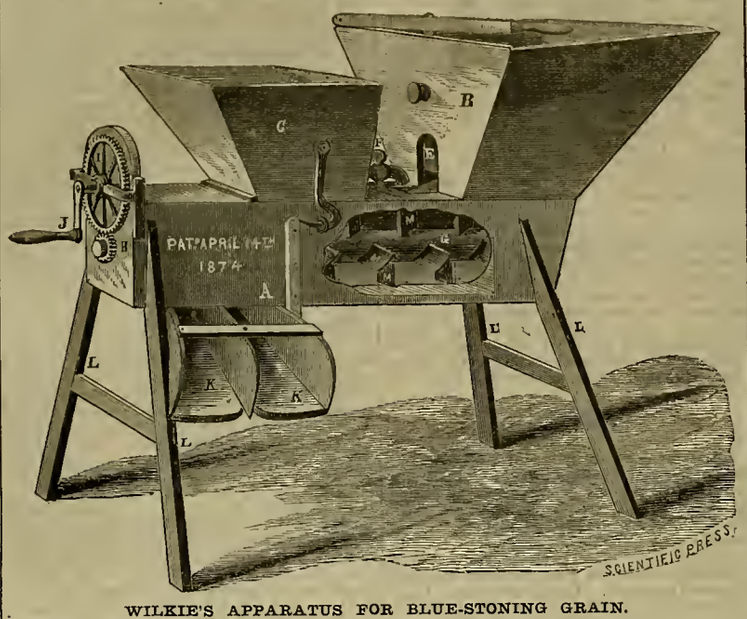
It is estimated that about one-tenth of the product of ores in Gilpin county, Colorado, is obtained from smelting ores, and nine-tenths from those crushed in stamp mills. It also appears that the Gilpin county gold ores thus far smelted, have produced three ounces of silver for every one of gold.

Eureka Bullion.—During September the Richmond furnace, at Eureka, produced $920,000; Eureka Consolidated, $446,000; Ruby Consolidated, $450.380; Hoosac, $200,500; K K Consolidated, $200,000; total, $2,276,880. Of this amount a total of $1,959,425 was shipped.

Eureka.—The number of tons of ore extracted from the mines of Eureka county, Nevada, from June 30th, 1873, to June 30th, 1874, was 70,408 ton. Yielding the sum of $2,707,659.

Improved Brick Hoisting Machine.

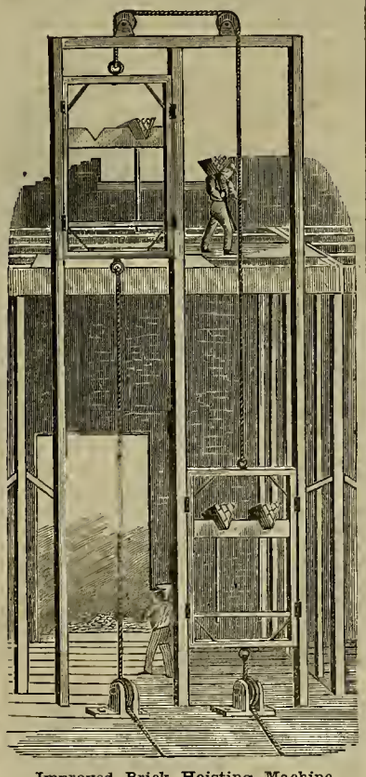
The accompanying illustration shows a machine for hoisting brick, mortar, etc., invented by Thomas Mann, and now in use in this city at Parkinson's building on Geary street above Kearny. Several of these hoists have been used in Portland, Oregon, for the past few years and have given general satisfaction. The method of operation is very simple as may be seen by the cut. Uprights are fixed in position to any desired hight in which frames for holding the hods, etc., slide. The uprights are 2x4 with a 2x4 cross piece bolted



WILKIE'S APPARATUS FOR BLUE-STONING GRAIN.

across the top, forming a support for the pulleys. The hoisting rope is made long enough to be extended to the top of the building as the different stories are completed.

The rope which runs through the ground pulleys is continued around an anchor pulley.



Improved Brick Hoisting Machine.

The horse is attached to this rope, and walks back and forth just as far as it is necessary to hoist; that is, if the hoist is 40 feet, the horse walks 40 feet, to hoist the load. The horse raises a load in going both ways, one of the frames going up as the other comes down, so it is unnecessary to bring the horse back to the starting point to raise a new load.

A carpenter can make the whole apparatus easily and the lumber can be used up in the building after the hoist is done with. Lugs, or small sheets of iron, are fixed on the frames to keep them in position, and a small pulley is placed in a slot on the frame to reduce the friction against the uprights. A piece of timber across the lower parts of the uprights keeps the lower pulleys down and in position.

The advantage claimed for this apparatus over others of similar nature is that the bricks are taken up on the scaffold where they are needed without being broken up. The mortar is carried up in the same manner and delivered on boards, where wanted without further handling, after being once put in the hod. Steam, horse or water power can be used for hoisting. The stuff used in the construction of the hoist can be utilized for partitions, etc., in the building, so there is little expense in putting one up. In buildings in country places, where men are scarce, an apparatus of the kind would be invaluable, and in large buildings in the city, it saves time and labor, beside delivering the brick unbroken and very rapidly.

The Nevada State Fair.

The first fair of the Nevada State Agricultural, Mining and Mechanical Society, will be held on Tuesday, Wednesday and Thursday of next week. The department of mines, minerals and metals is very well laid out and the display is expected to be very large. Money premiums are given to all in this department. Exhibitors to this department are required to accompany specimens with its assay value, name and description of the mine from which it is taken, depth of working below surface, district and location of mine, width of vein at different points, length of claim, etc. No specimen will be received or placed on exhibition unless meritorious. The officers of the society will take especial pains to display to best advantage all articles in this department, and will classify them, so as to compare all specimens similar in character. All specimens exhibited and donated to the society, with the accompanying description of location and character of mine, will go into the society's cabinet, and be open to the public for inspection. In this manner the society will be able to gather a magnificent collection.

The awards are full and generous. For the best collection of gold ores, $25 is given, and individual best specimens of this class of ore receive $10 each. For the best collection of silver ores the society's medal is given, and for ruby, horn, antimonial, bromide, chloride, native silver, etc., $10 each is given. Similar premiums are given for copper ores, ores of tin, platinum, lead, zinc, mercury, iron, coal, borax, salt, bluestone, etc. An entrance fee of ten per cent on the amount of premium will be charged on all articles competing for premium.

This fair is a very important one for the State of Nevada, and the mineral department in particular ought to be magnificent. Here in California we have never had a first class exhibit of ores at any of our fairs, except the exhibition of individual collections. It seems to us as if the society having the above exhibition in charge ought to gather a splendid mineral collection, which will increase from year to year in volume and value. The State of Nevada ought surely to be able to make a far more creditable display of various ores and minerals than has ever before been shown.

The miners of the West Riding of Yorkshire having refused to consent to a reduction of 20 per cent. in their wages, have been locked out to the number of 6,000.

The San Juan miners generally are leaving the mountains and preparing for the coming winter. Many of the prospectors will winter in Animas valley.

From 15 to 20 tons per week of refined borax is produced in this city, which sells at about ten cents per pound, wholesale.

General News Items.

Silk Imports.—The total value of silk imported into New York, during the month of September, was, in round numbers, $3,000,000.

England and the Pope.—It is officially announced that the English Government will withdraw its diplomatic representative from the Vatican.

The India Famine.—It is said that there are still 600,000 natives fed by the Government of India, in consequence of the continued famine in that country.

Another war cloud seems to be hanging ominously over Europe. The President of the Baden Cabinet said in a recent speech that Germany must be prepared for a fresh war. She is accordingly increasing her army.

National Bank at Petaluma.—A Washington dispatch says the Controller of the Currency has authorized the organization of the First National Gold Bank of Petaluma, California, with a capital of $200,000.

Prussian Designs on Porto Rico.—The latest phase of this matter, by telegraph of Wednesday is to the effect that Bismark agrees to guarantee to Spain the interest on the Spanish-German loan, taking as security for its ultimate payment a lien on the Island of Porto Rico.

Resuming Specie Payments.—The Bank of France is making efforts for an early resumption of specie payments. These efforts are exciting much attention in the financial circles of Europe, as a large absorption of bullion will occur, which must lead to a sharp advance in the price thereof.

A Nitro-Glycerine Explosion in a Colorado Mine.—A tremendous nitro-glycerine explosion occurred at the Sherman mine in Caribou at 11 o'clock Sunday night last. The building was totally destroyed. A. Arnold and H. W. Foreman, part owners of the mine were sleeping in the building. Arnold was killed, but Foreman escaped with a slight injury. It is supposed that a spark fell into some loose powder in one corner of the building and exploded it, and the concussion exploded the nitro-glycerine.

Overboard in Mid Ocean.—Paul Boynton left New York on Sunday last by the steamer Queen, with the intention of trying the hazardous experiment of abandoning the vessel about 200 miles from Sandy Hook, for the purpose of testing the merits of Merriman's life saving dress. His intention is to float and swim homeward until picked up by some inward-bound vessel. The suit envelopes all but the face of the wearer, and is capable of sustaining a weight of 200 pounds. Boynton will carry in a water-proof bag a sufficiency of water and provisions to last ten days.

The Whalers out of Luck.—Capt. Ravens, of the *Timandra*, writes from the Arctic ocean that the season has been very mild, and only five whales seen among the whole fleet up to date (August 10th). The winds were very mild and mostly from E. S. E. to S. S. W., with thick fog. On July 25th the current running to the southward, the heavy ice came down, and all the whales went north ahead of the ships. The bark "Onward" got one whale, and the bark "Illinois" fifty barrels of walrus oil. The "Europa," "Arctic," "Josephine," "Joseph Maxwell," "Morongo," and "Camilla" got nothing. The "Jesse Perry" and "Progress" each got one whale. The brig "Timandra" got one whale, 8,000 pounds whalebone, 9,500 pounds ivory, 16 large caese furs, and six large casks of oil.

The Indian War.—General McKenzie, operating near Fort Worth, Texas, says: After repelling two attacks by the Indians on the 26th and 27th of September, marched all the night of the 27th and surprised at sunrise the following morning five camps of Cheyennes and their allies, on Jute creek, near the fork of Red river. The troops destroyed over 100 lodges and the entire outfit, and captured 1,424 horses and mules, of which 1,048 were at once killed. The bodies of four Indians were brought in. Our loss was one soldier slightly wounded. General McKenzie is in pursuit, with thirty days' provisions. It is also stated that twenty-four lodges of Kiowas under Santanta surrendered to General Neill on the 5th of October. Several notable chiefs besides Santanta surrendered.

South Shore Railroad.—The change heretofore noticed in the line of the Southern Pacific Railroad, is likely to be consummated within a short time, as the railroad authorities have secured the right of way along the southern shore of the bay, and are about putting their forces to work cleaning, grading etc. The new line will be from the vicinity of the depot, at Fourth and Townsend streets, skirting the bay shore through the new town of Burlingame, to a point at or near Redwood City, where it joins the old route. The shore route avoids the heavy grades and shortens the distance between the city and the proposed junction three miles. When this plan shall have been carried out it is proposed to bring much of the grain freights from the southern counties to this city; which, by reason of the heavy grades on the San Bruno mountains, has heretofore gone around by way of San José to Oakland. This move will have a good effect on that part of South San Francisco adjacent to the railroad reservation, and along the proposed line of road.

The Raymond & Ely Works.

In describing a visit to the Rsymond & Ely company's hoisting works, the Pioche *Record* says: The approach to tbe works has been mnch improved. A large open space has heen leveled, which answers a most nseful purpose in receiving freight teams, piling lumber, etc. The foreman and time-keeper's offices hsve been removed to another point where convenient accomodstions has been provided for them and tbe chief engineer. As we entered the buildings we fonnd a grest number of men at work, mostly carpenters, who were bnsy preparing the massive timbers to be used in setting up the new machinery and pumping gear. Here we met our friends T. J. Andrews, the foreman, and G. E. Ames, the chief engineer of the mine. Mr. Ames was good enough to interrupt his business and explain the operations then in progress and also the working plans.

The whole of this machinery will be placed on a foundation containing 1,800 perches of massive stone work. For the engine bed three enormous masses of granite will be used. These blocks are seven feet long, 3¼ feet wide and 18 inches thick. Beneath the mortice wheels and their attendant gearing sole plates will be placed, three of them 24x4 inches, and 24 feet long, and one of them the same size, but only 14 feet in length. These will be set on timbers 26x24 iuches square, and they will again be bolted down hy vertical and angle irons, three inches in diameter, and from 12 to 16 feet in length, securely anchored in the masonry. The machinery will drive a series of six plunger pumps and one lift pump, all of 12-inch bore and seven feet stroke. The plunger pumps will be plsced 200 feet above esch other. At intervals of 400 feet in tbe shsft three balance bobs will be placed. The pump rods will be 11x11 inches each, 25 feet long and connected by plates 12 feet long, six inches wide and ¾ inch thick, witb 24 one-inch bolts in esch joint. The pump column will be made of the best quality of iron, one quarter and five-sixteenth of an inch thick. The main pump rod will be straight and continuous, and the lifts for the intermediate pumps will be clamped on the main rod, so tbat the strengtb of the latter will not be in the slighest degree impaired. For the purpose of moving the lower or lift pump, wbich will be necessary as the shaft descends, a peculiar and enormously powerful winze will be used, by which four men will be able to raise a weight of 14 tons.

Mr. Ames has, by an ingenious contrivance of his own, modified this machine so that by the means of a very heavy chain it will be more useful and easily managed.

For the purpose also of moving the machinery of the pump shaft, on the surface there will be a reel containing a sufficient length of the best steel wire cable, 1¼ inch in diameter, which will be used only for the purposes of the pump shaft. For the purpose of hoisting this macbinery, the huge buildings at the works have been enlarged. The excavations for receiving the foundations csnnot be less tban 90 feet in length, and where tbe engine is placed, some 37 feet in width. It is of conrse much narrower as it approaches the shaft, where room is only needed for the foundation of the pump bob.

Beginning with the motive power, on wbich, whether it is money, brains, muscle or steam, everything else depends, Mr. Ames showed and explained to us the drawings of the engine, whicb, for size and power, will have only one equal in the State, and that is the Savage. It is what is known as a Poppet valve engine with a Corliss bed. The cylinder is 26 inches in diameter, with a 72-inch stroke, with its exhaust port on tbe lower side, ensuring complete drainage. The fly wheel is 24 feet in diameter, and weighs the trifling amount of 30 tons. The steam for giving this ponderous monster active power, will be generated in six tubular boilers, 16 feet long by 54 inches in diameter. Four of these are alresdy in place and use, and the other two arrived just at the moment that we were leaving the building. The foundation for tbem has already been prepared, so that they can at once be placed in position and forth with be bricked in. From the engine the main driving sbaft will proceed and carry two pinion wheels which work into two large mortice wbeels. These are 12 feet in diameter with 14 inch face. The cogs on these wheels are formed of extremely hard, tough wood, and are deemed preferable to iron, as they wear better and offer greater resistance to a sudden strain. Witb these is connected a huge pump "bob," a most massive piece of work, calculated to bear almost any strain. The timbers forming this are 30x26 inches. Both bottom snd upright will be ironed, bolted and strengthened in every possible manner. That it needs be of enormous solidity may be imagined when it is remembered that one end will carry the 1,200 feet of pump rod, with its connections, and on the other extremity is placed the balance box, which is capable of holding 50 tons. These together will hring such a strain on tbe timbers that they must necessarily be of huge dimensions.

After we were through inspecting and making notes of the plans, Mr. Ames, accompanied by Mr. Andrews, kindly piloted the way to another large building where a very complete machine and boiler making shop is to be seen. Here we found the old Raymond & Ely engine which has hoisted so many thousand tons of rich ore to the surface, doing good service in running the machinery of the shop. The establishment is well stocked witb excellent tools, including rollers, shears, punching machine, planing machine, a large well-appointed lsthe, and also a lathe for wood work. While we were present one of Bement & Dougherty's patent 20-inch drilling machines wss heing unpscked. Mr. Ames informed us that it is the finest implement of the kind known. He also told ns thst a magnificent lathe wss now on the wsy hitber msnufactured at Fitchhnrg, Mass., costing at the msnufactory $2,000. The bed of the new lsthe will be twenty feet in length, with 36-inch swing. Attsched to the mschine shop is a boiler factory, where seversl men were at work making some elbows of very hesvy boiler plate, snd the portion of tbe work tbat tbey had finished showed that they understood their bnsiness. So soon as opportunity serves a fonndry will be erected close to the machine shop, making the whole a most complete establishment. These shops, etc., will be found to be most nseful to the company in the future. Isolated as this point is, so far from large manufactories, and having so much machinery constantly in use there will daily be fonnd an occasion to employ the facilities which we have just described. In conclusion, we cau bnt congrstulate tbe company on having a staff of such trustworthy and capable officers. Capt. Day, the superintendent, Mr. Andrews, the foreman, and Mr. Ames, the chief engineer, all seem to spare no effort to promote the interests of the company. To Mr. Ames much credit is due for the able and skillful manner in which he has designed, is prepsring for and will erect the massive and costly machinery which, when finished, we are aure, offer a convincing proof of his thorough knowledge of his profession as an engineer. To him and Mr. Andrews we desire to offer our very sincere thsnks for their courteous reception and kind attention.

Yamhill Mines.

The Rock creek ditch is still flowing its full capacity of water, and finding ready sale. Not so many claims are being worked as during previons seasons, but larger heads are used. Steel, Hagan & Co. (Little Giant) are running steadily and profitably. McNamara & Co., northwest from them, pushed their cut until it interferes with the road, and were changing the road lsst week. The ground pays. Upon Granite bsr, Broaddus & Co. have the best claim we have seen, with 60 feet banks to work to. Mr. Broaddns is foreman, and the working of his mine is evidence of his skill as a miner. They have beeu working on the lower bank for some time, but this week returned to the npper bank, which is very rich and will make good pay on the remaiuing ground. Batterton Bros., further on toward Granite, have their Little Giant at work and are cleaning up pretty regularly over 100 ozs. per week. Last week, owing to rnnning through an old crosscut, the product fell off to $1,300. Another like cut comes in this week, but after that they have fresh ground again. Their top dirt is comparatively shallow, and they have all facilities for profitable mining. The mine is good property. The next claim belongs to Capt. Rogers' estate, and is intersected by Granite gulch. Capt. R. had brought a flume up Granite, and was openiug a cut to the south with the purpose of working a Little Giant at that bar, but it developed too many boulders, and work is now being directed, under the foremanship of Mr. Israel Gibbs, on the ground north of the gulch, where a prospect shaft has shown a good deposit of pay gravel. These claims only employ some 35 or 40 men, water having been utilized in a great measure as a substitute for manual labor. Although as statcd, all the water available finds ready sale, it is anticipated that in a year or two an extension of the ditch will be made to cover good paying ground in Squaw gulch, above Pioneer, and, perhaps, by means of high flumes or pipe, around to Independence district east and north of Yamhill on the district extension of the rich Pilgrim bar channel, and where extensive prospecting has demonstrated there is a vast deposit of rich gravel.—*New Northwest.*

Oregon Mining Items.—The quartz mill from Gem City hss been moved to Connor creek.

Mr. Carr, has just returned from Yakima, and reports the mines paying about $3 50 per day to the man.

It is reported that new diggings have been struck on Snake creek, about 30 miles north of Pierce City, which promise well. There is considerable excitement at the latter place.

Last week, Johnny Roy, from the Caoell ledge, left at Virtue's bank, Baker city, over 300 ounces of bullion. Water has increased in the Elk creek district, and eight stsmps are now running at the mill.

Capt. Blynn, of Olympia, received from bis new mines in Lewis county, last Thursday, ten tons of coal.

The Olympia *Transcript* is informed by Mr. George Boyce, of Fall City, King County, that a silver lode was discovered on the Skokomish, about 20 miles from Snobomis City, some ten days ago.

Land is rapidly increasing in value in Santa Barbara county. A few days ago Spencer L. Skeels sold twenty-one acres lying in Montecito, for $100 an acre. This land could have been purchased from Col. Dismore one year ago for $35 an acre.

This year's wheat crop in New Mexico was threshed in tbe old Egyptian style—with goats, sheep and horses.

Leather Belting and Hose.

H. N. Cook exhibited at the lste Mechanics' Fair, samples of lesther belting, hose, mail and money bags. As representing a home industry the display wss one of the most interesting at the fair. The two largest belts exhibited is for the Pacific Rolling mills, snd are the longest used in sny factory on tbe coast. They are made iu the best msnner, and will besr the closest inspection. The hose is msde very strong snd substsntial. For a time after the introduction of rnbber hose, the trsde in leather hose declined materisily, but is now reviving, on account of the durability of leather and the facility witb which the hose can be mended. The fire pails, mail bags, etc., exhibited, are thoroughly made, and tbe whole display reflects great credit on the exterprising exhibitor, who has carried off a number of diplomas from different Fairs on this coast. He has been in business in this city 12 years, buil up an important trade. In connection with his factory, at 415 market street, he hss an extensive steam tannery on the Potrero, and one of the largest and best arranged on the coast. Mr. Cook fonnd the establishment of this tannery a necessity. It was started expressly for the purpose of tanning whole hides for large belts, as such hides could not be pnrcbased in the market. The business at its inception was an experiment, snd many thought it impossible to make the enterprise profitable. But it has grown rapidly into one of the most important industries on the coast, giving steady employment to about 30 men.

Massachusetts Hill Mining Claims.—The fame of Massachusetts bill mining claims is almost world wide. There are several "properties" on that hill which have been idle for years, and which are estimated by owners, and by outsiders also, as being of great value. There have been, from time to time, talks and rumors about the consolidation of the various claims and tbe organization of a large company to work the various ledges of the hill. Such talks and rumors have generally arisen from those who want to see tbe work done, more than from the owners in the various claims. Within a few days, however, the owners of the hill have been in long and serious cousultation over matters pertaining to the claims there, and it is possible that a consolidation of interests may follow in consequence of these consultations. The main object just now seems to be not consolidation, but the obtaining of United States patents for the mines, claims and mining ground on Massachusetts hill. Yesterday representatives of companies met on the ground in order to settle tbe boundaries of the claims, preliminary to applications for patent. There is no dissgreement on the subject of boundaries, and present harmony leads to the hope that the future will soon cause the wished-for consolidation and the working of one of the best gold-bearing hills in the State of California, if not in the world. The following are the owners of the Massachusetts hill ground: Scadden Flat Co.; Stockbridge Co.; Boston Ravine Co.; Riley & Ford; Watt & Co.; Rocky Bar Co.; and Gold Hill Co.—*Grass Valley Union.*

Economy in Furnaces.—Furnaces witb large area and suitable feed-heaters are the most economical in all respects. But in order to obtain the best results much care is needed in stoking. A little at a time, and often, should the coal be spread over the front of the fire, and the bright coal pusbed back to the bridge. At the same time, the least possible quantity of cold air should be admitted. It is difficult to ensure from any stoker sufficient attention to obtsin good results as a regular thing. We must, no doubt, therefore soon fall back upon the best mechanical stokers which can be obtained, if we wish to reslize the full value of good stoking.

Fordyce Dam.—The work on tbe dam being erected by the South Yuba Canal Co., at Fordyce valley, is progressing as rapidly as a large force of men can make it. We learn that it will be so far completed that by next spring it will be able to hold a body of water 38 feet deep, one mile wide and two miles long. The valley is so situated that it will catch the water falling on the hills for miles around. It will sdd greatly to the capacity of the company to furnish water to the mining companies adjacent to their ditches, and will be not only a source of increased revenue to tbe owners of the ditches, but will afford increased facilities for obtaining the precious metal from many mines of the county.—*Transcript.*

New Casing for Steam Pipes.—The following composition has been patented in England for cssing steam pipes: Potter's clay, 150 lbs; sawdust, 24 lbs; fine shavings, 12; cow's hair, 2½; tar, 18; water-glass (sp. gr. 1.7), 18 lbs; creosote, 5 pints. Another formula consists of clay, 150 lbs; cork dust, 24; cow's hair, 4; tar, 18; water-glass, 25; chalk, 10; coarse soap, 5 lbs; creosote, 7 pints.

Goon Arranoements.—The American Flat Mining company have bought one-half of the hoisting works and shaft of the Baltimore Mining company. This is a very good arrangement, as both mines adjoin, and will be prospected and worked through this shaft to the very best advantage possible.

The Consolidated Tobacco company, of Gilroy, is holding on to its prodncts for a raise in the price, which is likely to follow in consequence of the partial failure of the crops in Virginia and other Eastern States.

DEWEY & CO.

American & Foreign Patent Agents,

OFFICE, 224 SANSOME STREET, S. F.

PATENTS obtained promptly; Caveats filed expeditiously; Patent reissues taken out; Assignments msde and recorded in legal form; Copies of Patents and Assignments procured; Examinations of Patents made here and at Washington; Examinations made of Assignments recorded in Washington; Examinations ordered and reported by Telegraph; Rejected cases taken up and Patents obtained; Interferences Prosecuted; Opinions rendered regarding the validity of Patents and Assignments; every legitimate branch of Patent Agency Business promptly and thoroughly conducted.

Our intimate knowledge of the various inventions of this coast, and long practice in patent business, enable us to abundantly satisfy our patrons; and our success and business are constantly increasing.

The shrewdest and most experienced Inventors are found among our most steadfast friends and patrons, who fully appreciate our advantages in bringing valuable inventions to the notice of the public through the columns of our widely circulated, first-class journals—thereby facilitating their introduction, sale and popularity.

Foreign Patents.

In addition to American Patents, we secures with the assistance of co-operative agents, claims in all foreign countries which grant Patents, including Great Britain, France, Belgium, Prussia, Austria, Victoria, Peru, Russia, Spain, British India, Saxony, British Columbia, Canada, Norway, Sweden, Mexico, Victoria, Brazil, Bavaria, Holland, Denmark, Italy, Portugal, Cuba, Roman States, Wurtemberg, New Zealand, New South Wales. Queensland, Tasmania, Brazil, New Grenada, Chile, Argentiue Republic, AND EVERY COUNTRY IN THE WORLD where Patents are obtainable.

No models are required in European countries, but the drawings and specifications should be prepared with thoroughness, by able persons who are familiar with the requirements and changes of foreign patent laws—agents who are reliable and permanently established.

Our schedule prices for obtaining foreign patents, in all cases, will always be as low, and in some instances lower, than those of any other responsible agency.

We *can and do* get foreign patents for inventors in the Pacific States from two to six months (according to the location of the country SOONER than any other agents.

Home Counsel.

Our long experience in obtainiug patents for Inventors on this Coast has familiarized us with the character of most of the inventions already patented; hence we are frequently able to save our patrons the cost of a fruitless applicatiou by pointing them to the eame thing already covered by a patent. We are always free to advise applicants of any knowledge we have of previous applications which will interfere with their obtaiuing a patent.

We invite tbe acquaintance of all parties connected with inventions and patent right business, believing that the mutual conference of legitimate business and professional men is mutual gain. Parties in doubt in regard to their rights as assignees of patents, or purchasers of patented articles, can often receive advice of importance to them from a short call at our office.

Remittances of money, made by individual inventors to tbe Government, sometimes miscarry, and it has repeatedly happened that applicants have not only lost their money, but their inventions also, from this cause and consequent delay. We hold ourselves responsible for all fees entrusted to our agency.

The principal portion of the patent business of this coast has been done, and is still being done, through our agency. We are familiar with, and have full records, of all former cases, and can more directly judge of the value and patentability of inventions discovered here than any other agents.

Situated so remote from the seat of government, delays are even more dangerous to the inventors of the Pacific Coast than to applicants in the Eastern States. Valuable patents may be lost by the extra time consumed in transmitting specifications from Eastern agencies back to this coast for the signature of the inventor.

Confidential.

We take great pains to preserve secrecy in all confidential matters, and applicants for patents can rest assured that their communications and business transactions will be held strictly confidential by us. Circulars free.

Engravings.

We have superior artists in our own office, and all facilities for producing fine and satisfactory illustrations of inventions and machinery, for newspaper, book, circular and other printed illustrations, and are always ready to assist patrons in bringing their valuable discoveries into practical and profitable use.

DEWEY & CO.,

United States and Foreign Patent Agents, publishers Mining and Scientific Press and the Pacific Rural Press, 224 Sansome St., S. F.

The Mining and Scientific Press--Ever Onward.

Our careful system of compiling, judiciously condensing, and conveniently arranging into regular departments, has been heartily endorsed. It renders the paper worth more to readers, who can find handily that which interests them most.

The weekly issues of the PRESS will contain reliable

Information for Practical Miners,

Treating on the Opening of Mines; Mining of Ores; Milling of Ores; Smelting of Ores; Separation and Roasting of Ores; Amalgamation; Saving of Gold and all precious Metals; Now Processes of Metallurgy; New Discoveries of Mines; Mining Engineering and Hydraulics.

For Inventors, Mechanics and Manufacturers.

All new and important developments in Scientific and Mechanical Progress; Patents and Inventions of the Pacific States; Progress of Home Industries; Hints for Local Manufacturers; Illustrations of New Machinery; Reports of Popular Scientific and Industrial Lectures.

Our Mining Summary

Gives the progress of mining work from week to week in the various counties and districts throughout the principal mining regions of the United States, arranged in alphabetical order. It is the most extensive record of mining operations published in the world. It affords the intelligent miner a rare opportunity to know and profit by the work and experience of his neighbors. Miners have few sources of practical information in their calling, and should embrace every reliable means for improvement. Mining Operators and Shareholders, at home and abroad, weekly examine our Summary with increased interest and profit.

Our "Domestic Economy"

Embraces new and important facts which should be known in every cabin and household. Short and interesting—the articles under this heading are freely read and practiced with profit and improvement to the readers.

The PRESS is not strictly a "paper for professional scientific men," but rather a

Liberal and Popular Scientific Journal,

Well calculated to make practically scientific men from our intelligent masses. This is our stronghold for accomplishing good. Plain, correct and pleasing language, easily comprehended by all, confined mostly to short articles, is our endeavor.

For Self-Improvement,

Every issue of the PRESS abounds with articles of an elevating character, to stimulate the higher virtues and natures and progressive intellects of both men and women.

Hundreds of Dollars

Are oftentimes saved to the readers of this paper by a single hint or article of information in its columns; Such instances have been repeatedly reported to the editors and proprietors during their long connection with the PRESS. Our paper presents

The New and Novel Developments

In the progress of this comprehensively new section of the Union (but recently settled and now rapidly increasing with a population of the most intelligent and venturesome people, attracted from nearly every quarter and clime on the globe), enable us, with our enterprise, to display vigor and freshness in our columns not met with in similar journals elsewhere. The same circumstances also render such a paper more especially valuable to its readers in a new, and, to a certain measure, untried field, where the best methods and processes of industry are not so well established or traditionally known as in older communities. Published experiences often save costly experiments and disastrous results.

A Great Variety of Industrial Information,

In brief and fresh form, suited to the wants and tastes of the readers of this coast, which is not obtainable otherwise so timely, or in so cheap and convenient form. As an industrial publication, meeting the wants of so many kindred industries, this journal stands pre-eminent and without a precedent.

Subscriptions payable in advance—$4 per annum Single copies, post paid, 10 cents. Address

A COMPLIMENT.

PLAINSBURG, MERCED CO., CAL., June 22, 1874.

DEWEY & Co.—*Gentlemen:* I herewith tender my grateful acknowledgements for the energy, promptness and efficiency which you have displayed in procuring my patent.

Although you were entire strangers to me when I first communicated with you, I soon felt satisfied you were gentlemen of integrity, and shall always be happy to represent you as such. Very truly yours,

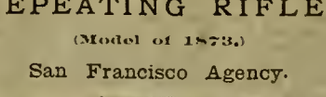
H. W. RUCKER, M. D.

The MINING AND SCIENTIFIC PRESS, San Francisco, Cal., Dewey & Co., is a rich *placer*, wherein golden information may be found, valuable to any searcher after knowledge.—*Newark Manufacturer.*

THE NEW WINCHESTER REPEATING RIFLE,

(Model of 1873.)

San Francisco Agency.



The Winchester Repeating Arms Company, of New Haven, Conn., have recently made still further valuable improvements on the celebrated Henry Rifle, which now make it, beyond doubt, the most magnificent weapon in the world. They have just introduced this beautiful arm upon the market, and their San Francisco Agency is fully supplied with all the various styles, together with cartridges for the same.

In the manufacture of the new gun, iron mountings (blued or case-hardened) have been substituted for gun metal or brass, thus increasing the strength of the arm and decreasing its weight. It is also now so constructed as to carry a Central Fire Cartridge holding one-third more powder than used in the cartridge of the model of 1866, thereby greatly augmenting the power and accuracy of the weapon.

THE SPORTING RIFLE

Has a Set or Hair Trigger which can be used at will—set or not set, as preferred. All the arms have a sliding lid which covers the opening in which the Carrier Block moves up and down. This lid, by the action of the Carrier Lever, is always open when the gun is fired, and closed by hand when the firing ceases, thus protecting the lock and inner works of the gun from dust and rain.

Various other improvements, which it is not necessary to mention in detail, by which the strength of the several parts is increased and the general appearance of the gun improved, have also been made.

There is now a greater variety of the Sporting Rifle than heretofore. They can be had with a length of barrel (round or octagonal) ranging from 24 to 30 inches, fitted with Globe and Peep Sights, or any other kind in use.

The Carbine is now made with all the improvements above referred to, except the set trigger.

The Sporting Rifle and Carbine will also be made as Extra Arms, Gold, Silver or Nickel Plated, plain or beautifully engraved.

MILITARY ARMS.

Still further improvements have been accomplished which overcome all objections heretofore raised against the Repeating Rifle as an army gun. It is safe, certain and effective in fire, whether used with deliberation or during excitement in action, and no more motions are required than in operating the old model gun.

More extended and minute particulars concerning the new gun can be had by writing or applying to the San Francisco Agency for circular.

CARTRIDGES.

The trade is notified that the Shells of the Central Fire Cartridge for the new gun can be reloaded, and that the Winchester Repeating Arms Company are manufacturers of every description of Cartridge used for Carbine, Rifle and Pistol of any make, and that the Company have a full stock constantly on hand at their San Francisco Agency

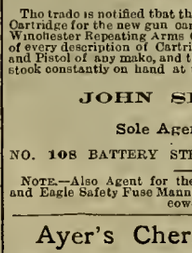
Ayer's Cherry Pectoral,

For Diseases of the Throat and Lunge, such as Coughs, Colds, Whooping Cough, Bronchitis, Asthma and Consumption.



The few compositions, which have won the confidence of mankind and become household words, among not only one, but many nations, must have extraordinary virtues. Perhaps no one ever secured so wide a reputation, or maintained it so long, as AYER'S CHERRY PECTORAL. It has been known to the public about forty years, by a long continued series of marvellous cures, that have won for it a confidence in its virtues, never equalled by any other medicine. It still makes the most effectual cures of *Coughs, Colds, Consumption*, that can be made by medical skill. Indeed the CHERRY PECTORAL has really robbed these dangerous diseases of their terrors, to a great extent, and given a feeling of immunity from their fatal effects, that is well founded, if the remedy be taken in season. Every family should have it in their closet for the remedy and prompt relief of its members. Sickness, suffering and even life is saved by this timely protection. The prudent should not neglect it, and the wise will not. Keep it by you for the protection it affords by its timely use in sudden attacks.

TO MILLMEN AND MINERS.

ASSIGNEES' SALE. IN BANKRUPTCY.

NOTICE IS HEREBY GIVEN THAT THE UNDERsigned, under and by virtue of the power and authority vested in them, and by virtue of an order of the District Court of the United States for the District of California, made and entered on the 16th day of September, A. D. 1874, in the matter of the MENDHA SILVER MINING COMPANY, Bankrupt, will sell at public auction, in the city and county of San Francisco, at the auction salesroom of John Middleton & Son, No. 310 Montgomery street, on

Friday, the 23d day of October, A. D. 1874
At 12 o'clock, M.,

All that certain mining and mill property and premises situate in Highland Mining District, near Pioche, State of Nevada, described as follows, to-wit:

One twenty-stamp mill and machinery, together with the appurtenances belonging to the same and necessary for the proper working thereof;

Also, the mill site and the spring known as Mendha Spring, and the tract of land surrounding the same to the extent of twenty (20) acres;

Also, all the water-pipe connecting the springs with said mill;

Also, the buildings, office, stable, boarding-house, etc., upon said land and adjacent to said mill;

Also, the "Stetefeldt" furnace in said mill;

Also, the following named mines, to-wit:

Mendha Mine;
Mendha West Extension Mine;
Regent Mine;
Arizona No. 2 Mine;
Chief Mine;
Crown Prince Mine;
Sadowa Mine;
Alaska Mine, and
Mendha East Extension Mine;

Also, the hoisting works, machinery and all other appurtenances connected with said mines, mill and premises.

Said property is known as the Mendha Mill and Mines.

Terms of Sale—Cash in U. S. gold coin; ten per cent. on fall of hammer, balance on confirmation by U. S. District Court.

For particulars respecting this property apply to the undersigned, at their respective places of business, and to J. M. SEIBERT, Agent of Wells, Fargo & Co., at Pioche, Nevada

Dated San Francisco, September 17, 1874.

WILLIAM A. SCOTT, JR.,
At Wells Fargo & Co.'s, San Francisco.

24v22-3m JOSEPH MOORE, Superintendent.

[Continued from Page 245.]

works well and does not require timhering. Daily rate of advance, 12 feet, the header beiug 10 by 14 feet in size.

UNION CONSOLINATED.—Cross-cutting to the eastward from the msin north drift, on the 1,300-ft. level of the Ophir is heing pushed with all tbe vigor possible.

OVERMAN.—The ore in the north drift on the 1,200-ft, level continues of a fine character and gives great promise of rich and permanent developments.

DANEY.—The quartz and ore in the face of the main west drift on the 400-ft. level shows nndouhted indications of soon reaching the ore vein.

BUCKEYE.—The ores are holding out finely, and continue to furnish the mill with a steady supply of good milling ore.

DARDANELLES.—The timbering at the bottom of the new shaft is completed and sinking actively resomed.

IOWA.—The north drift from the west tunnel is heing repaired, preparatory to a further development of tbe streak of ore struck in it several years ago.

KNICKERBOCKER.—The shaft is down 28 feet below the 700-ft. station which is now opeoed ready to commence drifting for the ledge.

NEW YORK.—The main east drift at the 550-foot station, strnck, during the week, a fine streak of quartz ahout three feet in width. This streak of quartz gives average assays as high as $40 per ton.

CALEDONIA.—The south winze from the 800-foot level has made connection with the west drift from the 900-foot station, furnishing a much-needed ventilation and greatly facilitatiog the work on these levels.

LEO.—The streak of ore in the east cross-cut from the north drift is not quite so wide as it was last week, but is of a fine qnality.

GLOBE CONSIOLNATED.—A large amonnt of ore has been developed io the upper levels and is now ready for extraction.

JUSTICE.—The fatal affray of last Saturday evening, growing out of a change in the Superintendency, temporarily arrested the working of the mioe, hut on Sunday work was resumed in the old Justice works, or north portion of the mine, under the direction of G. F. Kellogg, the new Superintendent.

FLORIDA.—The new shaft is being sunk to tbe east of the ledge and has attained a depth of 335 feet.

NEVADA.—The south tunnel is in 190 feet, the last 8 feet is solid quartz and ore, a considerahle portion of which is fair grade.

Arizona.

ITEMS.—Arizona *Citizen*, Oct. 3: Mining activity continues noticeahle. D. C. Thompson is in full chsrge of the Oro Blanco, with his family at the works.

C. O. Brown, lately returned from the Oro Blsnco, and on Thursday he and E. M. Pearce started for the Quacharty and other mines out that way. David Shultes was here early in tbe week. He says the great drawhack to his work on the Quacharty, is the want of water, but that he is determined to remedy hy finding it.

Judge McCarty and D. A. Bennett returned, since our last paper was printed, from the Ostrich gold mioe near the Oio Blanco. Work is going on there, but the Judge thinks more development ought to have been shown for the labor bestowed. It is nothing new to hear of much hard labor heing practically thrown away hy had judgment in the manner of its application.

L. J. F. Iaeger, of Yuma, and Hill de Armitt, of Florence, arrived here on Wednesday, and left for their mines to which they are gettiog patents. The mines lie southwest of Tucson and their locality has been fully described in advertisements in the *Citizen*.

The new and costly smeltiog furnaces of the Coronado company at Clifton, have been completed and fires put under them. That district is the scene of the largest mining operation in Arizona.

Idaho.

MINING NOTES — IDA ELLMORE. — Owyhee *Avalanche*, Oct. 10: The shaft is down 26 feet helow the 12th station. When the 13th station is reached it will be 1,146 feet deep. The ledge will then be cut at the 11th, 12th and 13th stations, which will open up 350 feet of ground all at once.

MOHOGANY.—The maiu shaft is down 70 feet helow the 9th level station, and it is expected to reach the 10th by the first of next month. The 8th aud 9th level drifts south still continne to be pushed ahead in good ore.

SILVER CORD.—The 2d aud 3d level atopes are still running on splendid ore, some of which ia extraordinarily rich. The winze being sunk to open up the 4th level, is now 110 feet, carrying good ore all the way and getting richer as depth is attained.

SOUTH EMPIRE.—Jas. Munroe & Co. have just had 44 tons of ore from this mine milled, and we understand it paid handsomely. This ore was taken out hy four men in six weeks. The average width of the ore is about 20 inches. The South Empire hids fair to make a splendid mine.

Oregon.

MINING ITEMS.—*Oregonian*, Oct. 10: Aoother silver mioe discovery at Hope is reported. A party of three men have started to prospect for gold on the Marshall creek, a tributary to the Nesquatly. This creek is situated about 40 miles from Olympia, and it is reported that gold has been found there in paying quantities.

A LETTER from Rye valley, Baker coonty, says: Bnsy times at present in this valley; everyhody preparing for winter; clesning out ditches and repairing races for the spring campaign of mining; considerable excitement on tne quartz qnestion. Len Adams is still running his arrastras with rock from the Mormon hasin; Gilchrist & Davidson are still ponnding away with their mill, with good results; Porter & Son have finished huilding their arrastras, and are grinding some rock, but water is very scarce with them. Green & Co. are at work huilding their mill; Scott is at work on his new discovery; Davis & Durkee have sunk a shaft 40 feet in depth on their ledge, and it prospects hetter the deeper they go. New discoveries are heing made every week.

Late News.

THE Union Pacific and Kansas Pacific Railroads have entered into an agreement to prorate on all passenger and freight business.

VANDERBILT AND THE RAILROADS.—Commodore Vanderhilt does not take a cheerful view of the railroad ioterests. He recently said to a reporter: "If I was only clear of railroad interests I would never put another dollar io them, and I hope to live sometime yet."

POLITICAL.—The estimated Republican majority at the late election in Iowa, is 40,000; in Nehraska, 1,000. The Democratio majority in Ohio is set down at 15,000; in Indiana, from 1,000 to 1,500. Arkansas has ratified the new Constitution.

THE POST OFFICE DEPARTMENT.—The expenses of the post-office departmeot for the present yesr over those of last year were $3,041,468. The increase of revenue during the same period has heen $3,474,330. The total receipts for the year were $26,471,071.

THE STRANDED "ALASKA."—Advices received by the officers of the Pacific Mail Steamship Company represents that the steamship *Alaska* stranded, io the late typhoon on the China coast, had not heen released from her perilous position up to latest reports.

THE ROSS LIBEL SUIT.—The libel suit of Christian Ross (father of the kidnapped boy), against the Reading *Eagle* has resulted in a verdict against the defendants, the jury beiog out only a few moments. A motion for a new trial was made, and the defendsnts admitted to bail.

TROUBLE BETWEEN CHINA AND JAPAN.—Telegraphic advices from Japan received at the Navy Department and dated September 4th, state that the difficulties between that country and China were still unsettled, and hoth parties were concentrating their forces on the Island of Formosa at strategic points on their respective coasts. A settlement of the difficulty is thought to depend on the result of the negotiations of the Japanese Emhassadors at Pekin.

THE AUSTRALIAN MAILS.—Postmaster Coey is officially informed that at the reqnest of the Government of New Zealand, the use of the San Francisco ronte for the transmission of mails from Great Britain to New Zealand has been temporarily discontinued, and that all mails for that Colony will, uotil further notice, be forwarded by the Suez and Melhouroe ronte. The mails for New South Wales and the other Anstralian Colonies will continue to be forwarded from the United Kingdom for dispatch via San Francisco.

CONDITION OF THE CROPS THROUGHOUT THE COUNTRY.—The Octoher returns of the Department of Agriculture indicate an average condition of the crop to be 86 per cent. in Septemher. All the New England States show an improved condition, exeept Main and Connecticut, aod the Middle States show a decline. The South Atlantic, Coast and Gulf Statea will ahout hold their owo, except Louisiana, where the average decreasea from 76 to 69. Of the Southern inland States Tennessee and Weat Virginia show considerahle improvement. Arkanaas and Kentucky are almost stationary. North of Ohio the condition of the crops was more favorahle in Michigan, Indiana and Illinois, which show rising averages. Wisconsin declined four per cent. Weat of the Mississippi and on the Pacific Coast all the States show an improved condition, except Oregon, which remains the same. In the States afflicted with the grass-hopper plague, a considerable improvement upon the low averages of last month is manifest.

GRANGERS IN THE UNITED STATES.—The publication of 25,000 additional volumes of Agricultural Reports for 1872 is now in progress and will be completed in ahout two weeks. From authentio sources it is ascertained that the number of snbordinate Grangea of the Order of Patrons of Husbandry, on the 1st inst., was 20,800. The increase of new Granges during the month of September was 409, which is several hundred less than for the corresponding period last year. In fact, for several months past, the number of subordioate Granges established has fallen off considerably since last year, owing to the fact that Grangers have been eatahlished in nearly every county in the United States. The number of Grangers in the United States is eatimated at 1,500,000. The States haviog more than 1,000 subordinate Granges are as follows: Iowa, 1,513; Kentucky, 1,425; Kansas, 1,350; Ohio, 1,031; Tennessee, 1,003. The next session of the National Grange will be held at Charleston, Sonth Carolina, on the first Wednesday in February.

FIRES.—Several destructive fires have occurred in different parts of the Eastern States dnriog the past week, among which may be mentioned the destruction of the Baltimore Opera House on Monday night, with a loss of $80,000, and the salt mill and packing house of Barkns & Co., at Syracuse, New York. Loss, $100,000.

THE ballooning folly in tbis city has finally come to a tragic termination in the desth of young Buislay. It is fortunate that hut one life has been sacrificed. It is to he hoped that we have seen the last of it, for the present at least, in this city. As prosecuted here it has served no useful purpose whatever, either practical or scientific.

From an Inventor.

The following letter, which was recently received from an old client of Dewey & Co., now residing in one of the Eastern States, speaks for itself, and will do more, perhaps, to convince inventors of our capacity for business than any nnmher of locsl oompliments. We extract as follows:

GENTLEMEN: It was through your house that I secured my first patent, and although I have since done business here in the Atlantic States with the ableat patent solicitors—gentlemen who have done me justioe—yet I have often regretted that you were too far off to advise with me in my cases. It has taken a longer time with every patent I have taken out since I left California and came East, than in the cases you prepared for me in San Fraocisco, which is certainly very creditahle to yon.

By the way, one of my patents has passed the ordeal which is the essential test of a patent's value. I mean that of a trial in the courts, and it atood the hattling of one of the best lawyers in the couotry. Tbe specifications and claims were completely made out and there was a perfect comprehension of its principle dnring the trial. Since giving it this test we thought that we would make it even stronger, if possihle, and submitted it to one of the hest patent solicitors for advice. After a careful examination of the case he advised us to let it alone as it stood, saying that whoever made up those papers understood their business. I then informed him that they were drawn np by Dewey & Co., of San Francisco, and he replied that he koew you well hy reputation. * * * * * Very truly yours,

L. L. SAWYER.

Meriden, Conn., May 16, 1874.

STARTED UP.—Work has heen resumed on the main shaft of the North Utah mine, on the Comstock.

WELLS, Fargo & Co. shipped $112,695.59 in hullion from Austin during September.

PATENTS & INVENTIONS.

A Weekly List of U. S. Patents Issued to Pacific Coast Inventors.

[FROM OFFICIAL REPORTS FOR THE MINING AND SCIENTIFIO PRESS, DEWEY & OO., PUBLISHERS AND U. S. AND FOREIGN PATENT AGENTS.]

By Special Dispatch, Dated Washington, D. C., Oct. 13th, 1874.

FOR WEEK ENDING SEPT. 29th, 1874.*

CARTRIDGE FOA EXTERMINATING BURROWING ANIMALS.—Lysander Collins, Alma, Cal.

———*The patents are not ready for delivery by the Patent Office until some 14 days after the date of issue.

NOTE.—Copies of U. S. and Foreign Patents furnished hy DEWEY & Co., in the shortest time possihle (by telegraph or otherwise) at the lowest rates. All patent business for Pacifio coast inventors transacted with perfect security and in the shortest time possihle.

Our Agents.

OUR FRIENDS can do much in aid of our paper and the cause of practical knowledge and science, hy assisting Agents in their labors of canvassing, hy lending their influence and encouraging favors. We intend to send none but worthy men.

L. P. MoCARTY—General Agent.
W. H. RATTENBERRY—Californla.
CHAS. W. OTIS—Contra Costa County.
CHAS. T. BELL—Alameda, Santa Clara and Santa Cruz Counties.
J. W. ANDERSON—Orange and Santa Ana, in Los Angeles Connty, Cal.
HOON ALSTON—San Luis Ohispo, San Bernardino and San Diego Counties.
JAS. KEARNEY—Amador, Calaveras, Tuolumne and Mariposa Counties.
B. GOONWIN—Sacramento County.
S. G. CRAWFORD—Nevada, Sierra and Plumas Counties.
J. G. KELLEY—For Washington Territory.
B. W. CROWELL—California.
F. B. ALDERSON—Nevada.

ANAHEIM, July 30, 1874.

MESSRS. DEWEY & Co.—*Gentlemen:* Owing to temporary absence I have heen unable to acknowledge the receipt of Letters Patent for my "Transplanter," up to this time. I take this opportunity to hear witness to the efficient manner in which everything connected with your Patent Agency is conducted, and also the uniform courtesy and kindness I experienced at your hands. I mean to advertise the "Transplanter" in the PAOIFIO RURAL PRESS. Yours respectfully,

TIMOTHY CARROLL.

CAMPO, SAN DIEGO Co., CAL., July 3d, 1874.

MESSRS. DEWEY & Co.—*Gentlemen:* To-day I received the patent and other papers of my animal trap, that you so successfully worked through the patent office for me, for which please accept my hest wishes. The chances are that I will have another application for you to make for me before long. I am well satisfied with your manner of doing business, and I think inventors of this coast stand in their own light when they do not put their business into your hands.

I remain yours truly, A. M. GASS.

Fourth Year of the Pacific Rural Press.

The puhlishers of this journal design making its weekly issnes during its fourth year (1874) still more acceptahle and valuahle than those of the past.

A Farmer's Paper Always.

The RURAL PRESS—established Jan., 1870, has been thoroughly a farmer's paper—"first, last, and always." Its success in popularity and rapidly increasing circulation has exceeded that of any other weekly on the coast.

Neither Politice or Creede.

We refer with satisfaction to the independent, chaste and useful character of our reading matter and the absence from our columns of questionable and demoralizing advertisements.

We shall strive to make it an ever welcome visitor to those who desire to constantly

Improve the Heart and Mind,

And shall give a larger space to our HOME CIRCLE department, which from the first has heen a popular feature of the RURAL.

Our aim is to gather information from all reliable sources, in the varied forms in which it is to he obtained. Our work is to divest our gleanings of all superfluities; condense such information as is of most importance to our special class of readers—give it to these in the plainest and fewest words possihle,—saving *heir time* hy *our labor*.

Our Leading Departments

Will be continued under the following heads:

The Home Circle,	The Horse,
Young Folk's Column,	The Swine Yard,
Short Stories,	Sericulture,
Home and Farm,	The Vegetable Garden,
Useful Information,	The Flower Garden,
Domestic Economy,	The Vineyard,
Good Health,	The Orchard,
The Dairy,	Tropical Fruits,
The Apiary,	Small Fruits,
Poultry Notes,	The Cereals,
Horned Stock,	Pasturage, etc.,
Sheep and Wool,	Fertilizers,
Goats,	Miscellaneous.

Practical Farmers

Know how important it is that the above subjects should he treated from a local standpoint—that generally the farming tactics of the East will not do for this coast; that agriculture, in its infancy here, can derive greater henefits from an exchange of experience through the columns of the press than in older fields. Constantly observing and studying developments in the special field we represent, we can he expected to give truer information on agricultural subjects, than more general writers at home or abroad.

Our Traveling Correspondents

Will do much service hy gathering a largo amount of interesting information from various parts of the Coast, which, hut for their research and practiced observation, might never he placed on record or reach the eye of the reading public. Of our many

Local Correepondents

We have particular reason to he proud. No paper on this Coast—old or new—has ever heen so highly favored with volunteer contributions. They are talented, reliable, independent and generous representatives of an intelligent and enterprising people, noble types of good humor, unselfishness and true progress.

Short Stories,

Original and selected, will hereafter appear in each number. Their selection, we trust, will he such as to render them popular and unobjectionable to all. In addition to a large number of

Fine Engravings,

Representing Choice Stock, Farm Products, Scenery, Remarkable Productions, Improvements in Farming Implements and Machinery, Works of Art and the Beautiful in Nature, we shall from timo to time present the modest

Faces of Prominent Farmers

Who, as pioneers in the development of agricultnre on this Coast, or as active laborers in the "Farmers' Cause," are worthy of the distinction they enjoy, and the favor with which they are looked upon hy our many readers at home and ahroad.

Engravings (costing thousands of dollars originally) are inserted in our columns during a single year. They afford instant and perpetual impressiona often more derfect and real than words can convey.

Patrons of Husbandry.

We shall continue to give our weekly summary of matters connected with the interest and progress of this growing and important movement. We shall aim to give information as fresh as possihle in this department. Its readers are aware that the RURAL has heen in the lead in calling farmers to organize. We shall continue to work zealously with the Granges for the nohle objects of the Order.

The present is an

Important Period

In the history of our Coast. The coming 12 months promise greater developments in its agricultural progress than have heen experienced in any previous year. Agriculturists are alive to improvements in every direction, and those who would keep up with the spirit of the times should certainly read the RURAL PRESS.

The S. F. Market Reporte

Will receive greater attention in the department of DOMESTIO PRONUCE than that of any other weekly journal. We shall spare no pains to render the reports as reliahle and complete as possihle. By the employment of our special reporter we hope to make this very important part of our paper one of its hest and most satisfactory features.

Kind Words and Acts

Have done much to huild up in this isolated and sparsely settled coast so large and complete an agricultural journal as the PAOIFIO RURAL PRESS. We commence the new year with a regular circulation of

Over 5,000 Copies,

A far greater issue than that of any weekly on this Coast, independent of a daily publication. If our friends will continue to "help us help ourselves," we hope to reach a circulation of 8,000 this year, and do a correspondingly greater service of good. While we have the greatest advantages and can make hy far the hest weekly for

Agriculturists on This Side of the Continent,

We cannot expect one-half so large a circulation as jonrnals in older and more populous districts. Consequently readers cannot rightly expect such a paper here at Eastern rates.

No Premiums But a Good Paper

Do we offer. A flashy chromo (or cheap map), with an ill suited paper, will hardly satisfy the farmers of this Coast, whose time is too precious for trifling. To many of you the henefit of a reliable and valuable paper should reach a hundred fold its cost, while to all a poor journal would he dear at any price.

Sample Copies Furnished Free

On receipt of stamp for postage.

Agents are Wanted

Who will do more or less active canvassing. To such we will furnish free samples and pay liherally for their services.

Terms of Subscription:

One year (payable in advance) $4.00
Six months 2.25
To Granges and Farmers' Clubs, furnishing club lists, $3 per annum.

DEWEY& CO., Publiahers,
Office, No. 224 Sansome street, San Francisco.

GENERAL MERCHANDISE.

WEDNESDAY M., Oct. 14, 1874.

There have been few changes during the week. Coffee will doubtless be shakenby the result of to-day's sale. Sugar is dull. Tea is dull, and will be rendered still more so by the next great sale. Rice is dull; so are Candles, at least Eastern. Iron manufactured has dropped ¾c ₱ lb, as also Pig Iron, which is now selling to arrive at $39@40, a reduction. English Chemicals are ½ to ¾c less than the previous week. Clak Claret has declined and is now as low as $46. Absinthe has advanced to $15.25@16, and Medium Cal. Bacon, ¾c. Table Fruits sustain the advance of 25c noted last week. Hardware is dull; Nails have declined to $4.25 jobbing: Domestics are unsatisfactory; Foreign Dry Goods have been very satisfactory; Boots and Shoes sell well; Clothing is dull; Drugs are dull.

To Mining Secretaries.

An amendment to Section 336 of the California Code, taking effect **July 1st, 1874**, provides that in addition to the regular publication of the assessment and sale notices as heretofore,

PERSONAL NOTICE

Must be served as provided in the following quotation from the law:

"The notice must be personally served upon each stockholder, or in lieu of personal service, must be sent through the mail, addressed to each stockholder at his place of residence, if known, and if not known, at the place where the principal office of the Corporation is situated."

The above refers to the ASSESSMENT NOTICE only. Advertisers in the MINING AND SCIENTIFIC PRESS will be furnished with copies of assessment notices printed on slips suitable for serving personal notice under this law at short notice.

DEWEY & CO., Publishers.

June, 1874.

Mining and Other Companies.

Black Mountain Coal Mining Company—

Location of works, Santa Cruz County, State of California. Location of principal place of business, City and County of San Francisco, State of California.

Taylor Mill and Mining Company--Location

of principal place of business, City and County of San Francisco. Location of works, Garden Valley Mining District, El Dorado County, Cal.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 21st day of September, 1874, an assessment of twenty-five cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary, at the office of the Company, No. 607 Montgomery street, in the City and County of San Francisco.

Any stock upon which this assessment shall remain unpaid on the 28th day of October, 1874, will be delinquent, and advertised for sale at public auction, and unless payment is made before, will be sold on Monday, the 23d day of November, 1874, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

SAMUEL S. MURFEY, Secretary.

Office, No. 607 Montgomery street, City and County of San Francisco, California. sep25

The Mining & Scientific Press,

Started in 1860, is one of the oldest weekly journals now published in San Francisco. It has been conducted by its present proprietors for ten years, during which period it has been repeatedly enlarged and constantly improved. The active and steadfast efforts of its publishers have gained for its conduct an amount of practical experience greater than any other publishers have accumulated on this coast, of a weekly journal.

The sum paid by us for the best editorial talent obtainable for our special class journal; for engravings, for interesting news and correspondence, and for printing a large-sized, handsome sheet, is unequalled by that of any other American weekly west of the Mississippi.

As a PRACTICAL MINING JOURNAL it has no rival on this Continent.

It is the only MECHANICAL, and the only SCIENTIFIC journal of the Pacific States.

Miners, Assayers, Millman, and Metallurgist in the United States should take it.

Pacific Coast Mechanics, Engineers, Inventors, Manufacturers, Professional Men, and Progressive and Industrial Students should patronize its columns of fresh and valuable information.

Mining Engineers, Superintendents, Metallurgists, Mine Owners and Mine Workers throughout the world should profit by its illustrations and descriptions of New Machinery, Processes, Discoveries and Record of Mining Events.

Intelligent thinkers throughout the land, in high or humble situation, who would avoid literary trash for genuine information, should SUBSCRIBE AT ONCE.

DEWEY & CO.,

No. 224 Sansome street, S. F.

A Good Binder for $1.50.

Subscribers for this journal can obtain our Patent Elastic Newspaper File Holder and Binder for $1.50—containing gilt title of the paper on the cover. It preserves the papers completely and in such shape that they may be quickly fastened and retained in book form at the end of the volume, and the binder (which is very durable) used continuously for subsequent volumes. Post paid, 25 cts. extra. It can be used for Harper's Weekly and other papers of similar size. If not entirely pleased, purchasers may return them within 30 days. Just the thing for libraries and reading rooms, and all who wish to file the PRESS.

Improved Cast and Forged
STEEL SHOES & DIES FOR QUARTZ MILLS.

[PATENTED MAY 26TH, 1874.]

To Superintendents of Quartz Mills and Mining Men Generally.

We guarantee these SHOES and DIES to do the work of four sets of iron and to be at least 10 per cent. cheaper. They are gradually coming into use in all of the principal mills on this coast.

Their advantages over iron are cheapness on first cost, increased crushing capacity, time saved in changing and in setting tappets, increased value of amalgam by absence of iron dust and chippings, and a saving of 75 per cent. in freight. They possess a similar superiority that steel rails do over iron rails. It takes 40 days to fill orders from the manufactory East. Price 20 cents per pound shipped at San Francisco. Terms liberal.

Address all orders, with dimensions, to
CAST STEEL SHOE & DIE CO.,
Room 1, Academy Building, San Francisco.

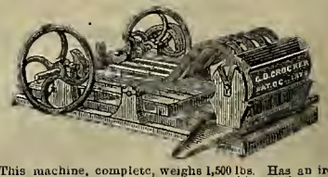
CROCKER'S PATENT
TRIP HAMMER QUARTZ BATTERY.



This machine, complete, weighs 1,500 lbs. Has an iron frame, five steel arms with stamps weighing 17 lbs. each, which strike 2,000 blows per minute, in a mortar provided with screens on both sides, and crushes FINE 600 lbs. per hour, requiring one-horse power to drive it. Has been thoroughly tested, and is guaranteed to give good satisfaction. PRICE, $600.
G. D. CROCKER,
17v26-tf 315 California street, San Francisco.

BALL'S SWEEPING DREDGE,

A NEW AND VALUABLE

CALIFORNIA INVENTION,

Has been very lately well proven by performing a job of dredging at the mouth of San Antonio Creek, at Oakland, Cal.

There is but this one machine that has ever had these improvements employed. It is an old machine, formerly built for another device, and is unfavorably constructed for Ball's improvements; yet this first temporary experimental machine has filled a scow of eighty-five cubic yards in sixteen minutes in unfavorable digging. For durability, digging hard material and fast work, it has a reputation (supported by leading engineers) as having no equal.

Testimonials and references will be given on application to the inventor, who is the sole owner of patents (excepting having made an assignment of the one machine now belonging to the Central Pacific Railroad Company). Having resolved not to sell any rights unless upon a *basis* of actual work performed by a machine built by myself for the purpose of fairly establishing the worth of the invention, I therefore offer to sell machines or rights on the following plan, which is warranting the capacity of the machine by actual work:

I will enter into an agreement with any responsible party to build and sell a machine, scows and tender, all complete, and right of all my improvements in dredging machines throughout the Pacific Coast for $20,000, warranting the machine to dredge six cubic yards per minute (to fill a scow at that rate). $20,000 will but little more than pay the cost of building the machine, scows, etc., all complete; therefore I am proposing to ask *nothing* for my patents unless my machine dredges more than six cubic yards per minute. But it shall be further agreed that in case (at a fair trial to be made within a stated time) the machine shall fill a scow at the rate of more than six cubic yards per minute, then $10,000 shall be added to the price above stated for each and every such additional cubic yard than dredged per minute, and for additional fractions of a cubic yard than dredged in the same ratio the $10,000 is to be added to said price above stated.

I will sell any other Territorial or State rights (either United States or Foreign) upon the same plan and at a lower price proportionately than the rights for the Pacific Coast.

I will sell a single machine with scows and all complete, and right to use the same in a limited territory, for $40,000 on the same plan as above stated, but will add only $2,000 to each additional yard over the six cubic yards per minute. Each machine is not to employ more than two 10x20 inch engines.

Payments to be made in U. S. gold coin on delivery of machine, as may be indicated by agreement.

Address, JOHN A. BALL,
9v28-tf Oakland.

THE SELDEN DIRECT-ACTING STEAM PUMP,

7v25-tf JOHN TAYLOR & CO.

Varney's Patent Amalgamator.

These Machines Stand Unrivaled.

For rapidity pulverizing and amalgamating ores, they have no equal. No effort has been, or will be spared to have them constructed in the most perfect manner and of the great number now in operation, not one has ever required repairs. The constant and increasing demand for them is sufficient evidence of their merits.

They are constructed so as to apply steam directly into the pulp, or with steam bottoms, as desired.

This Amalgamator Operates as Follows.

The pan being filled, the motion of the muller forces the pulp to the center, where it is drawn down through the apperture and between the grinding surfaces.—Thence it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, and to the circumference as before. Thus it is constantly passing a regular flow between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powder, and the metal amalgamated.

Setters made on the same principle excel all others They bring the pulp so constantly and perfectly in contact with quicksilver, that the particles are rapidly and completely absorbed.

Mill-men are invited to examine these pans and setters for themselves, at the office, 229 Fremont Street, San Francisco

Scientific and Practical Books on Mining, Metallurgy, Etc.

Published or issued, wholesale and Retail, by DEWEY CO., MINING AND SCIENTIFIC PRESS Office, S. F.

BY GUIDO KUSTEL,

MINING ENGINEER AND METALLURGIST.

Roasting of Gold and Silver Ores, and the Extraction of their Respective Metals without Quicksilver. 1870.

This rare book on the treatment of gold and silver ores without quicksilver, is liberally illustrated and crammed full of facts. It gives short and concise descriptions of various processes and apparatus employed in this country and in Europe, and explains the why and wherefore.

It contains 142 pages, embracing illustrations of furnaces, implements and working apparatus.

It is a work of great merit, by an author whose reputation is unsurpassed in his speciality.

Price $2.50 coin, or $3 currency, postage free

Concentration of Ores (of all kinds), including the Chlorination Process for Gold-bearing Sulphurets, Arseniurets, and Gold and Silver Ores generally, with 120 Lithographic Diagrams. 1867.

This work is unequaled by any other published, embracing the subjects treated. Its authority is highly esteemed and regarded by its readers; containing, as it does, much essential information to the Miner, Mill man, Metallurgist, and other professional workers in ores and minerals, which cannot be found elsewhere in print. It also abounds throughout with facts and instructions rendered valuable by being clearly rendered together and in simple order. It contains 120 diagrams, illustrating machinery, etc., which alone are of the greatest value. PRICE REDUCED TO $5.

Nevada and California Processes of Silver and Gold Extraction, for general use, and especially for the Mining Public of California and Nevada, with full explanations and directions for all metallurgical operations connected with silver and gold from a preliminary examination of the ore to the final casting of the ingot. Also, a description of the general metallurgy of silver ores. 1864.

As its title indicates, this work gives a wide range of information, applicable to all vein miners and workers in precious metals, affording hints and assistance of exceeding value to both the moderately informed and the most expert operator.

Price, $5 in cloth; $6 in leather—coin.

BY OTHER AUTHORS.

The Quartz Operator's Hand-Book; by P. M. Randall. 1871. Revised and Enlarged Edition. Cloth bound, 175 pages. Price, $2.

Sulphurets: What They Are, How Concentrated, How Assayed, and How Worked; with a Chapter on the Blow-Pipe Assay of Minerals. By Wm. M. Barstow, M. D.; 1867; cloth bound, 114 pages. Printed and sold by DEWEY & Co. Price, $1; postage free. The best written work, and most complete work on the subject treated.

ANY OTHER BOOKS DESIRED will be furnished at the most reasonable rates by DEWEY & Co., Mining and Scientific Press Office, S. F.

Fifth and Last Gift Concert

IN AID OF THE

PUBLIC LIBRARY OF KY.

DRAWING CERTAIN ON

NOVEMBER 30th, 1874.

$2,500,000 IN GIFTS.

100,000 TICKETS! 20,000 GIFTS.

This is the last Concert of the series. Four have already been given and nearly Two MILLIONS AND A HALF distributed among the ticket-holders. In the First Concert the principal gift, of $35,000, was drawn by John R. Durff, of Memphis, Tenn., now a resident of New Albany, Ind. In the Second it amounted to $75,000, and went to a club at Columbus, Ind., gotten up by Mr. T. C. Burgess. In the Third Concert, the first gift of a $100,000 was drawn by Mr. L. H. Keith, of Kingston, Mass. In the Fourth Concert, Memphis was again the lucky holder of the ticket which drew the Capital Prize of $187,500, which was distributed among various clubs and individuals in that city.

In the Fifth and Last Concert, which comes off on 30th November next, the principal gift will be $250,000 and it waits only the turning of the wheel of fortune to ascertain the fortunate possessors of the lucky numbers which will entitle the holders to such fortunes as $250,000, $100,000, $75,000, $50,000, $25,000, &c. Twenty thousand gifts, from $250,000 down to $50, will be distributed by lot among the ticket-holders.

Whole Tickets, $50; Halves, $25; Tenths, $5; 11 Whole Tickets, $500.

The time is fixed and near at hand. This is the last chance for easy fortunes, and those who want to avail themselves of it have no time to lose.

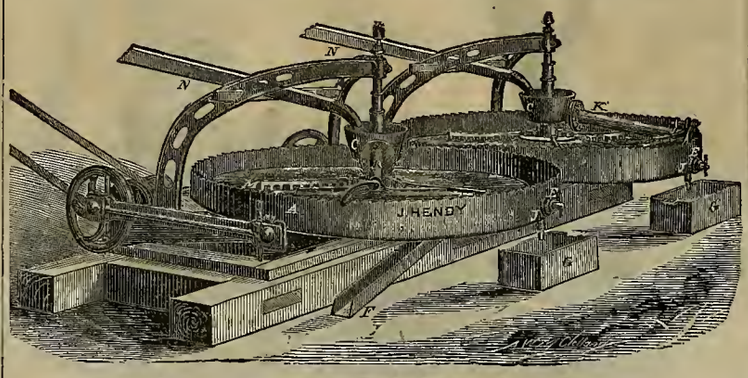
SCIENTIFIC PRESS.—The attention of our readers is called to an interesting article on the Mining Interests of Northern Sierra, on the first page of this issue, from the SCIENTIFIC PRESS, San Francisco. This is the ablest, most instructive and influential Mining Journal published in the Great West, and should be liberally patronized by all our mining friends.—*Mountain Messenger*, April 25.

OVER $3,500 PER MONTH SAVED

BY THE USE OF

Hendy's Improved Amalgamator and Concentrator



Can be seen at the Manufactory, No. 32 Fremont Street, San Francisco.

SAN FRANCISCO, April 27, 1872.

JOSHUA HENDY, Esq.—*Dear Sir:*—As a practical miner and millman, I take pleasure in recommending the use of your Concentrators in all mills where gold or silver ores are reduced. No mills should be without them, for the following reasons:

1st. They are good sizers (no perfect concentration in pulverized ores can be effected without first sizing).

2d. The best Concentrator I have ever known—(the concentrated stuff only containing 5 per cent. of sand).

3d. They are good amalgamators, light (feathery) particles of amalgam and particles of coated gold by attrition are brightened, and from their specific gravity and the action of the pan, fall to the bottom and adhere.

4th. They require but little power and attention to run them, and with ordinary care will last for years.

I have been familiar with the workings of your Concentrators for four years past; have run them myself in the North Star Mine, Grass Valley; am familiar with their practical workings on the Empire Mine, Grass Valley; St. Patrick, Placer Co.; St. Lawrence, El Dorado Co.; Oaks and Reese, Mariposa Co., and most cheerfully give you this testimonial. For further information you are at liberty to refer to,

Yours respectfully,
JAS. H. CROSSMAN, M. E.

409 California street, or Cosmopolitan Hotel.

SAN FRANCISCO, February 10, 1874.

OFFICE SUPERINTENDENT OF KEYSTONE CON. M. CO., AMADOR, AMADOR COUNTY.

MR. J. HENDY—*Dear Sir:*—In answer to your inquiries as to your Concentrators furnished our company last July, I would say that I am more than pleased with them; and the saving to the company has been over $3,500 per month more than with the blankets and huddles formerly in use. C. O. HEWITT, Supt.

OFFICE SUMNER MINE, KERNVILLE, April 27, 1874.

J. HENDY, Esq.—*Dear Sir:* Having four of your Concentrators in use at our Mills for four or five months, which for saving Amalgam and for concentrating Sulphurets, are a success, beyond a doubt, I feel it a duty due you and those interested in Quartz Mills, to recommend them.

As further evidence of their worth, I now order TWELVE more of your Machines for our new Mill, now in course of erection. E. R. BURKE, Superintendent.

For description send for Circular.

JOSHUA HENDY, San Francisco.

Cazin's Combination Ore-Sizer and Concentrator—One Plunger System.

[Covered by Letters Patent of July 2d, 1872, and recent applications.]

Containing a sizing apparatus, (revolving screen) delivering two or four sizes of ore to two or four rows of sieves, each row independent of the other, and each having 5 sieves, each row concentrating according to specific gravity the special size automatically fed unto it, resulting in the simultaneous continual delivery of separated materials, working 2d and 3d-class ores into 1st-class ores of perfect cleanness. It thoroughly separates native gold or copper from quartz or any other lode matter;—galena and silver sulphurets from pyrites, baryta and quartz; and pyrites from quartz.

Added to a battery of stamps these machines constitute a full system of ore concentration, sufficient in most cases for the requirements of western mines, with a capacity of 15 or 20 tons per 24 hours.

For particulars apply to,

VOLUME XXIX Number 17.

Mill Building.

A large flour mill is shortly to be built by the Astoria Milling Co. in Oregon, on the plan patented by Mr. D. Bsquette some time aince. Mr. Bequette'a method of mill building ie somewhat novel, and the general idea may be seen by the accompanying cut. It is necessary of course in building a flour mill, to gain altitude, as the machinery can be placed to better advantage and the expenae of the same reduced.

In Mr. Bequette's plan the building ia 110 feet aquare at tbe baee, towering to a hight of 82 feet, ia seven storiee, each atory being lesa in size than the preceding one, as followe: First floor, 110 feet sqnare; second floor, 90 feet sqnare; third floor, 70 feet square; fourth floor, 50 feet equare; fifth floor, 30 feet sqnare; sixth floor, 30 feet equare; eeventh floor, 10 feet aquare. Upon the top is placed a water tank. The roofing makes the fonr walle equal, leaving an offeet at each story aufficient to afford light enough for each one of the rooms. Beginning with the foundation, on the first floor there are twelve rows of poete, twelve poets in each row, ten feet from centers. The outside row ie placed aa bracee, toward the center, on top of which a plate ie framed to receive the bottom of the first rafters. On the ten inside poet are placed ten beame in two equal pieces—upon the firet half of which heam is placed an equal number of ties, let into the lower and upper halvee locking each beam on top of each poet, making a rack, hraced by the roof from the outside toward the center. The joiets are apiked in the bottom of each post, and so each etory is continned, in the eame manner, with the exception of the size of the timber, which is reduced as each atory is carried upwards.

To what advantage machinery can be placed in a building of thie kind ie apparent. It takes less room, and each part can he placed in proper position—that is to say, very near the first moving power, thus producing a constant tendency to eqnilibrium, an important matter in all machinery requiring great velocity, as the greater the dietance from the first moving power, the greater the resistance to motion. For steam power it ia necessary to have the first moving power—that ie to say, the wheel that is hnng on the fly wheel shaft—made large and heavy, as it will partly act aa a fly-wheel and tend to keep the ehaft steady. This is placed on the center line of the first floor, and the fly wheel runs parallel with the heama in Mr. Bequette'e plans; its mate, or the leading wheel, being heavy, with an upright shaft to the firet bearing, from which shaft the hurre are belted and also the npright ahaft runs to the bolting reels, from which the lighter machinery above is geared and belted, inclnding the elevator, conveyor and hopper boy, which performs nearly every necessary movement of the grain and flour from one part of the mill to another, or from one machine to another, through all ita varione operations, from the time the wheat is emptied from the wagoners' or cars' sack, or from the hold of barge or eteamer, nntil it is manufactnred into flonr.

The wheat is received and elevated to the top floor. From thence through the varioue cleaning machines it is conveyed to the stock-hopner on the third floor, above the mill stones. The holting ohest ia alao placed on third, running parallel with the beams. The hurra are placed on the second floor, and upon this floor the packing ia done, and the flour finds its way through shntes to the vessel, ready for any part of the world, as has been tested by Oregon flour now on the Middlesex, which was taken from Oregon thirteen monthe ago on that veseel, has passed aeveral timee through the topics in eacks, heen to Liverpool, hack to Australia, and is still as aweet aud pnre as when it left Astoria in 1873.

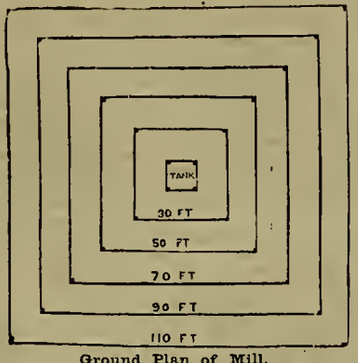
The company that ie to build thia mill at Aatoria have 2000 feet water frontage and will carry on the flour and timber business both They will commence the building on the 1st of next April.

The Consolidated Virginia mine shipped 38 bars of bullion worth about $125,000 on Saturday evening to the Carson Mint for coinage.

Academy of Sciences.

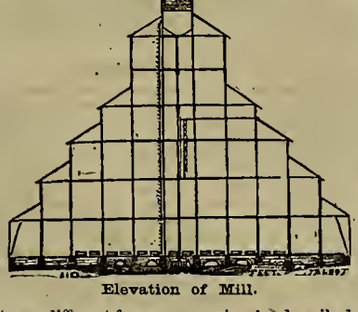
The regular eemi-monthly meeting of the California Academy of Science was held on Monday evening last. Vice President Hewston in the chair. Messrs. F. Grnber and Geo. T. Bromley were elected reeident members.

The donations to the museum were ae follows: Fifteen specimens of coal, including all



Ground Plan of Mill.

varieties found on this coast, and also Australian and other foreign specimens, presented by James P. Dameron; section of a geode, containing oryetala of carbonate of lime, presented by D. D. Colton; epecimens of wood and fruit of the oeage orange, presented by R. K. Reid; also from the same gontleman, specimen of walnut wood, a native of the lower Calaveras; two skates' eggs, found near Point Loboe, by W. G. Blunt; ores from the different quickeilver mines in Napa county, by J. W. Lynch; materiale showing the dye from the wood of the osage orange, by Charles D. Gibbes; one specimen of silver ore from Arizona, three specimens of silver ore from the Rocky Mountains, and cryetals of zinc blende, by Governor Samuel Purdy; skull, euppoeed to be that of an Indian female, found nnder fifteen feet of clay in the bed of the San Francisquito creek, San Mateo county, presented hy Hunter & Shackelford; small handed enake, species unknown, from Northern California, preeented hy Paymaeter Stanton, United Statee Navy; two specimene of crustacea, genue *squilla*, from Shanghai, presented by Henry Edwarde; a parasite from the California orange



Elevation of Mill.

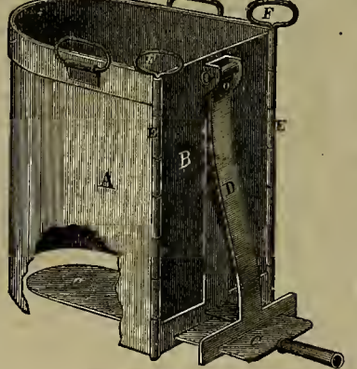
trees, different from any previously described, presented by Dr. Behr.

Dr. Cooper made some verbal remarks on California in the miocene epoch, which we give in another column of thia ieeue.

J. P. Dameron read a paper on "coal."

Dr. Blake deecribed a remarkable electrical phenomenon witnessed by him, at Placerville, during the prevalence of a severe thnnderetorm, on the 13th of September. A brilliant corruscation, resembling the aurora, arose from the ridge of the mountains, six miles distant, and continned steadily for fifteen to twenty minutes, when it gradually faded away. The storm was raging in the valley at the time, but on the mountain the weather wae clear, and the appearance wae probably prodnced hy a silent discharge of electricity from the ridge. The phenomenon snrpaseed any electrical disturbance he had ever witnessed before; but it is reported that a eimilar pbenomena are not unfreqnently noticed in tho rainless regions of South America.

Dr. Dall, of the U. S. Coast Snrvey, who returned last week from a eix months' expedition on the coast of Alaska, gave a brief acconnt of a few general reeulta: The seaeon in the Arctic regione has beeu an open one and exceedingly auepicious for observations. The expedition haa passed a greater portion of the time in the vicinity of Mount St. Eliae. The scenery of that region wae euhlime beyoud description, and the greateat glacicre were found there existing outside of the Polar seas. Much attention has been given to measuring the altitude of Mount St. Elias and the neighboring peaks by careful triangulations, and it was determined beyond douht that St. Elias is the most lofty point of land on the North American continent. Ite altitude is calculated at 19,000 feet, and that of Mount Fairweather at 15,000. It ie imposeible, however, to fix tbe preciee hight of the lofty peaks until their aecent can he accomplished. Monnt St. Ebas haa been commonly designated in tbe geographies as a volcanic cone, but an examination of its formation as far as practicahle determined that this supposition ie erroneous. Small volcanic vente are diecovered, however, toward the sea. While sailing close in to the ehore, a few milcs north of Cape Fairweather, an immenee glacier was inspected, having a flow



Device for Moving Plants.

from three to six milee in width, and extending inland beyond the reach of vision, which wae at leaet thirty miles. The country wae of a rolling formation and no material deviations appeared withiu the horizon in the direction of the glacier. The ice wae clear and blne and glistening in the light, aud presented a magnificent spectacle.

A paper by Prof. Geo. Davidson was submitted by title, "On the Meeh-knot of the Tchin-cha-an Indians, Port Simpeon, B. C. The knot is used for making nets, and is quite ing enious.

Dr. Harkneee described a microscopic examination of the fungns preeented at the last meeting by Dr. Cooper. He ahowed that the theory of spontaneoua generation wae incorrect.

Mr. Lockington described eome cnrione specimens of crustacea from the Pacific islands and Japan.

C. D. Gibbes made some remarks on the osage orange, which are referred to more at length in another column.

Dr. Dall read a paper on "Aleut Mummies," which will be found eleewhere in this issue.

The big crevice which to the east separates Gold Hill from the mainland ia eteadily widening and lengthening. The openiug is now half a mile long. Gold Hill ia hnilt at the weetern haee of a hill, and the crevice extends around the eaetern base of the same hill. If it could, this hill would like to tnmhle over to the weet.

Senator J. P. Jones, F. M. Pixley, Mark Sheldon, Phil. Weaver and Frank McCoppin have gone on a tour of inepection to the Panamint mines.

Device for Removing and Transplanting Trees.

Timothy Carrol, of Anabeim, Los Angeles county, California, patented last month through the agency connected with tbis office, a device for removing and transplanting treea, which is an improvement on one patented by him last June. The invention conaists in a novel conetrnction of the encloeing case, by wbich it can be employed in removing plants with large or spreading tops or branchee, without disturbing them. The enclosing caee is provided with a strengtbening band at the top, and the arm, througb which the slide passes, is hinged so as to stand at any distance from the side of the caee, or swing up entirely ont of the way.

The accompanying cngraving shows the apparatne. *A* ie the encloeing caee, which enirounds the treo or shruh, and is driven into the ground eo ae to enclose tbe roots and a portion of their surrounding earth. Tbis case is made in an arched form, aa shown. The two sides of this arch are united by a stout armor gate, *B*, which extende acrose between theee sides, and may be hinged in any suitable manner. In the preeent caee, sections are formed to interlock, and the rods, *F*, are paesed through like the pintles of a hinge. Either one or both of these rods may be removed, and the case can be passed aronnd the hody or etalk of the ehrub, when the portion, *B*, can he replaced and the rode, *F*, put back eo that the ehrnh will be encloeed. The ehell, *A*, can then he forced down, and the slide, *C*, at the bottom, pushed in beneath the roote and enclosed earth, and the whole can he lifted hy the bandles and carried to any deeired point.

The top of the ahell, *A*, is streugthened by a etout metallic rim. A plate extends dowu the middle of the gate, *B*, and two lugs are formed near the top, betweeu which the arm, *D*, is hinged. This arm, *D*, has a T-shaped extenaion at the lower end, and through a slot in thie extension the elide, *C*, pasaee, as well ae through a similar extension at the bottom of the plate. Theee two plates gnide the slide, *C*, and a projection, *O*, from the hinged arm, *J*, preveuts it from ehutting too closely againat the aide of the gate, which is thus adjustable, out or in, ae may be required. By taking out the pintle at the top, the arm, *J*, can be entirely removed, after witbdrawing the slide, *C*, eo that the case will take up hut little room. Further iuformation may be derived from the inventor, by addressing as above.

Improved Method of Hanging Windowe.—We saw thia week an improved method of arranging the pulleys in window frames, deeigned by Mr. J. Curle at No. 513 Montgomery street in this city. The arrangement is quite simple and is such that the cords usually in eight are now ont of the way and placed in such a manner that they cannot be eeen. Moreover, ehould the corde get off the pulleys or break, repairs can eaaily he made without the necesaity of tearing down any part of the frame, or even removing the saehes, so that the wood work and paint remain uninjured. Mr. Curle proposea to use galvanized wire rope inetead of cord, as it will last much longer and there will he less danger of hreakage. The cord ie fastened in a groove inside the aaeh at the lower part of the aaeh and passea tbere under a pulley and up over another one. These pulleya are out of sight bnt are so arranged that they can he removed hy means of a ecrew driver and any repairs uecesaary, easily effected. The additional coet of hanging window eaehea on the improved plan is very elight compared with ita advantages. A full aized sash has been made and can he eeen by thoee who desire it at the above address. Builders and contractors who know tbe difficulty met with in repairing the old style saah, will easily appreciate the advantage of this.

The Blue Tent Ditch company, Placer Co., are closing up their operations for the seaeon. About twenty men are employed, putting the work in ahape for the winter. It is expected they will open out next apring with renewed vigor.

CORRESPONDENCE.

Chrome Ore.

EDITORS PRESS:—Perhaps there are but few people better acquainted with the characteristics of chrome ore than myself, having worked in it for several years in Pennsylvania and Maryland, which was then thought to have been the only chrome bearing region of the Union; but the exhaustion of the principal mines there forced the monopolizers to search elsewhere to keep up to their agreements. This induced prospecting in neighboring localities, but their search and labors, however, have been comparatively furtile. Having no other alternative left but California, Tysons of Baltimore came here, and located one and one-fourth mile of chrome land near Crescent City, where they operated for some time, sending some of the ore to Baltimore and some to England. They are now at work again in their old abandoned mines in Pennsylvania and Maryland, which to the outsider is good evidence of a great demand, so they proceed on sand and rock chrome, taking it out wherever found, and sell to those monopolizers for $20 per ton, which proved, when plentiful, a good revenue to the buyer. In a recent issue of the PRESS, I noticed that a company has been formed in California to mine and manufacture chrome ore. Such is the only manner of proceeding successfully in your State, because of the high freight to market.

The rock in which chrome is generally found is serpentine. I have seen it in many places in California. I expected to have met with the ore in Lone Mountain, San Francisco, but have failed in doing so, although the rock there looks favorable for chrome ore. That in proximity to the New Idria mine is very similar to the famous Wood Pit mine in Lancaster county, Pa., where it extended to the depth of 600 feet in a continuous deposit sometimes 50 and 60 feet wide. The ores were generally associated with magnesia, bricite and asbestos. I have found chrome in veins, but always in deposits inclosed by the serpentine rock, gradually at times, and sometimes suddenly leaving no guide whatever for its prosecution. T. S.

Down in a Silver Mine.

A day or two since we took a "run" through some of the upper levels of the Belcher mine. Our particular business on this occasion did not take us below the 1,100-ft. level. We might have gone 400 feet deeper—might have visited the 1,200, 1,300, 1,400 and 1,500-ft. levels—but we didn't. Hank Donnelly, foreman of the mine, who was our guide on the trip, offered to escort us through the steaming regions below, but, as we have said, our business lay above. We do not propose in this article to speak of the ore breasts, rich stopes and chambers, and all that sort of thing; we mean merely to mention some of the sights met with while we were rambling about in the vast cavernous recesses of the upper portions of the mine.

It is not dark and dismal below, as many suppose. The long drifts are lighted up by candles placed at regular intervals. These drifts, and the broader galleries, running in all directions, somewhat resemble the streets and alleys of some old-fashioned, overcrowded village—some village seated in a confined place, where it is crushed out of shape. Our underground streets are not wanting in life. As we pass along the highways and byways of the underground regions we meet with the people of the place at every turn.

There are employed in this one mine between 750 and 800 men, a sufficient number to populate a town of considerable size. Men meet and pass us, all going about their business as on the surface, and frequently a turn brings us in sight of whole groups of them. We seem to have suddenly been brought face to face with a new and strange race of men. All are naked to the waist, and many from the middle of their thighs to their feet. Superb, muscular forms are seen on all sides and in all attitudes, gleaming white as marble in the light of the many candles. We everywhere see men who would delight the eye of the sculptor. These men seem of a different race from those we see above, the clothes wearers. Before us we have the troglodytes—the cave dwellers. Our mind runs back to the time when the human race housed in caverns; nor alone far up the Nile, as the ancients supposed, but in every land, at a certain stage of their advancement in the arts of life. Not unfrequently, while traveling along some lonely passage, we were confronted by a man of large stature, huge beard, and breast covered with shaggy hair, who came sliding down out of some narrow side drift and for a moment stood and gazed curiously upon us as though half inclined to consider us intruders upon his own peculiar domain. On such occasions we would not have been much surprised to see the man before us cut a caper in the air, brandish a huge stone axe and advance upon us with a wild whoop.

Way stations are frequently encountered during our underground travels. These are large rooms fitted up off at one side of the principal drift and usually not far from the main shaft. Here are barrels of ice water, tin dippers and cups hanging about on nails, and probably boxes of candles and other stores. We are always glad to come to one of these stations and go for the dipper without any one telling us that it is a good thing to do. About these stations we always find a number of the Troglodytes. They come for water and stop a short time to hear the news of the mine; for the station is near the main incline, up and down which regularly run trains of cars and which is the Central Pacific of the region and connects the lower regions with the surface. These men gaze contemptuously upon us, as being men, wearing shirts, and then betake themselves to their own peculiar regions along the several streets and alleys leading thereto. On the 1100-foot level we took a "near cut" through the wilderness. This is a place to make the hair stand upon the head of any clothes-wearing man who has not been scalped by nature or art. It covers about ten acres of worked out ground. One sees here something of the great pressure of the superincumbent earth. The large timbers are crushed down, splintered and twisted; chambers originally square are squeezed into a diamond shape and their roofs touch the floor in the center; solid piles of square timbers are pressed into pancakes; winzes and chutes are telescoped; ladder-ways once spacious are crushed out of all shape and now can hardly accommodate a cat—all is confusion confounded—yes, that is just it, confounded confusion! Yet through all this we must find our way. It not a little resembles the track of a tornado in a timber country—What is called a "windfall." When we have a windfall we do not want one of this kind. In places are immense caverns where all the timbers are gone, and great flakes of clay and rock lean out from the walls and composedly look down upon the trembling passer-by. One is afraid to sneeze lest he may bring these down upon his head.

Sociable rats dwell in this fearful region. Sitting down upon some fallen timbers to rest, several of these quadrupedal inhabitants came about. Hearing our voices as we for a time remained stationary, these fellows naturally concluded that we had something to eat, and came to look out for their share. They got up on the ends of the timbers, cocked their heads this way and that, as they gazed inquiringly about. Evidently they did not understand it at all. Why we should be sitting there talking with no dinner pails in sight puzzled them not a little. They always flock about the miners when they sit down to eat, and always get their share of what is going.

A ride on the giraffe was a new experience to us. This "giraffe" of the miners, is merely a large car made to run on an incline track. The wheels in front are low, and those behind high. Thus the body of the car stands as level as that of a car on an ordinary track. This incline stands at an angle of thirty-six degrees, and the track laid in it is of ordinary railroad iron. The car plying to and fro carries about eight tons of ore. At the front is a seat, much the same as the driver's seat on an omnibus. Here is seated the conductor of the train. There is room for three on the seat, and mounted upon it we took our first ride upon a giraffe. The car is drawn up by a heavy wire cable, and it goes up like the—well, like the devil, if we must say it. The timbers on the sides resemble a fine-toothed comb. To look ahead and see before one a hundred yards of steep steel rails, up which you are rushing at whirlwind speed, is the reverse of natural. Up this queer railroad you are thundered through the caverns of the gazing Troglodytes till you reach the bottom of the vertical shaft, when they transfer you to a cage, rush you up a shaft, and shoot you out at the top, as the "Red Gnome" in the play is shot up through the star trap in the stage floor.—*Virginia Enterprise.*

The New York Mine.

This mine is situated on the east side of Gold cañon, to the southeast of, and adjoining the Overman. The title is a U. S. patent. The ledge is what is termed a blind one, although the ridge on which the mine is located is covered with fragments of quartz boulders rich in both gold and silver. Some Spaniards have located in an adjoining ravine, and for a long time have been gathering, breaking and working successfully, in an arrastra, this surface or float ore. The ledge runs in a north and south direction, and is supposed to be the front ledge of the Comstock. The location is certainly a very favorable one, and is on a direct line between the Overman and Woodville mines.

The Hoisting Works

And shaft are situated near the center of the claim, in a very favorable location for working the mine to the very best advantage. The main building is 60x90 feet in size, with a boiler-room 40x60 feet, and carpenter and blacksmith shops adjoining. Several out-buildings have been erected, among which is a bandsome residence and office for the superintendent. Everything is arranged in and about the works with a view to the greatest convenience and economy in working. A large supply of wood and other necessaries for use during the winter months have been purchased and are already at the mine.

The Shaft

Is 700 feet in depth, has three compartments, 5x5 in the clear, and is timbered in the most substantial manner throughout. At the depth of 650 feet a station has been opened and two main drifts run—one in an easterly direction 80 feet, and the other in a westerly course 64 feet, at which point a ledge of solid quartz, two feet thick, was struck. A drift was then started northwest along the ledge, which is now in 23 feet, the vein gradually widening to four feet, the most of which is ore of a fine character. A drift south on the same vein has been run a distance of 20 feet, the ore strsak continuing about two feet in width, and the vein mattsr gradually widening to seven feet, with handsome, well-defined walls. The quartz and ore strongly resemble that found in the Woodville mine, and the appearances are that the top of a fine ore body is being cut by this drift. At the depth of 700 feet, another station has been opened and a drift started to cut the ledge. This drift is in 18 feet, and is expected to reach the ledge in a week or 10 days more.

The Hoisting Engine

And other machinery are all in the finest possible working condition and are calculated to work the mine to the depth of 1,000 feet. The water is drained by three steam pumps, the first being stationed at the depth of 350 feet below the surface, hoists the water to the drain tunnel, which is 50 feet below the surface. The second is placed at the 700-foot station, and the third is kept lowered to the bottom of the shaft as fast as the sinking progresses. The mine is under the able superintendence of Colonel Robert Apple, a gentleman thoroughly versed in all the details of mining operations, who resides at the mine, gives it a close and careful supervision, and will soon make it a paying mine, if good judgment and indomitable perseverance can procure so desirable a result.—*Gold Hill News.*

Eureka County, Nevada.

From the annual report of the County Assessor of Eureka Co., Nevada, published in the Eureka *Sentinel*, we extract as follows:

The daily shipping receipts of bullion, the force employed in mining, the extensive mining improvements, the large number of men employed in producing charcoal, teaming required, and regular quotations of our stocks, not only speak "business," but conclusively show the advantage of investments in this district.

While we admit no great excitements in the advancement of our mining stocks have transpired, no losses have driven the honest speculator to poverty. As staples are quoted, as invoices are bulletined at custom-houses, so are Eureka mining stocks proclaimed to the world.

The Richmond Company,

Under the mangement of Edward Probert, commands no attention at my hand. From the yield of the Richmond mine, the extensive and complete smelting works, the refining or separating works, the improvements at the mine and graded roads, speak for themselves. The word "assessment" is unknown to the stockholder, the word "dividend" he understands, and the punctuality with which his exchequer is replenished from the product of this celebrated property creates no speculative turn to resort to stock hoards, but he rests satisfied with the remittances that accompany the statements of each and every month. The construction of the fume arrester inaugurated the experimental era. The concentrating and gathering of dusts impregnated with precious metals not only pays handsomely to the owners, but noticeably add to the health and comfort of the town.

The Eureka Consolidated

Mining company loses none of its reputation as a bullion producing property. The status of this mining property cannot be assailed. Owing to the flood, heretofore alluded to, the furnaces were rendered unfit for use for some time. Work at the mine, however, was vigorously pushed forward by the superintendent, W. H. Shaw. At the same time the furnaces were rebuilt, new roads were prepared and every convenience necessary to the more thorough and perfect management of the property was looked after. An examination of the works convinces the stockholder and visitor of the good judgment and foresight of the superintendent. The fume arrester lately constructed places the manager at the head of economical and practical men.

The K K Consolidated

It is known to every one, and has the reputation among its friends, the producers and manufacturers of every article requisite in the conduction of a property of this magnitude. The powerful machinery at the mine, required in raising ore from the deep workings, the outside facilities for handling the same, speak well of the management. The Silver West furnace is under lease to this company, and is constantly turning out bullion of high grade. Too much praise cannot be accorded to Professor Keyes, the superintendent of this property, who, by ceaseless exertion, now finds himself in charge of as fine a mine as there is in our district. The quarterly assessment from

Cortez Mining District

Shows a constant increase. The Garrison and St. Louis, is owned by S. Wenhan; the Ironsides and Berlin, owned by James Laraway, are producing ores of high grade, which are easily reduced. Geologists pronounce the mines of this district more permanent than in many of the surrounding districts, giving Cortez a reputation that ought to draw within her limits large capital and the most thorough and scientific management.

Other Mines.

Secret Cañon mining district maintains here reputation in the production of bullion. The Geddes & Bertrand mine is furnishing "hard currency" in sums only to be equaled by other mines of same richness, and managed in the same business-like manner. More work is being carried on at present in Secret cañon mining district than at any other period since the mineral discoveries in this portion of our county. The repairing and starting up of the Pinto mill has infused a new life into the resident miners, and is inviting examinations and investments from abroad.

The British Mill and Mining company, under the supervision of Thomas W. Taylor, is a recognized and important acquisition to the heretofore reducing capacity of the district. Over 25 tons per day of ore are taken from the company's mines, to wit: From the Industry, Emmett, and Connolly, which are being worked and with results highly gratifying to the stockholders. Any success attending the milling of ores will measurably favor the opening of mines producing ores unsuited to smelting. The large developments of ore in

The Hoosac Mine,

And the regularity of the vein as exposed by the application of a most thorough system of mining, warrants the belief that another year will witness mining operations on Bald Mountain equal in results with our now prosperous, wide-spread and farfamed Ruby Hill. The proprietor of the mine, Harry Strout, by giving his personal supervision to the working of the mine and furnace bearing the same name, has developed a property that better recommends itself by revenue returns than any written report could possibly give.

The Dunderberg mine deserves a passing notice. It was located among the first of the mines of the district, but until the ownership changed hands remained in obscurity. The developments are of an encouraging and substantial character. Powerful hoisting works have been placed over the mine and the company are now in a fair way to be reimbursed for their heavy outlay. The management of the property is in the hands of Captain John E. Plater.

Work on the Excelsior mine is being prosecuted by Joseph Ringot, manager. The yield of ore is encouraging.

John Driesbach is still driving the tunnel on the Fourth of July. From the survey the ledge will be reached in about twenty feet, when, all hope the owners will be amply repaid for their outlay.

O. Ball, of the Essex mine continues to extract ore of a paying grade.

Superintendent A. P. Copp, of the New York mine, loses none of his confidence in Adams' Hill, but regularly answers to a revenue tax.

The West Point mine, owned by E. H. Rose, promises a fortune to the owner, good ore being easily extracted. The location, geologically speaking, warrants a good mine.

Thomas Gilmer, owner of the Lady Dublin mine, Secret Cañon district, is working a number of men to great advantage.

The Williams mine, situated on Prospect mountain, Ben. Taylor, manager, has been worked for a number of years by the owners—men without capital—who, by persistent enterprise and individual industry, have succeeded in developing a property that will amply compensate them for their laborious efforts.

Among the most noticeable enterprises in the county, since my last report can be classed

The Ruby Hill Water-Works.

The proposition to conduct water by pipes to Ruby Hill was first conceived by Messrs. Clark & Seaton. Under the management of the present proprietor, Walter B. Harrah, the experiment has developed into a success. The amount of money necessarily expended in perfecting the arrangements whereby the town might be afforded a never failing supply of pure water has been considerable, and had it not been for the energy displayed by Mr. Harrub the residents of Ruby Hill would still suffer from an insdequate supply of water. The amount of water now controlled exceeds the demand, and if necessary could be doubled. The water for the use of the town is contained in six large tanks, with a united capacity of 152,000 gallons, which are always kept full. In addition to this the K K and Eureka Consolidated company's tanks are supplied with 16,000 gallons, and the Richmond company 20,000 gallons of water, aggregating in full 204,000 gallons constantly on hand, enough to furnish both Ruby Hill and Eureka with a full supply of water. Mr. Harrub has in addition to the springs at the head of New York cañon, the Way springs, in Secret cañon, which are connected by pipes with the main reservoir, and which alone afford sufficient water to supply a demand much in excess of present consumption.

Timber of any great amount is not found within 20 miles of Eureka. The devastation caused by the coal-burner give the hills near town a barren appearance. The cost of delivering coal to our furnaces is so great that already coke is being laid down from Pittsburg, Pennsylvania, where large orders are being filled for this market. When the supply can be procured from the

Pancake Coal Mines,

Tested to be equally as good as coke, then we can expect double the mining in our district, besides the opening of mines carrying low grade ores, now awaiting the inauguration of some cheaper mode of reduction.

Timbers for mining purposes are equally distant, and prices range correspondingly high.

MECHANICAL PROGRESS.

The Chemistry of Building Stone.

As in the construction of furnaces for their various nses, the metallnrgist and ths glass makera consider ths rsfractory power of the material to be subjected to intenae hsats, so tha architect of thie psriod of groat conflagrations should consider, among the other requisitea uf building atone, its behavior when snbjected to fire; it is not well enough to know that the chemical charactsr of a rock is an index to its fusibility. The manufactnrsr of fire-brick carefully selects qnartz as pnre as may be, and fire-clay as free from lime and iron as possibls, knowing, witbnut bsing able to give a reason, in moat cases, that theso slements vitiats ths product. They unite chemically to prodnce fnaible compounds, with as mucb certainty as potash or soda nnits with greass to produce soap, wbich is widely differsnt from either of these snbstances. Ths fate of limestones in our great firss is well remembsred, and ws havs but to consider ths composition to readily explain tbeir crumbling tendency at that tims. They consist mainly of carbonats of lims and magnssia; whon much magnssia is present they ars known as "dolomites"—it is of this that tho large cathedrul in Nsw York is bsing constructsd. It is as whits as any marble, and mads np of shining tabular crystals; when this or ordinary limestono is highly heated, its carbonic acid, amonnting to about forty-four per cent. of ths mass, is axpslled; thus, ordinary quick lims is prodncsd, and ths operation of a common lime kiln is repeated. As ths carbonate of magnssia is decomposed at a much lowsr temperature (600 deg. F.) than the carbonats of lime, stones containing it are less refractory than thoss of pure lime—it is present in all our Illinois limestone. Sandstone is cstainly among our best building material; it containa about ninety per cent. of silica or qnartz, among the most infusibls of substances, and small qnsntitiss of iron and alumina which gives it coherence. The orperience in Chicago with the Cleveland variety sesms to confirm this; one bouse in psrticular on the sonth sids, was mentioned by Mr. Wright, of ths American Institnte of Architecture, as a striking examplo.

Granite, like all primary rocks, is almost indestructible to ordinary atmospheric influonces, and yet sxplosions of blocks of it wers common in ths Boston firs; this may bs rsferrsd to inclosed water and the generation of steam, for, when freshly qnarried, a cubic yard contains abont thres and a half gallons of water, which, it is safe to assnme, is nsvsr all evaporatsd at tha ordinary tempsrature. Brick, a product of firs itself, absorb and rstain much moisture, which, when evaporated, prodnces a certain amount of porosity, and increases the tendency to vitrification in grsat fires; yet, like artificialstone, all ths water they contain after bsing baked, is chemicelly and not mechanically combined, and like ths latter material has cstainly a good record, and its value could no doubt be improved for structures by applying a coat of paint to exclnds water.

MACHINE WANTED.—A correspondent of ths Nsw York *Tribune* says: Farmers generally rsquire a machine, I think, snch as I have nsver seen or heard of, but of which I have especislly fslt the nesd, as it will save labor and utilize forage. It is this: Say a machine that will pulverize, or crush, ur grind, with unce handling, our corn crop; that will reduce ths entirs growth, cob, shuck and stalk, as fine as ordinary meal. After the corn is cut and put in stooks (twelve hills sqnare is the habit gensrally prevailing in the west); then as soon as the stooks are dry enongh, feed them entire into the machine, which might be similar to a grain thresher, and propsllsd by steam or horse power. My object is to place the corn stalks, as well as ths corn, in condition for the cattle to properly masticate, digest and assimilate.

NEW RIG FOR THREE-MASTED SCHOONERS.—Captain Robert B. Forbss, of Boston, has rscsntly invented a new rig for three-masted schooners, which it is claimsd, can also be nssd for propellers rsquiring considsrable sail, but which ia particnlarly designed for the first-namsd class of vessels. With respect to the economy of ths rig, Captain Forbes estimates a saving of several hundred dollars in the size of the masts, the absnnce of large hoops and blocks, heevy gaffe, and in the canvas, inasmuch as only the two lower stay saile and the jib nsed be of the heaviest. The booms being unincumbered by the sails when furled, can be nssd as cargo derricks. The eails all furling to the masts are more out of the way in port; more easily drisd and kept clean and mors durable.

REMOVING TREES BY STEAM.—A method of removing treea by dragging them out by the roote by a steam-engine, has been eqcccesfully introduced on the Duke of Sutherland's estate in Scotland. The engine, (a 4twelve-horse power, being one gsnerally need for plowing,) was placed in a field about 150 yarde distant from the trees; a chain was passed round each at eome distance from the ground, and the engine being then eet on, the tree was tumbled over and dragged out with a lerge ball of earth adhering to the roots. In this way 300 tress, of from six to 12 inches diamstsr were removed in a few houre; but trees of three feet diameter have bsen dragged out by the same means.

Improving Brittle Iron.

No doubt many observing persons must havo noticed in soms railways long in nse, that the iron scales and is shivered liks a wood track or rail. These scales fritter away ths strength and aubstance uf the rail, and render tbs movement of the cars irregular and subject to accidents, eomstimes endangering lifa and limb. We ars reminded of this by ths lats frightful accident on ons of our railways. Bnt a short time since an iron trausom or support in a building in Lonisville, Kentucky, broks and the bnilding gave way, endaugering tho lives of several persons engaged on the building. Though this was of cast iron, still ths same admonitiun follows to havo our works and railways of tougher and more durable matorial.

In the Bessemer process many impurities whicb, with an sxcess of carbon, ars the causes of the brittleness of muny kinds of cast-iron, ars burned out by means of the air-blsst pssssing foroibly through ths melted iron. Qaery: Can not cast-iron in general be greatly improvsd when, while in the mslted condition, air is blown through it? Without going to the extent of decarbonization and purification, as is done in the Bessemsr process, it is certain that evsry canldron with melted iron, before being poured into the moulds, may easily bs submitted tu a certain limitsd amount of air-blast, snd this by simpler means than are used in the Bessemsr works, requiring a highly expensivs plant.

Snch a proceeding would bs sspscially nssful in ths production of a snpsrior mallsable oast-iron in such localities as Indisna and Missouri, whsre the necssary materials, coal and iron ore, are in such excsptional states of purity.—*Am. Manufacturer.*

NEW APPLICATION OF ELECTRICITY ON RAILROADS.—The Frenoh have lately introduced a system by which a stationary electric battery is made subsarvisnt to blow ths whistle of an approaobing locomotive, in case the road is not clsar, without the engineer having to give any attention to it. Such an srrangement is, of courss, sxcesdingly valuabls at night, and espeoially during a fog, when signals can not be seen at a distance. It is the reverse of the system introduced on our Hudson river railroad, by which 'svery approaching locomotive sets a stationary slectro-magnetic alarm bell at the depot in motion. In ths French system referred to, the obstruction at the depot starts ths stsam whistle on every approaching locomotive when ths train is still far enough away to slacken speed and stop. It has now been in successful operation for a ysar on the line of the Northsrn company of France, informing the engineer whether the way is clear or not. The signel tendsr turns a disk and ssnds an electric current in the direction of the coming train to a bar placed between ths rails; when the engins rsaches the spot, a metel brush, placed betwesn ths wheels, sweeps the bar; the current passes to ths engins, and, by means of an electro-magnet, presses upon a lever which opens the steam whistls, thus making it blow automstically.

MEASURING THE STARS.—A method of determining the apparent diameter of ths stars, devissd by M. Stephan of Marseillss, appears to bs very ingenious, to say the lesst. If, through an excellent telescope, a star, whose angular diameter is really nothing, be viewed with a sufficient high magnifying power, the image is seen to be a bright spot surronnded by the concentric rings of light and shade which ere called diffraction rings. Now, it has been shown by M. Fizeau that these rings, if, of extreme faintnsss and distance from the central spot, can only bs formsd when the angular diameter of the source of light is nsarly insensible; and, following out this very unique suggsstion, M. Fizeau has applied to the Msrseilles telescope a diaphragm having two apertures for the observation of the fringes produced by the intsrference. If the star has a certsin diameter, the fringss will disappear altogether; and if its diameter is zsro, the distance of the fringes will vary with the distsnces of the two apertures in the diaphragm. Among the results of M. Stephan's investigation in this direction, is the interesting fact that Sirius appears to have a measureable diamster.

IMPROVEMENTS IN PUDDLING.—M. Masien, Louvroil, near Maubeuge, Nord, France, hss patented in Francs and Bslgium a new furnace. The form is nearly conicel, the air bsing freely admitted through apsrtures made sll along the fsce of the furnace at the hight of the bars. The heat is made to concentrate itself in the sole of the frnace, accslerating the puddling. The puddler is exposed to much lsss heat than in the caee of the square frnaces; and it is seid to be able to make from eight to nine charges of good raw iron, No, 2, in 12 hours, with a consumption of 1,400 to 1,500 kilogs., an economy set down at 300 to 400 kilogs., of ooal per ton of raw iron. The following are given as results of experience: With the Mesian furnace, a ton of good No. 2 raw meterial was produced with 1,050 kilogs. of coal, the ordinary furnace requiring 1,300 kilogs. A ton of extra strong iron was produced in the new furnace with 1,252 kilogs. of coal, ths old furnaces consuming 1,502 kiloge.

TELLURIUM.—The salte of tsllurium have the propsrty of imparting to the perspiratiou a most offensive odor. It is eaid that Professor Bunsen, who expsrimented on his own person, was compelled to absent himeelf from eociety for four weeks on this account; it is supposed that tellurinm will never be nssd extensively as a medicine.

MECHANICAL VIBRATION RETARDING RUST.—At the recent meeting of tha American Assoiation for ths advancsment of Science, Prof. S. S. Haldeman, of Harrisburg, read a paper with the abovo title, of which the following is a brief nbstract: When railroad bars ars piled beside a read they soon become rusted, while thoss forming the track are but little subject to oxidation; and whon a rsin of some hours' duration falls upon rails when in a state of rest, as upon Sundays, when trains do not run, thsy soon exhibit rnst. This would seem to indicate that in chemical combination mechanical vibrations may interfsre witb the molecular arrangement of tbe elements. The accuracy of thess ensual observation sbould, however, be subjected to the test of sxperimsnt. In tbe discussion which followed this brisf communication it was suggested tbst possibly the oil smployed upon locomotives might bs more or less spread in a thin film over rails in use, and thus prevent their oxidation. This view was earnestly combatted by other speakers. Prof. Van der Weyds was quite certain that the suggestion of Prof. Haldeman bore reference to a fact in physics. Molecnlar vibrations tended to prevent rust. A saw hung np, unused, would soon becoms rusty; if nsed, would keep bright. This was a gensral experisnce with tools.

A NEW and intensely white light has lately been invented and exhibited by Mr. Wm. Dsy, of Ohio. A thin ribbon of carbon is snspended betwesn two platinum poles, and covered by a globe contaiuing dry carbonic acid gas. The ribbon receives an electric cnrrsnt from a battery, and while in the atmosphsre of the gas becomes brilliantly incandescent. Ths carbon is not consumed, and the light is said to be perfectly constant. Ths msthod was invented by Professor Osborn, of Miami University, who at first thought it necessary to use very thin strips of carbon, but the light is now produced with much larger ribbons and with little combustion. The heat generated has nsver, as yet, broksn the small glass globs containing the ribbon. This light being constant, and not requiring the combustion of carbon, may provs much mors useful to scientific lectnrers than ths ordinsry electric or oxyhydrogen lights, both of which are troublesome to handle.

MECHANICAL TREATMENT OF METAL. — It sometimes happens that by centering, etc., tbe interior diameter of a tirs becomes so much too large that it will not fit the wheel. This defect may be corrected, acoording to a German plan, by heating the tire red hot, and holding it in that condition half immersed in cold water until cold, then heating again red hot, and immersing the other half in ths sams way. In the first opsration, the unimmsrsed hot portion must coutract with ths portion rapidly cooled, with a corrssponding condensation of material, and consequent permanent diminution of diameter, and, in ths second operation, a similar effect is produced on the other half. This rssort is not confinsd to tires alone—an instance being recorded where a ring of Bessemer steel, to be used as a flange ring, had bsen entirely missbaped by an inexperienced workmau, and was drawn into shape by heating fifteen times, and cooling different portions.

SCIENTIFIC PROGRESS.

Prizes Offered by the Dutch Society of Science.

Ths Dutch Society of Science, which held its one hundred and twsnty-secoud general meeting at Harlem on the 16th of Mey, offered prizes for the following questions, all papers to be handed in by January 1st, 1876:

1. Exact researches on the solvent power of water, and of watsr charged with carbonic acid, upon gypsum, limsstone and dolomite, at different pressures and temperatures, and in case of the simultaneous presence of common salt, and of other salts extensively distributed in nature.

2. Similar rsssarches on ths solvent power of water, and water charged with carbonic acid upon silica, and the common naturel silicates, under the same circnmstances.

3. Nsw researches on the structure of ths kidneys of mammifarous animals.

It appears to result from recent researches that the psptonss of the different albuminoid matters are mixtures of subetences partially known and partially unknown. Required, a critical examination of these researches, supplemented by personal investigations on the same question.

5. Exact determination, in Weber's unities, of the resistance of a colnmn of mercury of a meter in hight, and of a squere millimeter in section.

6. Improved experimsntal determination of the relations hstween the two kinde of experimental unities, the slectro-magnetic and electro-statio.

7. Nsw experiments on the influencs of preesure upon chemical action.

SCIENTIFIC AND MECHANICAL PRIZES.—The Academy of Sciences of Berlin offers a prize of $200, payable in July, 1876, for the best easy recording experimente as to whether changes in the hardness and friability of steel are dus to chemical or physical causes, or to both.

Passenger Transit.

The American Society of Civil Engineers bas appointed a committee of fivs to investigate the necessary conditions of success, and to recommend plans for—*First:* Ths best means of rapid transit for passengers, and *Second:* Ths best and cheapest methods of delivering, storing and distributing goods and freight in and about the city of New York; with instructions to examine plans, and to receive such suggestions as parties interested in the matter may chooso to offer, and to report on or before the first day of December, 1874.

The committos and the Society solicit contributions and suggestions of valus on the above subjects. Dus credit will be given for all aid rendsred to ths committes. In referring to plans proposed to accomplish these objects, it is particularly desired to ascertain accurately—

1st. The ronte and location proposed, and tbs rssaons therefor.

2d. The character of structure proposed in various parts of the city.

3d A closs sstimate of ths cost in detail.

Ths committe consists of the following gentlemsn: O. Chanute, M. N. Forney, Issac C. Buckhout, Charles K. Graham and Francis Collingwood.

We heartily recommend the subject to such of onr readers as fsol an interest in these very important subjects. Communications should be addressed to G. Leverich, 63 William street, Nsw York.

In connection with this latter proposition, we would give the following as the result of the prizs offered some two years ago for improvement in the navigation of canals: The Baxter line bave now six steam caual boats running bstween New York city and Buffalo. They have a carrying capscity of about 200 tons each, and make the trip each way in about six days. Allowing for one day at each terminus, tbe round trip is msds in fourteen days or two trips a month. This is double tbe spsed of the horse boats, tbey averaging hnt ons trip a month. During the winter these boats will run on some of the southern canals. They are already playing a very important part in solving the problem of cheap transportatiou.

CONSTANTS OF NATURE.—Ths Smithsonian Institution has in view the publication of a sries of tables of "Constants of Nature," such as the atomic weight of bodies, specific gravity, expansion, elasticity, spccific and latsnt heat, conducting power, melting and boiling point, weight of different gases, liquids, and solids, crystalline form, strength of different materials index of refraction and dispersion, polarizing angle, velocity of sound, of projectiles, of winds, of electricity, of light, of flight of birds, spsed of animals, etc.

The value of such a work in aiding original investigation, as well as in the application of science to the useful arts, can scarcely be overestimated. To cerry out the idea fully, however, will require much labor and ths united efforts of different institutions, and individuals dsvoted to special lines of research.

Hence that Society, through its Secretary, Prof. Henry, has issued a circular soliciting ths co-operatiou in this work of scientific individuals and societies generally.

Since the different constants are to he carefully tabulated, evcn a single determination of any one constant for sny onc body may prove to be of great value by supplying some important omission in a series.

Every contributor will bs credited with his determinations, when published. No more important contribution to the sum of knowledge and to the advancement of science, both practical and theoretical, can well be imagined than ths determiuation of some of these constants.

CRYSTALLIZED BISMUTH.—It is well known thst bismuth, when pure, forms beautiful groups of very perfect crystals, which exhibit a splendid play of colors, and resemble somewhat a huge fortification. In order, says, Bœttger, to obtain perfect crystals, the impure bismuth of commerce should be fused for half an hour with the twentieth part of its weight of nitrate of potash in a small porcelain crucible over a simple gas-burner, the mass being stirred occssionally with a clay pips-stem. The slag must then be carefully rsmoved, and the metal ponrsd into a small wooden box which is perfsctly dry. It is left theu uutil the greater part of the mctal which touches ths sides of the box becomes solid—only the center of the mass rsmaining fluid. By carefully turning the box, the fluid portion can be ponred into an iron dish. By sawing through the mass wbich has cooled in the box, a group of silver-white crystals will be found, some of which will be perfect octehedra.

A RAILWAY LAMP WANTED.—The London Society of Arts offers its gold medal or $105 to the inventor of an improved lamp or means of illumination suitable for railway passengcr carriages that shall produce a good, clear, steady, durable and safe light. It must be simple in construction, and capable of being readily cleaned and repeired. In judging the merits, cost will be taken into consideration.

CAT TAIL PAPER.—To the list of waste products that are now are now becoming utilized is to be added the common "cat tail," a plant that abounds in many marshy districts to a very great extent. M. Dupont prepares the fibre by boiling the cut and dried leaves for several houre in an alkaline solution, and then pressing between rollers and washing. Thus prepared it is valued at from $7 to $8 per hnndred weight.

The Eureka Mine.

The annual report of William Wett, superintendent of the Eureka (Grass Valley) mine is not an encouraging one. He ststes that the futnre prospect of the mine is one of great douht, although the dead work and exploration have heen immense, they have made no favorahle developments up to the present time. He says: The twelfth level cross cnt not heing in far enongh to strike the ledge, we have reason to hope that we may find pey ore yet. I am prospecting a front ledge, and have a shaft sunk on it 107 feet deep. The ledge is small and shows gold, but I am afraid the cross ledge will cut it off and disorder it, as it has done to the Eureka on the west. I have stopped work on the Mohile, Roannaise and Great Western, the indication in my opinion not warranting the company expending any more money. The mill, hoisting and pumping machinery are in fair working order.

In the Eureka mine proper during the year ending Sept. 30th 1874, they have driven 735 feet of drifts, 42 feet of rise, 191 feet of crosscuts, and sunk 207 feet of shaft; also, sunk 53 feet of No. 3 shaft on the Roannaise, and 107 feet on Eureka Ledge No. 2. They have hoisted 8,207½ tons of quartz, and crushed 8.130 tons in 303¼ running days as follows: 87¾ days with 15 stamps, and 216 days with 10 stamps, averaging a little over 2¼ tons per day to each stamp.

They concentrated 73¼ tons of sulphurets and worked 89 tons, and have now on hand 16¾ tons, which is valued at $700 net.

There are 325 tons of quartz on the snrface, and 350 hroke in the mine ready for hoisting There are upwards of 1,000 tons of ore in sight which will pay a profit.

The Secretary's report reads as follows:

RECEIPTS.

By book accts, Oct. 1, 1873	$113,656.25
By bullion acct	205,050.60
By mins acct	21.00
By mill acct	723.50
By wood ranch	1,751.03
By wood acct	14,282.84
By premiums	679.82
By McDougal works	729 36
By intsrest	4,884.66
	$341,779,06

DISBURSEMENTS.

To dividends	$80,000.00
To mine acct	83,254.93
To mins acct, prospecting	14,939.25
To mill acct	22,451.22
To sulphuret concentrat'n	1,495.00
To sulpburet reduction	480.00
To construction	16,539.00
To Great Western mins	4,600.06
To Roannaiss mine	1,115.00
To Eureka No. 2 mine	1,203.50
To wood acct	8,304.27
To wood ranch	889.78
To McDougal works	925.00
To bnilion xpenses	804.78
To gensral expenses	6,712.48
To discount acct	21.03
To book accts, Sept. 30, 1874	98,140.96
	$341,799,06

The heaviest items in the mine accounts are $7,823 for wood, $70,765 for lahor, $7,706 for lahor hy contract, and $6,000 for snperintendent's selary. The assets and liahilities are as follows:

ASSETS—AVAILABLE.

On hand September 30, 1874.	
Cash balancs	$08,140.96
16¾ tons of sulphurets, sstimated valus	700.00
350 tons of ore, broke in mine, cost $9	9,150.00
325 tons of ore, on surfacs, cost $10	3,250.00
134¾ cords of wood	606.37
Supplies at mill	1,000.00
Supplies at mins	1,200.00
	$108.046.73

REAL ESTATE.

Mill, estimated value	$30,000.00
Mine improvemsnts and buildings, estimated.	20,000.00
McDongal works, estimated	2,000.00
Wood ranch, 160 acres	800.00
	$52,800.00
	$160,846.79
Liabilities	None

Dnring the year ending Sept. 3d they mined 8,307¼ tons of ore and milled 8,130 tons. They also concentrated 103¼ tons of sulphurets, of which they worked 12 tons and sold 77 tons. It cost to concentrete these sulphurets, an average of $20 32 per ton. Worked hy chlorination these 12 tons yielded $1,884 42, and the 77 tons sold for $6,326 50.

The ore statement shows that they worked 8,130 tons of ore by mill process which yielded $196,839 62. Inclnding the sulphnrets, ore on hand, etc., the total yield was $202,979 96 or an average yield of $24 97 cents per ton. The averse yield of sulphurets was $101 37 per ton. The average fineness of the hullion was 794—equal to $16 41 33-100 per ounce.

The cost of mining 8,307¼ tons was $83,-533 33, or an avernge of $10 06 per ton. The cost of milling 8,130 tons was $21,237 72, or an average of $2 61 per ton.

The net profits of the mine for the year were $72,748 23. The eum of $80,000 was peid out in dividends.

The compeny commenced operations Oct. 1st, 1865. The receipts from that time up to Sept. 25th, 1874, were $4,308,538 87, of which $4,273,148 49 was from hullion. They have paid out for sundry bills, $301,906 50; for constrnction, $158,383 71; for dividends $2,054,-000; to mining, milling and other expensee, $1,692,601 93; having on hand in surplus and cash, $101,646 73. The net profits since Oct. 1st, 1865, amount to the very respectable sum of $2,615,936 84. The total dividends paid amonnted to $2,514,000, or $102 70 per share, so if the mine never pays another cent it has contrihuted more then the majority of qnartz minee do.

MINING SHAREHOLDERS' DIRECTORY.

Compiled every Thursday from Advertisements in the Mining and Scientific Press and other S. F. Journals.]

Mining Stocks.

Mining stocks this week have not heen very strong and the hear movement has predominated. Prices heve fluctnated considerahly, hut no break has as yet occurred. Affairs on the Comstock are particularly lively from one end to the other. The *Enterprise* says: "At the north end of the lode the outlook is particularly cheering. [Here we have the Consolidated Virginie, which is already yielding immense quantities of ore of astonishing richness, and in the lower levels of which developments are heing mede from week to week which prove that the real value of the mine is only heginning to he made apparent. North of this we have the new and very valuable developments in the Ophir, on the 1,300 and 1,465-foot levels of which mine hreasts have heen opened from which sufficient ore is already being extracted to run two mills, not to speak of the soon to he explored 1,700-foot level, on which will nndouhtedly he found the same ore hodies that are now heing worked on the levels ahove; hetween the Ophir and Consolidated Virginia lies the California, soon to he opened, and which is douhtless one solid chunk of ore equsl in richness to thet in either of the mines hy which it is honnded; north of the Ophir we have the Union Consolidated, in which promising streaks of ore are already heing encountered, and north of this again comes in the Sierra Nevada, in which of late a very important and nnlooked for development of ore has heen made in the old workings. To the southward we also have several develop mente of velue that are well known, and others that we exspect. Between the mines that are just now opening out new hodies of ore we have here and there other mines that are for the present in a had streak—out of luck. But let us remember for how long a time the Ophir was ont of lnck and for how long a time the Consolidated Virginia and the California gronnd was knocking about in the market (oftener out of it) ae worthless."

We give on this page the stock salee for today (Thursday), which will ehow the ruling prices.

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

California.

AMADOR COUNTY.

The Water In.—*Dispatch*, Oct. 17: The water has at last got through the great Amador canal, and was turned into the commodions distributing reservoir on the ridge between this piece and Sutter creek, last Wednesday. Miners who have taken np claims along the line of the canal can now commence preparing for work as soon as they feel so disposed, with a full assurance that they can hereafter he supplied with all the water they need both winter and summer.

ALPINE COUNTY.

The Rippon Mine.—Alpine *Chronicle*, Oct. 10: We are glad to learn that work on this valnable mining property will prohably he resnmed at an early day—after a rest of six years—hy ite San Francisco owners, who are now said to he psrfecting arrangements to thoronghly develop the mine. This claim ie on the dest side of Silver creek, and has a good reputation, prospecting well from the etart, and will nndouhtedly prove a valuable investment when properly opened.

CALAVERAS COUNTY.

Everlasting Mine.—*Citizen*, Oct. 10: We are informed that work will he commenced on the Everlasting mine, the former superintendent, J. C. Dyas, helieving that it can he made to pay.

Sheep Ranch Mine.—Work at this mine progresses as nsual, the rock paying an averge of $50 per ton. One hnndred tons of this sort of rock are now on the dnmp.

Murphys.—This camp does not present near as desolate an aspect as we supposed it wonld—the vacant lots not heing any worse looking than the empty houses which were hurned.

Gravel Mining.—*Chronicle*, Oct. 17: Gravel mining, notwithstanding the temporary scarcity of water, is progressing favorahly. The hydranlic claims are especially lively. Duryea, Veith & Co., Cook & Co., and others are pushing things vigoronsly.

West Point Distaict.—The old Butte dam on the North Fork of the Mokelnmne river, which formerly constitnted the head of the now Amador canal, is heing turned "upside down" hy I. H. Reed, Esq. The mine is worked systematically, and is well worth visiting. The ore in the lower sonth level of the Zacatero, shows plenty of free gold. Mina Rica follows suit in the 100-ft. sonth level. The Champion (Haskins & Co.) is now yielding very rich epecimens snitable for handsome jewelry. Henry & Son, owners of the Valentine, are extracting fine milling ore through a shaft. A portion of the mine is opened hy a tunnel hnt the owners are not ahle at present to extend it. A tunnel is heing started at the Good Faith. The tunnel, 300 feet in length, will tap the main shaft of the mine at the depth of 100 ft.

COLUSA COUNTY.

Quicksilver.—Colusa *Sun*, Oct. 17: The furnace on the Ahhott has been completed, and they have heen rnnning for ahout a week on first class ore. The company will have a clean up abont Monday. By some mistake their tanks did not reaoh them and they have had to plng the condensers np. The furnace of the Buckeye is fast approaching completion. The Elgin, with two little retorts, ie running out qnicksilver very fast—taking out ahont a flask a day. They have very rich ore in sight. Amos Roherts, is snperintending the castings for a furnace for the Wild Goose, and will heve it in rnnning order in a month or so. This furnace will he on the plan of thet at the Vallejo mine, which is said hy some to he an improvement on any other. It is a great deel cheaper. By next spring there will he a very large quantity of qnicksilver shipped from this point.

INYO COUNTY.

Getting Ready for Work.—Inyo, *Independent*, Oct. 17: John Simpson is in Cerro Gordo getting ready for active work on his 3,000 foot tunnel, the Potosi and Alpha.

Sale of Mining Property.—*Independent*, Oct. 17: There were two deeds recorded in the Clerk's office here, this week, one from James Brady to John Simpson conveying five twelfths of the Potosi and Alpha tnnnel rights to Simpson for $30,000 cesh, the other from same, one sixth of same property, to Thos. Hardy of San Francisco.

LAKE.

Quicksilver.—The Lake Co. *Bee*, of the 15th in an artio le on "quicksilver" titlee to mines etc. saye: In our own immediete neighhorhood, however, titles are hetter aesured and capitaliets invest freely. Only a few monthe ago Cross & Co. sold the Americen mine, (which had heen so hadly handled that it had acquired the expressive but nnenviehle neme of "The Dead Broke") for $150,000, and the purchasere would not sell to-day for three times the money. The American is a fine cinnahar mine, is on what experte deolere to he the grand helt. This runs eontheast and northwest and the hearinge of the Redington and Great Western leads are the eame. Lese than a mile down the canyon, in a northeaeterly direction from the American, are the Wall Street and Kearserge mines. Here free quicksilver is found. Work ie heing carried on energetically, and we notice that the proprietors

of the mine have just acquired 1500 feet in the Robert Lee claim, which adjoins their present property,

We understand too, that Mr. Wm. Stuart, of Knights Valley, has purchased a mine at Bradford's for $20,000. It is with the utmost satisfaction that we note investments of such a nature.

MARIN COUNTY.

Quicksilver.—Marin County *Journal*, Oct. 15: We learn that a party of gentlemen from some of the Sonoma mines have been prospecting some weeks in Point Reyes and along Tomales Bay for quicksilver, and think they have found valuable deposits on the lands of Mr. J. Miller, adjoining Tomales Bay. They have brought in a good quantity of what they consider rich specimens of cinnabar, and have made overtures to Mr. Miller for a fair interest in their discovery. They have taken the ore to San Francisco for assay, and as soon as its value is determined will take steps to work the mine. It is directly on the line of the railroad. If this proves as rich as it is believed to be, it will open a new industry and stimulate prospecting.

MARIPOSA.

Mining on the North Side.—*Gazette*, Oct. 15: Mining operations are being carried on extensively on the Coultorville side of the Merced—a new impetus having been given this branch of industry by the success attending the reopening of old abandoned shafts in the vicinity of Gentry's gulch. Besides the Hasloe and Banderita, there are other mines being opened up with flattering prospects. New hoisting works will shortly be erected at the old Martin & Walling mine—the machinery being now on the way. At the Teresa, situated a short distance below the Hasloe, they have a shaft down 160 feet, and are preparing the foundation for hoisting works. Prospecting is going on in all directions, and new discoveries may be expected all along the line.

The Mariposa Estate.—Bear Valley and Princeton are waiting in anxious expectation for the commencement of mining operations by the Mariposa land and mining company. There has been various rumors of what is about to be done, and whenever anything practical comes to the surface we will take pleasure in making a note of it. The grant has many valuable mines within its boundaries, and it will be a matter of general rejoicing in the county when the property is made available. It has lain idle now for several years, with the exception of a little dead work done under the direction of an old humbug "professor" at Bear Valley, which was worse than useless. The Princeton, Bear Valley, and Mariposa mines, are known to be productive, if well managed.

NAPA COUNTY.

The American Mine.—Napa *Reporter*, Oct. 17th: Workmen are employed on the road to this mine above the Kearsage. The American is now receiving the castings, etc., for the new furnaces now in course of erection.

The new town which is building up in the neighborhood of the Calistoga mine, and which has heretofore been known as Borlandville, has acquired a new name—Silverado.

Calistoga Silver Mine.—The mill is now completed and has been in operation about two weeks. The structure is a substantial frame of three stories, having ten stamps running, although it has steam capacity to drive twenty. Several tunnels have been run into the hill, and from these rock is being taken that assays from $30 to $1,000 to the ton, while the dirt dislodged in some of the tunnels assays $70. Below tunnel No. 2 some 200 feet, at which point a dump receives the rock that is shot thence down a chute into the wagons, another tunnel has been run in 50 ft. It will strike the ledge 400 ft. below where it is now being worked.

NEVADA COUNTY.

Magnta Mine.—The Magenta mine and works have been leased for a term of two years by a party of ten miners. The miners are to pay the Magenta company ten per cent. of the gross proceeds of the mine, for the use of the property. The lessees are Messrs. Best & Co., who are among the most experienced and energetic working men of the district.

Gold Run Mine.—*Transcript*, Oct. 15: Work has been continued on this mine uninterruptedly, and the incline is now down about 122 feet; the first 90 feet was through very soft running ground which required consummate skill to avoid accidents. The shaft is now being sunk in hard blasting ground. There are six inches of water, measured under a six-inch head, being pumped by two pumps, one nine inch, and one six inch. The ledge at the depth reached is six inches thick, shows some free gold, is fairly sulphuretted and contains some galena.

Dutch Flat.—Correspondent of Truckee *Republican*, Oct. 17: The Cedar creek company have been engaged the past year in running a deep bed-rock tunnel, for the purpose of washing the ancient gravel channel to its lowest depressions. It is now successfully washing through the first shaft, opening through it the Yankee claims, which, in days gone by, paid enormously for drifting. One clean up, the result of a partial run, has been made, which was very satisfactory, giving promise that this will prove here, as elsewhere, a very remunerative class of mining. The shaft above mentioned is perpendicular, 146 feet in depth. The gravel falling this distance and striking on boulders in the bottom becomes thoroughly pulverized, so that the gold is freed and easily saved. Washing in this claim (Yankee) will be continued until sometime in November. The outlook for the approaching season is very favorable.

The claims ready for washing are the Jehoshaphat and Central, owned by the Cedar creek company; the Somerset, belonging to Staples Bros., and North Star, No. 2, belonging to Voight & Lekamp. Besides which, the owners of the Boston are pressing work on a tunnel to tap the gravel on a lower level, intending to have it ready for washing early in the season.

PLACER COUNTY.

Gold Run Tunnel.—*Herald*, Oct. 17: Work on the Gold Run tunnel is being pushed ahead with more than flattering results. Early in the season it was thought they would be doing well to complete the tunnel by the first of January next. A few months since they set the first of December for completing the great undertaking, and now we learn that the tunnel is nearly through, a few weeks more only will be required to complete it. It will all be finished in good time for this winter's work.

We learn from visitors to Auburn, that at Dutch Flat, Gold Run, Michigan Bluff, Iowa Hill, and other sections, where large hydraulic mines exist, the miners are busily at work fixing their claims in order for the next season's run, which will commence soon after the first heavy rains, unless the weather should be so cold as to freeze the water in the ditches, or the snow so deep as to clog them up, as was the case last winter.

Lincoln Coal Mine Leased.—The *Union* tells us that R. C. Terry, L. L. Lewis and D. Coffin have leased from Colonel Wilson, for one year, with the privilege of extending the time, the Lincoln coal mine. They propose to go into the business of developing the mine in the most energetic manner, and will take steps to introduce the coal into general use throughout the State. Hoisting works of double the present capacity will be immediately constructed, and a good building to load from provided.

Iowa Hill.—The Morning Star mining company are making extensive improvements in their property. A prospecting tunnel has been run over a thousand feet into the bank and good prospects found. Arrangements are in process for working the company's mine by the hydraulic process. Five acres of ground have been cleared of the bush and timber, ready for washing. A tunnel two hundred feet in length, for sluicing, has been run, and they are now putting in boxes, which are five feet wide. The pipe is being manufactured on the ground by Hoskins of Gold Run. They will use 2,200 feet, three feet in diameter at the upper end, and tapering to eleven inches at the lower end. It will require about fifteen tons of iron to manufacture the pipe, the greater part of which is on the ground. One thousand inches of water will be used, the Iowa Hill canal company supplying it, and work will be commenced as soon as water can be had.

The canal company have completed a mile of flume at Tadpole, and water has been turned in.

The North Star company have been working their claim all summer, using two hundred and fifty inches of water. The mine has paid well, but the supply of water has been too small to work economically, and improvements are in progress by which a larger quantity will be secured.

PLUMAS COUNTY.

Items.—Jameson City cor. *Plumas National*, Oct. 14: The Plumas Eureka holds on in the even tenor of its way and is running up to its full capacity of forty stamps. They have ore enough now developed to last the mill for several years, have a goodly supply of fuel and timbers on hand, and are now engaged in hauling bricks and timbers for the new chlorination works which are to be erected in the spring.

In the Mohawk district Henry Neseman is building a new arrastra for working the rock from his discovery of last spring.

Willett & Co. have about completed their ditch and will soon be crushing by arrastrae from their series of ledges near the Sulphur Spring ranch. They have some good chimneys of ore, and will undoubtedly make a good showing.

At Hardscrabble all the mines upon the lower part of the belt are running constantly, having a good average success, occasionally finding nuggets of several ounces. Wilburn's claim, which is the highest of all upon the mountain, and almost above the water supply, did remarkably well for their short season, having run water through their hydraulic only 27 days, and cleaning up, as I am informed, $10,000.

On Jamieon creek the mining is about the same as for several years past, paying wages to those who work hard and steady.

At the head of the canon, about a mile and a half below town, are the claims of Tivnan & Barrett. These have been opened with a greater degree of system than any upon the creek. They have in a 30-inch flume of considerable length, lined with blocks and have an abundance of ground, with all Jamison creek as a water right.

SAN LUIS OBISPO COUNTY.

Furnace.—*Tribune*, Oct. 17: The "Oceanic" furnace will soon be in operation. When it opens fire we shall look for a sudden change in the quicksilver quotations. Its development shows a mine of truly wonderful wealth.

SONOMA COUNTY.

Mining Suit.—*R. R. Flag*, Oct. 15: The most important case likely to come up during the October Term of the District Court, to meet at Santa Rosa next Monday, will be the case of John White et al. versus Edgar Mills et al. As the titles to several valuable mines in Cinnabar mining district are involved, much interest will be felt. This case is a contest to determine the rights of claimants of 10 or 12 years ago, as against present occupants of mines located on the same ground. The complaint filed says, "The action is brought to recover possession of mining ground in Sonoma county known as the mining claims of the American Quicksilver mining company, embracing the claims located by the following companies, to wit: Pennsylvania, Healdsburg, Empire, Russian River, Gibralter, Chapparal, Petaluma, Buckeye, Boston, Alta California, San Francisco and Last Chance."

TRINITY COUNTY.

Nice Dust.—*Journal*, Oct. 17: Charley Kuper passed 250 ounces of very pretty gold dust over Griffin's counter last Monday. Junction City mines have paid exceedingly well this season.

I. Woonbury is cleaning out the old Seavy ditch, and rebuilding the flumes, preparatory to using it next winter.

Paid Well.—We learn that Adam Burger has done better in his claim, on Cañon creek, this season than ever before, and his was always a paying claim.

Work continues on the Bullychoop quartz ledge with favorable results.

TUOLUMNE COUNTY.

A Good Little Claim.—*Independent*, Oct. 17: A couple of arrastras will be put in working order on the "Ohio" quartz claim, in Calder's ranch, above Soulsbyville, as soon as arrangements can be made. A shaft has been sunk on the vein, which is three feet wide, 100 feet, showing excellent rock all the way. 30 tons on the dump, not a piece of which fails to give the color, although not a speck can be seen with the naked eye.

Hill & Wilson have bought the interest of Mr. Robt Marshall, being one-half of the Rising Sun mine, at Cherokee. There is a good prospect of striking a new chute on the property.

Nevada.

WASHOE DISTRICT.

Consolidated Virginia.—Daily yield 300 tons of ore. The ore breasts on both the 1,200 and 1,300-ft. levels are yielding finely. A winze 100 feet north of winze No. 2 has just been completed from the 1,200 down to the 1,300-ft. level, passing the entire distance through fine ore. The ore breasts on the 1,400-ft. level are yielding the usual amount of rich ores, and never looked richer or better than at present. A drift north is being carried forward ahead of the ore breaste on the 1,400-ft. level, the face of which is in splendid ore. This drift is being run by the use of Burleigh drills, driven by compressed air, which is a wonderful improvement over the old, slow, hand method of doing such work, as the compressors not only furnish the motive power for doing the hardest portion of the work, but ventilates the drifts to such an extent as to make the work comfortable in any portion of the mine. Two new engines for driving these drills have just been set up, making five in all now in operation in the mine. An up-raise has been started from the north drift on the 1,500-ft. level of the Gould & Curry, at a point 100 feet south of the winze which forms the connection with the 1,500-ft. level of the Consolidated Virginia shaft. The face of this raise is in magnificent ore, our samples averaging $230 and $250 per ton. A cross-cut has been run near the Best & Belcher line, which is also in rich ore. The north drift, on the 1,500-ft. level of the Gould Curry is also being driven ahead to the northward, the face in rich ore.

Sierra Nevada.—Sinking the new shaft is again progressing finely. The flow of water from the bottom is gradually decreasing. The connection was completed yesterday morning between the up-raise and the surface tunnel in the old Sacramento works. Cross-cutting the ore vein from the up-raise can now be commenced and there is hardly a doubt but that some fine ore developments will be made in that portion of the mine. The old ore breasts are looking finely. Daily yield 60 tons of ore, keeping the mill steadily running.

Ophir.—The ore breasts on the 1,300-ft. level continue not only their yield of rich ore, but are gradually improving in appearance as the opening on the ore bodies are extended. The east ore body on the 1,465-ft. level has been prospected for a distance of 30 feet, by the cross-cut, the face of which is still in rich ore. This body of ore it is estimated will mill $100 per ton. Its extent north, south and east is yet undetermined, but its richness and solidity is a guarantee that it is of no small dimensions. Daily yield, 100 tons of ore, which will probably be considerably increased in a very few days.

Leo.—In the north drift the ledge continues looking finely. In is from four to five feet wide, and carries good ore.

Crown Point.—The 1,600-ft. station is opened and a drift has been started to cut and prospect the ledge on that level. The main south drift, on the 1,500-ft. level is still driven vigorously ahead, the face in fine ore. Opening the ore stopes on the 1,500-ft. level for the purpose of extracting the ore, has just been commenced. The ore breaste on this level are all opening out finely, and promise a rich yield of good ore. The ore breasts on the 1,400-ft. level are yielding splendidly. The 1,300, 1,200 and 1,000-ft. levels contain thousands of tons of good ore which is being also extracted as needed, and which will last for many months to come.

Globe Cons.—Another fine and promising ore development has just been made in an entirely new and in fact almost unexpected quarter. About 300 feet from the 400-ft. station, while running the west drift, a small seam of quartz, only two or three inches was cut, which at the time did not appear of sufficient importance to attract special attention. A few days ago a drift was started northward on this seam, which in a distance of 25 feet has widened out to 14 feet, with well-defined walls, and much of the ledge good milling ore, and there is yet no determining the width and extent, or the importance either of this now strike.

Lady Bryan.—Main shaft 350 feet deep. Good progress is being made with the machinery, and it will be running in about 20 days from now.

Justice.—Work going on as usual, with no new developments to note.

Julia.—Draining the water is being prosecuted with all the energy possible. It is now down to with 3 feet of the 1,000-ft. level and will be out so as to admit of the resumption of work on that level in a very few days.

Woonville.—Since our last report, the ore body in the south drift on the 300-ft. level has increased both in extent and quantity, developing a heavy body of fine ore, the best yet found in the mine. The mill is doing good work, the shipment of bullion up to the 12th inst. amounting to about $5,000, which would have probably been increased about $500 more, had the batteries, which were copper-plated for catching gold, been cleaned up at the same time.

New York.—The north drift on the ore vein on the 560-ft. level is in 28 ft., the ore vein being 4¼ ft. thick and of a fine quality. The 700-ft. station is opened with a drift started for the ledge which is now in 23 ft. Some good developments may be looked for when this drift cuts the ore vein.

Rock Island.—Last Saturday evening the west drift, on the 200-ft. level of the new shaft, tapped a heavy body of water which has kept the pump running up to its utmost since.

Hale & Norcross.—The south drift on the 2,000-ft. level has reached the south line, without developing any paying body of ore.

Kossuth.—Cross-cutting the ore vein from the main south drift at the first station level is vigorously prosecuted without any important developments.

Nevada.—The lower tunnel is now in 200 ft, and has cut into the ledge itself 20 ft. without getting through it.

The north drift on the 1200-ft. level is still driven vigorously ahead, the face in good ore.

Yellow Jacket.—A cross-cut east from the air winze has been started to cut and prospect the ore vein on that level. A drift north has also been started to prospect the ledge and connect with the south drift from the Imperial.

Collar-Potosi.—The ore bodies in the upper portions of the mine are being gradually exhausted. Daily yield, 75 tons of ore, the assay value of which is $30 per ton.

Union Consolidated.—The east cross-cuts from the main north drift on the 1300-ft. level of the Ophir are still pushed vigorously ahead, finding in their course many small feeders and stringers of good ore.

Sutro Tunnel.—Eighty-four feet have been added to the length of the tunnel during the past week, making a total of 7,165 ft. from the mouth to the header. The ground at the face of the header is hard, but works well, and the Burleighs are doing excellent execution.

Sutro.—The flow of water continues quite strong, but does not interfere in the least with the progress of the work.

Savage.—Sinking the south winze below the 2000-ft. level is making good headway.

Florida.—The drift west at the 300-ft. level will have to run between 100 and 150 ft. to reach the ledge.

Occidental.—Sinking the winze from the old upper tunnel and raising up from the level below to meet it is making fine progress, the face of one and the bottom of the other in ore.

American Flat.—The cross-cut recently started on the 750-ft. level are still driven vigorously ahead, with very favorable indications of soon reaching the main ore vein.

Gould & Curry.—The water is sufficiently drained for the resumption of the prospecting operations on the 1,700-ft. level, which will be again pushed ahead with all the vigor possible.

Belcher.—Daily yield 500 tons of ore. The ore breasts are all looking well, and the usual amount of good ore is being extracted. The air shaft is being gradually extended downward and is fast drawing off the hot air of the lower levels and cooling the mine. The mills on the Carson river are again gradually increasing the amount of ore reduced and should the present cool weather continue a few days longer, will soon again be running up to their full working capacity.

California.—The north drift from the Virginia Consolidated on the 1,500-ft. level will make the connection with the south drift on the same level from the Ophir in about 12 days' time, when cross-cutting both the 1,400 and 1,500-ft. levels will be commenced simultaneously.

Imperial-Empire.—The Imperial south drift on the 1,850-ft. level is still driven vigorously ahead, the face in fine ore. Sinking both the north and south winzes on the 1,850-ft. level is making the usual good progress, the bottom of both still in ore.

Dayton.—The ore breasts on the first and

[Continued on Page 269.]

The Separation of Ores by Magnetic Power.

In most of our metalliferous mines, ores of several kinds are produced from the same lode, which it is the business of the dresser to separate. Where the specific gravities vary considerably, this is not attended with much difficulty; but where such ores as blende are associated with spathose iron, iron pyrites or copper pyrites—all ores of similar specific gravity—a perfect separation is impossible by hydraulic means, and such ores are frequently unsalable from the low percentage of metal, or from the injury caused by one metal in smelting the other. The latter is especially the case where iron and copper pyrites occur with blende, the smelter obtaining only hard spelter. The author had his attention directed to this subject by being interested in a mine where the ores from the vein-stuff consisted of lead, blende and spathose iron. The lead was dressed without much difficulty; but owing to the similar specific gravity of the blende and iron, these could not be separated, although the best-known methods of sizing and mechanical dressing were resorted to. This is not surprising, when it is known that the specific gravity of blende is about 4.0, and that of the spathic iron 3.85. The blende received from this mine being about three times as much as the lead, it became essential that the blende should be marketable. In carrying out various experiments upon these ores, it was found by the author that the iron, being composed of protoxide of iron and carbonic acid ($Fe O, CO_2$), would, at a dull-red heat part with its carbonic acid, and become then a magnetic oxide of iron. It is necessary, however, that this heating should be done without access of air, or a higher oxide, which is more magnetic, will be produced. The process is now in operation at the Ballycorkish mines, Islo of Man, and the agent reports that it is rendering vein-stuff that has hitherto been unmarketable, and commonly discharged with the halvans, of high commercial value.

The treatment adopted is as follows: The blende and iron ores are fed through a hopper into revolving iron retorts heated by a fire beneath, and are delivered when heated to redness in a close chamber. The ores thus prepared are carried by an elevator to the magnetic machine, which consists of four magnetic wheels, the magnets being so arranged that the whole surface of the wheel is magnetic. The ore falls upon a band which passes round the wheel. This band is made of any thin material that allows the magnetic force to pass through, and the blende not being held to the wheel, falls into a shute and is received into harrows, while the iron adheres to the wheel, and drops into another shute at a point where the hand is removed from contact with the wheel by means of a roller. In the separation of copper pyrites or iron pyrites from blende, the treatment is somewhat similar; but the heating process is more simple, as access of air during the heating is an advantage. The result of the application of heat on pyrites is to remove a portion of the sulphur, bringing it to the condition of magnetic pyrites, which occurs as a distinct ore in some mines, and its composition is represented by $Fe S^2 + 6 Fe S$, while that of iron pyrites, before heating, is $Fe S^2$. From the data already obtained it is found that although the arrangements for heating ore are not yet perfect, these ores can be heated at a cost of about 3s. to 4s. per ton, including fuel, attendance, etc.; and that blende ores, hitherto unsalable, can be brought to a value of £3 to £4 per ton. The author trusts that this result is of sufficient importance to justify his bringing the subject to the notice of the Miners' Association of Cornwall and Devon.—*F. C. King, in London Mining Journal.*

Wages in Europe and the United States.

So far, during the present year, the statistics show that the emigration to this country has fallen off nearly 40 per cent. as compared with previous years, and, indeed, a large number of emigrants have actually returned home, being unable to find employment. This being the case, and as reduction in the price of labor is now being discussed, the following tables, collected by the National Bureau of Statistics, and by the Massachusetts Labor Bureau, have an important bearing on the question. These figures were made for the year 1872, and are reduced to our currency.

If we take the ordinary farm laborer in Massachusetts, we find that his weekly wages are $5 with board—which is undoubtedly equivalent to $10. The highest wages in England, paid in Lincolnshire, are $8.17, without board; in Kent, $6,81; in Devonshire and Cornwall, $4.08; in Ireland, $4.91, without board; in France, the highest weekly wages are $2.96, with board; in Denmark, $1.43; in Italy, $3.89; in Prussia, $2.85—all with board.

If we now take the trades, the difference is even more remarkable. We find that a blacksmith in Massachusetts receives $18.50 per week; in England, $7.90; in Scotland, $7.62; in Germany, $6.75; in Prussia, $7.29; in France, $6.01. In the book-binding business the wages are equally remarkable in Massachusetts as compared with with England. A first-class finisher gets $26 in Massachusetts, and $10 89 in England; a forwarder earns $18 here, against $9.80 in the old country; a female folder is paid $9 in Massachusetts and $3.81 in England. Again, in the great trade of Massachusetts in boots and shoes, the first-class upper cutter will earn $18; while the European is paid $7.08; the female machine hand is paid $10, and $2,70 in Scotland: a mender of shoes earns $15 here, against $9.53 in England, $6.75 in Germany, $4.38 in Prussia, and $3.38 in Italy.

Our most expensive trades are the building trades, and in them we see the enormous difference of wages between the two continents. A first-class moulder of bricks earns $20.77, with board in Massachusetts, and $5.94 with board, in England. A mason is worth $24 here, against $10.17 in England; $9.53 in Scotland, $4.50 in Prussia, and $3.21 in Italy. A bricklayer is paid $24 here, against $10.17 in England, and $5.97 in Germany. A plasterer commands $24 in America, while his wages in Europe vary from $6.08 in Italy to $17.10 in Prussia. A carpenter earns $17 in Massachusetts, while in England he would earn $18.17, in Scotland $7.62, in Germany $9.25, and in Switzerland $8.10. Plumbers earn the comparatively low wages in Massachusetts of $10; in England they are paid $9.78, in Germany $4.86. In the business of slating houses, the wages here are $18, to about $8 in Europe. In painting they are $17 to about $10 in England, and about $12 in Germany.

Considering the unexampled good harvests both at home and abroad, and the consequent decrease in the price of food of all kinds, it would seem from the above figures that wages in this country are disproportionately high, and that the tendency will be to lower figures.

The Black Hills.

John W. Clark writes as follows to the Detroit *Tribune* from Cheyenne, Sept. 26th: I arrived here from Detroit last Wednesday *en route* to California, and concluded to remain over at this point for the purpose of learning all the latest news from the Black Hills region. Some 20 or more persons left this vicinity nearly a month ago with the understanding that they would join expeditions from Montana and other places. They succeeded in meeting only one party of 46 persons, which they joined, making the whole number 66. They represent that they have made a thorough inspection of the gold region of the whole country traversed by the Custer party, and without meeting with any success in the discovery of gold as reported by General Custer. In fact, not a color of gold was found in any of the streams by any member of the party.

Several lodes of silver-bearing quartz were found, but as to the real value of the same no one can tell until a proper test is made of the ores brought in.

The country is represented as having every appearance of long and severe winters, and (with the exception of the gold report by General Custer) is nearly the same as the report heretofore published in your paper.

The company made hurried marches, knowing that it would be unsafe to remain long in any place on account of the Indians, who are reported as being very dangerous and numerous.

I received my information from Mr. James Dubois, a long resident of California, and a thorough miner, who was one of the party returned, en route to Salt City, where he resides. I advise all persons having an idea of going to the new El Dorado to abandon the same at once. Surely there is anything but a bright outlook at this time.

THE PINE MOUNTAIN MINES.—Mr. John Broder returned a few days since from a visit to the Broder-Moffat mines at Pine mountain. He ordered work continued on the Last Chance the ledge generally referred to as the Moffat, mine. The developments in this and other mines of the district are deemed quite sufficient to justify the erection of a furnace, which we are assured will be done next spring, if not sooner; the lateness of the season being the only reason for a postponement. We are told by experts in whom we have confidence that the ores of Pine mountain, like those of Sylvania, are of the very best smelting class, there being positively nothing contained in any of them to clog or "freeze" a furnace. The average value of the galena ores proper, of which there is an abundance, as determined by numerous assays, is $73.70 silver per ton. Besides this class there is an immense amount of carbonized lead ore, treated as refuse, some of which Mr. Broder brought in, and had assayed by John A. Knapp, manager of the Swansea works. Lot 1 gave 54 per cent. lead, and 29.16 ounces silver per ton, worth $37.42. Lots 2 and 3 gave a slight percentage less in lead, but silver value the same, being an average of $34.80 in silver per ton. The choice ores run as high as $270, and all considered Pine mountain is certain to be one of our most valuable furnace districts, and one too, so situated as to be of great advantage to the interests of the central or agricultural portion of this valley, relatively of more value in this respect than Cerro Gordo and Panamint both together, since the bulk of everything of the kind from these two, owing to their geographical positions, is lost to us entirely.—*Inyo Independent, October 3d.*

AMONG the list of Vice-Presidents elected by the American Social Science Association, appears the name of President Gilman of the University of California and Professor George Davidson, of the United States Coast Survey, President of the California Academy of Science. Professor Davidson is now absent from this city in charge of one of the expeditions for observing the transit of Venus. His station is in Japan.

The Microscopical Society.

The regular semi-monthly meeting of the San Francisco Microscopical Society was held on Thursday of last week, President H. G. Hanks in the chair: Mr. W. H. Pratt was elected a corresponding member.

Under the head of donations, Mr. Hanks presented a slide mounted with a fragment of brick, from the arch or roof of a furnace in which gold sulphurets were roasted, in Calaveras county. The surface was covered with gold, which, under the microscope, presents interesting peculiarities.

Mr. Kinne presented several slides, mounted by him, embracing the following objects: Pollen of Periwinkle, exhibiting their peculiar slit-like markings; foraminated encrustations on berries of Fuca Navalis, found in the Gulf Stream; hairs of caterpillar, the larva of Spilosoma Acrea, showing minute spines arranged on the main shaft in somewhat regular whorls; sections of cypress, both transverse and longitudinal, showing the characteristic dotted ducts.

Mr. Edwards presented fragments of insects for mounting, from Japan. Dr. Blake presented a species of Coccus, found in the leaves of the growing Fuschia.

Dr. Cooper presented a variety of fungoid growth, found on willows, which was referred to Dr. Harkness for further examination.

Dr. Harkness exhibited the Achyla Prolifera, a fungoid growth found on the bodies of dead flies, and gave a very interesting account of its method of growth. Some very fine specimens of Closterium were shown, which are found abundantly in the bottom of pools, on any sunny day, at the present time, and which illustrated very beautifully cell rotation. Another form of vegetable life, the Gonium Pectorale, revolving across the field with a life-like motion, taken in connection with the Euglena, classed as a genus of Infusoria, and found in the same drop of water, served, with several other forms of life referred to by Dr. Bastian in his experiments on the "Beginning of Life," as a theme for a very interesting evening's study.

REMOVAL OF TRUSTEES.—The County Court has been petioned by a majority of the stockholders of the Justice mining company to call a meeting of the stockholders for the purpose of taking into consideration the removal of the Trustees of the company from office. The petition is signed by Woods & Freehorn, representing 3,490 shares; E. Hesties, 1,880 shares; Dudley C. Bates, as Trustee, 100 shares; Schmeidell, Hochstadter & Co., 270 shares; James H. Lathsm & Co., 3,603 shares; E. Von Santen, 800 shares; T. H. Hawkins, 200 shares, C. A. Kennedy, as Trustee, 200 shares; W. J. Smith, 700 shares; making a total of 13,173 shares out of 21,000 shares of the corporation. The Board of Directors consists of Emilie Hesties, John T. Hill, A. P. Minear, John P. Jackson and J. Clem Uhler. The petitioners say they deem it the best interest and advantage of the company that the management and control of its affairs shall be changed by the election of other Trustees. It is proposed by the petitioners to remove all the Trustees, but especially Minear, Jackson and Uhler.

COLUMBIA DISTRICT.—The news from this new mining camp is very encouraging. We learn from our old friend George Keating, who is largely interested in the district, that work is being prosecuted vigorously on the Badger and other claims in the district. Mr. Keating, who was a delegate to the convention, brought several lots of ore to town from the principal mines, samples of which were worked at the Humboldt Reduction Works, with the following results: Badger, $100 per ton in gold; Panther, $300 per ton in silver, and 35 per cent. in copper; Mayflower, 70 per cent. copper. We are assured that ores like those mentioned are plenty on Bartlett Creek, and mine owners in that vicinity, are confident that if a railroad is built from Winnemucca to Oregon, so as to enable them to transport it, they can supply all creation with copper. As it is, several large teams will be loaded immediately by Keating & Co. with ore from those mines, for the reduction works of Gintz & Ginacca.—*Silver State.*

CHINESE CIVILIZATION.—We notice this week another indication of Chinese advance in civilization. A Chinese washman in St. Helena, Napa county, has advertised his wash house in the newspaper there, the St. Helena *Star*. He says washing and ironing neatly and nicely done, and puts "NO MISTAKES" in small caps. Not only has he advertised, contrary to the custom of his kind, but he has also prevailed on the editor to give him a "puff" in the local columns, in connection with his advertisement. The puff is as follows:

Mow Hing—"*Charley.*"—This enterprising Chinese wash-house-man has advertised, "melican fashion," to-day. He says, "me savey printer ink belly good. You tell em I makee no mistakes. I wash em well."

This circumstance go to show that the Mongolians in this State are fast advancing, and learning some of the "tricks that are dark" of the American citizens. Chinese advertisers are new things under the sun.

THE total number of mail letters collected by the carriers in this city, during the year 1873, was 2,460,427; and the postal cards collected numbered 158,485; while during the first three quarters of the present year 2,522,309 mail letters, and 271,957 postal cards were collected.

Powder Making in California.

The purely mechanical part of the manufacture of powder is essentially the same in principle and only differs in extent of details in the various mills. Our readers will probably like to understand something about how it is made, so we will tell them how they do it in our California mills, belonging to the California Powder Works, on the banks of the San Lorenzo creek, Santa Cruz county. The mills are described as follows: The motive power in most powder mills is water, although both steam and water is used at the California Powder Works. The supply of water used here is taken from the river about one mile above the works, by means of a flume and ditch; but to secure sufficient fall the company were obliged to cut a tunnel 1,160 feet in length through the mountain in the rear of the works.

On entering the different buildings—of which there are 15—located on a circular railway track, at a distance of from 30 to 175 feet apart, you are required to brush and dampen your boots, so as to remove all sand and dirt adhering to them. The different ingredients are conveyed from one building to the other upon small platform cars covered with canvas. The first you enter is the refining room for the nitre or saltpetre. Here you find two large copper tanks for dissolving, and four large vats for crystalizing. Adjoining this is the drying and grinding room. The next is the charcoal house, located about a quarter of a mile from the works, on the opposite side of the river. Here they char or roast the wood in cast iron cylinders, so arranged in mason work as to permit the flames from the furnace underneath to circle around them. There are 20 cylinders, with a capacity of 120 pounds of charcoal each. After being submitted to this roasting process for 9 hours, it is then conveyed in large iron tanks on platform cars to the cooling room, where it is allowed to remain 24 hours. Number four is the pulverizing room. Here you find 20 large wooden cylinders containing iron balls; they revolve at the velocity of ten revolutions per minute, and contain the sulphur and charcoal to be pulverized. The pulverization occupies about 24 hours time. Next in order are the wheel houses—five in number—there the danger of powder making commences. In a large iron basin, to be ground, is placed what is termed a charge consisting of about 200 pounds of the different ingredients which compose powder. The following are the proportions in which they are mixed: saltpetre, 75 per cent.; charcoal, 15 per cent.; sulphur 10 per cent.—in a moist state. The charge is allowed to remain from three to eight hours, subjected to the pressure of 15 tons, produced by a pair of iron wheels revolving on an upright shaft. As the grinding process draws to a close, the utmost care is necessary in watching the charge, so as to prevent it from becoming too dry, in which case an explosion is the inevitable result.

We now pass to the press house, where in a hydraulic press between two copper plates the pulverized powder is subjected to a pressure of 4,000 pounds to the square inch, after which it is known as press-cake, and apparently resembles slate, being half an inch in thickness. The powder has now to be granulated, which is done in the grain house, by passing the press cake between a pair of metal cylinders. As it passes from the cylinders or rollers, it is submitted successively to the action of sieves of gradated fineness, when the portions too coarse to pass through are subjected to a second and third set of rollers.

The granulated powder is next freed from dust by running it through reels, similar to the bolter employed in dressing flour. It is now ready for the drying house, where it is placed on canvas shelves, and dried by means of steam heat. The powder is now glazed, by subjecting it to rotary motion in barrels or drums, in the glazing house. The rotation must be just sufficient to cause the grains to roll over each other slowly. It thus becomes polished by attrition. It is then taken to the packing house where it is weighed, and placed in cans and kegs ready for shipment.

There is an extensive cooper shop connected with the works, where 640 wood and iron kegs are manufactured daily. The cottages occupied by the employes and their families, which number about one hundred, can be seen a short distance above the works, and resembles a country village in many respects. A more desirable spot could not have been chosen for the location of the company's works, which are very extensive, extending up and down the river for about two miles.

ANOTHER lot of 750,000 salmon from the Government fishery on the McCloud river, has been started for these destinations: R. G. Pike, Middletown, Connecticut, 150,000; James Duffy, Manetta, Pennsylvania, 150,000; Alex. Kent, Baltimore, Maryland, 150,000; James B. Thompson, New Hope, Bucks county, Pennsylvania, 150,000; Alfred A. Reed, Jr., Providence, Rhode Island, 100,000; Samuel Wilmot, Newcastle, Ontario county, Canada, 25,000; H. H. Thomas, Randolph, Cattaraugus county, New York, 25,000. At the fishery there is now being prosecuted the work of hatching 1,000,000 young Salmon for the Sacramento river. After being hatched they will be placed in the McCloud river near the fishery.

THE old Empire, on the Comstock, has again fallen into the ranks of ore producing mines,

Useful Information.

Mixing Putty.—We give below a number of valuable formulas for making putty for various purposes.

Common window putty.—Mix whiting and linseed soil to a stiff dough.

Carriage painters' putty.—Take dry white lead and mix with one part brown Japan and one part carriage rubbing varnish. A common wagon putty is made by using whiting in the place of dry white lead and adding a small quantity of white lead in oil, from the keg. This putty should be kept in water when not in use, to prevent drying.

Cementing putty, for water or gas pipes.—Take red lead and white lead, equal weight, and mix with boiled oil.

Putty for furniture.—Mix whiting, Indian red and lamphlack in equal proportions, with carriage varnish, adding a small piece of beeswax to the putty, by heating the same and pounding it well with a mallet, until thoroughly amalgamated.

Hardwood putty.—Take fine sawdust of the same kind of wood, and mix with strong glue.

Putty for walls.—Whiting mixed with glue, or calcined plaster (gypsum) and water.

How Imitation of Gold is Made.—Pure copper, 100 parts; zinc or preferrably tin, 17 parts; magnesia, 6 parts; sal ammoniac, 3.6 parts; quicklime, 1.8 parts; tartar of commerce, 9 parts. Copper is first melted, then the magnesia, sal ammoniac, lime and tartar are added, separately and by degrees, in the form of powder; the whole is now briskly stirred for about half an hour, so as to mix thoroughly; and the zinc is added in small grains, by throwing it on the surface and stirring until it is entirely fused; the crucible is then covered and and the fusion is maintained for about 35 minutes. The surface is then skimmed and the alloy is ready for casting. It has a fine grain, is malleable and takes a splendid polish. It does not corrode readily, and for many purposes is an excellent substitute for gold. When tarnished, its brilliancy can be restored by a little acidulated water.

Marbling.—A fine white marble imitation is made by painting the work with white lead paint, finishing it with China gloss. Then when dry and hard rub the surface until smooth, with fine pumice stone and water, wash clean, dry well, and then holding a lighted candle near the surface, allow the smoke to form the various shades, tints and veins desired. A black crayon may also be used to form fine irregular lines; then, with a very soft hair varnish brush apply a light coat of white Damar varnish, being very careful not to disturb the smoked figures.

Black or variegated marble is made by streaking the surface with colors mixed with carriage varnish and turpentine, using a feather to form the fine lines, and a sponge or crumpled paper smeared with color and then danbed on the work.

The sugar insect is never found in loaf or other refined sugars. All impurities are entirely removed in the process of refining, and nothing remains but pure saccharine matter, with sometimes a trace of salts. The sugar insect, *Acarus sacchari*, inhabits brown sugars, from 42,000 to 268,000 being found in a pound weight. If a spoonful of raw sugar be dissolved in a wine-glass of water, the insects will come to the surface, where they may be seen with a microscope swimming about vigorously. Many scientific men consider the sugar insect identical with the *Acarus scabei*, or common itch insect. Brown sugar is neither so economical nor so healthful as white, and could one but once look through it with a microscope, or see the refuse from the filters in a sugar refinery, he would never eat any other than refined sugar.

To Prevent Rusting.—Boiled linseed oil will keep polished tools from rusting if it is allowed to dry on them. Common sperm oil will prevent from rusting for a short period. A coat of copal is frequently applied to polished tools exposed to the weather. Woolen materials are the best for wrappers for metals. Iron and steel goods of all descriptions are kept free from rust by the following: Dissolve ½ oz. of camphor in 1lb. of hog's lard, take off the scum and mix as much black lead as will give the mixture an iron color. Iron and steel, and machinery of all kinds, rubbed over with this mixture and left with it on for twenty-four hours, and then rubbed with a linen cloth, will keep clean for months. If machinery is for exportation it should be kept thickly coated with this during the voyage.

Fastening Leather upon Metals.—The following is said to be a good recipe for fastening leather upon metals: Digest one part of nutgalls six hours with eight parts distilled water, and strain. Glue is macerated in its own weight of water for twenty-four hours, and then dissolved. The warm infusion of galls is spread upon the leather, the glue solution upon the toughened surface of the warm metal; the moist leather is pressed upon it and then dried, when it adheres so that it cannot be removed without tearing.

A new tubular petroleum lamp has been constructed by MM. Defienne. It consists of ten small circular wicks in place of one large one. They are arranged in a circle, and are attached to a frame movable by a single rack.

Removing Nitric Acid Stains.—The yellow spots produced by nitric acid may be removed from brown or black woolen goods, while fresh, according to Th. Wegler, by repeatedly dipping them into a concentrated solution of permanganate of potash, and then washing with water. The yellow spots on the hands may be removed in the same way, the brown stain produced by the permangate being removed by an aqueous solution of sulphurous acid. Old stains cannot be removed by this or any other process, nor will it answer for cloth or any other color but black or brown.

Fastest Steaming and Racing.—The fastest time on record for steamboats, it is said, is that of the "Mary Powell," which recently made the 28 miles from New York to Piermont, in one hour, which is at the rate of one mile in 2 minutes 8½ seconds, with a boiler pressure of 37 pounds. The fastest time on record for horse-racing, is that of the mare "Goldsmith Maid" at Mystic Park, Boston, which was 2 minutes 14 seconds per mile, corresponding with almost 27 miles per hour.

Utilizing Carbolic Acid.—The immersion of hides for hours in a two per cent. solution of carbolic acid, and then simply drying them, has been recently substituted for the tedious and expensive process of salting them for transportation from South America and Australia, and with most satisfactory results. Bones have been similarly treated for transportation.

Experimental Cremation.—A trial has been made at Breslau, before the National Science Congress, of Dr. Reclam's new cremation apparatus. In half an hour the soft parts of the body were thoroughly consumed, and within an hour the bones were reduced to white ashes.

Good Health.

Milk Diet in the Treatment of Disease of the Heart.—Dr. Pecholier, of Montpelier, attributes great importance to the milk diet, not only in dropsy, like some of his predecessors, but also in other diseases, and especially those of the heart. He states that in active hypertrophy—namely, in those cases where the consequences of the development of the muscular fibres prevail over the embarrassment of the circulation caused by the dilatation of the cavities, the contraction of the orifices, or the insufficiency of the valves, and where, in consequence, the tension of the blood is great in the arteries, and the radial pulse is full and hard; in such cases, at their commencement, the milk diet, together with the use of digitalis, and sometimes without it, will, if continued long enough, induce at once an amendment of the symptoms, and even at last, all absorption of the superabundant muscular tissue, and thus effect a cure. But in order to secure success, the patients must strictly observe the injunctions given to them; and hence the treatment is more successful in those cases where the lesion has produced great inconvenience and suffering than in those where the patients suffer little, because in the latter case they are unwilling to submit to the rules of diet. Under the influence of the milk diet, it is found that the impulses of the heart diminishes, together with the palpitations, and the congested condition of the face, the brain, and the lungs. The patient experiences an unexpected improvement, and by the adoption of this plan life may be prolonged and rendered more supportable; and even where a cure cannot be hoped for, a great palliation of the symptoms may be induced.—*Brit. and For. Med. Chir. Rev.*

The Benefits of Exercise.—Exercise is health-producing, because it works off and out of the system its waste, dead, and effete matters; these are all converted into a liquid form, called by some "humors," which have exit from the body through the pores of the skin, in the shape of perspiration, which all have, and which all know is the result of exercise, when the body is in a state of health. Thus it is that persons who do not perspire, who have a dry skin, are always either feverish or chilly, and are never well, and never can be as long as that condition exists. So exercise, by working out of the system its waste, decayed and useless matter, keeps the human machine "free"—otherwise it would soon clog up and the wheels of life would stop forever. Exercise improves the health, since every step a man takes tends to impart motion to the bowels; the proper amount of exercise keeps them acting once in every twenty-four hours. If they have not motion enough, there is constipation, which brings on very fatal disease; hence exercise—especially that of walking—wards off innumerable diseases, when it is kept up to an extent equal in inducing one action daily. Exercise is healthful, because the more we exercise the faster we breathe—we take that much more air into the lungs; and it is the air which we breathe which purifies the blood, and the more air we take in, the more perfectly is that process performed. The purer the blood is, the better the health must be. Hence, the more the consumptive stays in the house, the more certain and speedy is his death.

Bee Stings.—It is said that a few drops of coal oil applied to parts stung by bees, wasps or hornets, will give instant relief.

Hay Fever And its Cause.

In a book entitled "Experimental Researches on the Causes and Nature of Catarrus Æstivus (Hay fever or Hay asthma)," Mr. Blackley publishes some very interesting conclusions respecting this singular disease. He finds that it is peculiar to the educated classes, but is not aristocratic like the gout, being more common in proportion to the spread of mental culture and the intensity of intellectual occupation. And yet a highly organized state of the mind, is not the only element in its propagation, for race qualities seem to have a marked effect upon it. Thus in Europe it is most common in England, after which follow Germany, France, Belgium, Switzerland, Scotland, Italy, Russia, Ireland. Climate, therefore, has no influence upon its propagation, for England and Ireland, which are geographically contiguous, form the extremes of the above list. Out of 152 patients, 81 were English, 36 German, and only one Irish. As to the actual inciting cause of the disease, it has been referred to summer heat, dust, ozone, the odor of flowers, the pollen of blossoms, and especially of grasses. The author's experiments lead him to the conclusion that it is to the pollen of flowering plants (including grasses) that the disease is due. He collected pollen grains from the atmosphere, and gives curves showing the number of grains which gathered on a square centimetre of surface from May 28 to August 1, 1866, the highest number, 880, falling on June 28. By using kites he ascertained the proportionate amount of pollen at high levels in the atmosphere, with the somewhat remarkable result that at 1,500 feet above the earth the pollen was found to be more abundant than on the surface. The author found that germs and spores of other plants generally outnumbered the pollen, and he thinks that "if these should resemble the pollen in its capacity for absorbing water and discharging granular matter under the influence of moisture, we may have a form of finely divided vegetable and animal matter thrown into the air which the best modern instruments might fail to discover the nature and origin of, but which might, nevertheless, be a powerful cause of disease." As to the places least likely to be affected by the disease, the author found hay fever least common in those localities where pollen is least likely to be plentiful, such as the centers of large cities, the seashore, and high-lying districts giving up to pasturage.

Why Children Die.—The reason why children die is because they are not taken care of. From the day of their birth they are stuffed with food, choked with physic, suffocated with hot rooms, steamed with bed clothes. So much for indoors. When permitted to breathe a breath of air once a week in summer, and once or twice during the cold months, only the nose is permitted to peer into daylight. A little later they are sent out with no clothes at all, as to the parts of the body which need most protection. Bare legs, bare arms, bare necks, girted middles, with an inverted umbrella to collect the air and chill the other parts of the body. A stout, strong man goes out on a cold day with gloves and overcoat, woollen stockings, and thick double-soled boots. The same day a child of three years old, an infant in flesh and blood, and bone and constitution, goes out with soles as thin as paper, cotton socks, legs uncovered to the knees, neck bare; an exposure which would disable the nurse, kill the mother in a fortnight, and make the father an invalid for weeks. And why? To harden them to a mode of dress which they never expected to practice. To accustom them to exposure, which a dozen years later would be considered downwright foolery. To rear children thus for the slaughter pen, and then lay it to Heaven, is too bad.

A Rapid Cure for Tapeworm.—A. J. Schafish, of Washington, says that in treating some cases of tapeworm he employed no preliminary provisions beyond forbidding the patient to take any breakfast the day on which it is intended to remove the worm, and giving him a large dose of Rochelle salts the preceding night. At 10 o'clock in the morning he had the following at one dose: Recipe, bark of pomegranite root, ½ ounce; pumpkin seed one-half dram; ethereal extract of male fern, 1 dram; powdered ergot ½ dram; powdered gum-arabic, 2 drams; croton-oil 2 drops. The pomegranate bark and pumpkin-seed were thoroughly bruised, and, with the ergot, boiled in 8 ounces of water for fifteen minutes, then strained through a coarse cloth. The croton oil was first rubbed up with the acacia and extract of male fern, and then formed into a emulsion with the decoction. In each case the worm was expelled alive and entire within two hours. No unpleasant effects followed. In each case the worm was passed with the head firmly fastened to the side of its body at about the widest part, from which it was with difficulty removed; and the worm was twisted and doubled into various knots.—*The Druggists' Circular.*

Catarrh Remedy.—Take a wide-mouthed glass bottle loosely filled with cotton and pour on it the following mixture: Pure carbolic acid, 80 grains, aqua ammonia (sp. gr. 0.96) 90 grains, distilled water 160 grains, rectified spirits of wine, 80 grains. Inhale frequently through the nose and now and then into the mouth.

Domestic Economy.

The Reason Why.

Why does boiling fast render meat hard?

Because the excessive action of heat causes the albumen of the meat to set solid, crisp up the fleshy fibres, and prevents heat having a gradual access to the interior.

Why, when a good soup or broth is required, should the meat be put into cold water?

Because, as the heat is developed very gradually, there occurs an intermixture between the juices of the flesh and external matter. The solnble and savory part of the meat escapes and enriches the soup.

Why are stews generally healthful and digestible?

Because, being compounds of various substances, they contain all the elements of nutrition, and as the office of the stomach is to liquify solid food before digesting it, the previous stewing assists the stomach in this particular.

What causes the cracking noise when lard is put into a frying pan?

Lard always contains some portion of water, and it is the expansion of that water into steam, forcing its way through the fat, which causes the cracking noise. The heat at which fat or oil boils is much greater than water. When the cracking ceases the water is gone, and when the fat bubbles its heat is very high.

Why should fish or meat that is being fried be frequently turned?

Because the turning assists the evaporation of the water. When the fish or meat is allowed to lie too long steam is generated under it, and the steam is driven off, the surface catches to the hot pan and becomes burnt and broken.

Why is broiled meat so juicy and savory?

Because the action of the fire hardening its surface seals up the pores through which the juices might escape. A fork should not be used for turning it as the tines open a way for the escape of the juices, thus wasting the best part of the meat.

Why should the water upon cabbage be changed in cooking?

Because (according to Dr. Paris) cabbage contains an essential oil which is apt to produce bad effects, and he recommends that it should be boiled in two successive waters, till it is soft and digestible.

Pop Corn—Every farmer should provide this cheap luxury; see that the boys have a patch, and let the young folks indulge in it freely. It is good for wormy children, good for all persons having dropsical habits, waterbrash, dyspepsia, etc. It is good pounded in a mortar, or ground and soaked in milk, or made into a cake, or mush. It is pleasant eating for most folks, especially for those having good teeth. It is quite a treat when young folks have company in the evening. It keeps well after it is parched. Make pop-corn candy; it is much healthier than colored sugar for children.

Jellies.—In making jellies of apricots, quinces, peaches, apples or plums, peel, remove the stones or cores, cut in pieces, cover with water, and boil gently till well cooked; then strain the juice gently through a jelly bag and add a half pint of sugar to a pint of juice. For berries, a pound of sugar to a pint of juice; boil till it ropes from the spoon, or from fifteen to twenty minutes. In making raspberry jelly use one-third currants and two-thirds raspberries.

Breakfast Bisquit.—Take a piece of risen bread dough, and work into it one beaten egg and a teaspoonful of butter or lard. When it is thoroughly amalgamated, flour your hands and make it into balls the size of an egg; rub a tin over with milk, and set them in a quick oven for twenty minutes, and serve them hot for breakfast. When eaten, break them open: to cut would make them heavy.

Artificial Oysters.—Take green corn, grate it in a dish; to one pint of this add one egg well beaten, a small teacup of flour, half a cup of butter, salt and pepper, and mix them well together. A tablespoonful of the batter will make the size of an oyster. Fry them a light brown, and when done, butter them. Cream, if it can be procured, is better than butter.

Sweet Pickles.—Twelve pounds of fruit, six pounds of sugar, and a quart of cider-vinegar, cloves and cinnamon. Let the fruit boil in above until soft; take out, put carefully on a dish, let the syrup boil down, then put on fruit again and boil a few minutes; fill jars and seal with tissue paper dipped in white of egg.

Plum Preserve.—Plums are equally good done in molasses as sugar. If sugar is used, take an equal quantity of fruit and sugar. Make a clear syrup and boil the plums gently forty minutes. They will require heating over once if to be kept.

Jelly Cake.—Take three eggs, one cup of sugar, two-thirds cup of milk, two cups flour, a piece of butter the size of a butternut, two even teaspooneful of cream of tartar, and one even teaspoonful of soda. This makes an excellent jelly cake, and does not break when taken from the pan.

Pound Cake.—One cup of sugar, one-half cup of butter, one cup of flour, and three eggs beaten separately. This makes one loaf.

MINING AND SCIENTIFIC PRESS

DEWEY & CO., Publishers.

A. T. DEWEY, W. B. EWER, GEO. H. STRONG JNO. L. BOONE

W. B. EWER.....SENIOR EDITOR.

Office, No. 224 Sansome St., S. E. Corner of California St., San Francisco.

SUBSCRIPTIONS payable in advance—For one year, $4; six months, $2.25; three months, $1.26. Remittances by registered letters or P. O. orders at our risk.

Saturday Morning, Oct. 24, 1874

TABLE OF CONTENTS.

GENERAL EDITORIALS.—Mill Building; Academy of Sciences; Device for Removing and Transplanting trees, 257. Osage Orange or Bois d'Arc; AVisit to the State University; Our Bullion Product, 264. The Chilian International Exposition; California in the Miocene Epoch; Copper in Liverpool, 265. Aleut Mummies; Apple Worm in California; Patents and Inventions, 268. The Eureka Mine, 269.

ILLUSTRATIONS.—Ground Plan of Mill; Elevation of Mill; Device for Moving Plants, 257. The Chilian Internetionel Exposition Building for 1876, 265.

CORRESPONDENCE.—Chrome Ore, 258.

MECHANICAL PROGRESS.—The Chemistry of Building Stone; Machine Wanted; New Rig for Three-Masted Schooners; Removing Trees by Steam; Improving Brittle Iron; New Application of Electricity on Railroads; Measuring the Stars; Improvements in Puddling; Tellurium; Mechanical Vibration; Retarding Rust; Mechanical Treatment of Metal, 259.

SCIENTIFIC PROGRESS.—Prizes Offered by the Dutch Society of Science; Scientific and Mechanical Prizes; Passenger Transit; Constants of Nature; Crystallized Bismuth; A Railway Lamp Wanted; Cat Tail Paper, 259.

MINING STOCK MARKET.—Teble of Daily Sales and Prices and Comparative Prices for the Week; Notices of Assessments; Meetings and Dividends; Review of Stock Market for the Week, 260.

MINING SUMMARY from various counties in California, Nevada, Idaho, Utah, Colorado and Arizona, 260-61.

USEFUL INFORMATION.—Mixing Putty; How Imitation of Gold is Made; Marbling; To Prevent Rusting; Fastening Leather upon Metals; Removing Nitric Acid Stains; Faeteet Steaming and Racing; Utilizing Carbolic Acid; Experimental Cremation, 263.

GOOD HEALTH.—Milk Diet in the Treatment of Diseaes of the Heart; The Benefits of Exercise; Bee Stings; Hay Fever and its Cause; Why Children Die; A Rapid Cure for Tapeworm; Catarrh Remedy, 263.

DOMESTIC ECONOMY.—The Reason Why; Pop Corn; Jellies; Breakfast Biscuit; Artificial Oysters; Sweet Pickles; Plum Preserve; Jelly Cake; Pound Cake, 263.

MISCELLANEOUS—Down in a Silver Mine; The New York Mine; Eureka County, Nevada, 258. The Separation of Ores by Magnetic Power; Wages in Europe and the United States; The Black Hills; The Pine Mountain Mines; The Microscopical Society; Removal of Trustees; Columbia District; Chinese Civilization; Powder Making in California, 262. The Great Belcher Air-Shaft; The Trades in San Francisco; The Briggs and Gregory Mines; Santa Barbara Quicksilver Mines; Imitating Marble by Slete; Ore Shipment, 266.

Osage Orange, or Bois d'Arc.

Some months since, Mr. C. D. Gibbes called the attention of Californians, through the Academy of Sciences, to the Bois d'Arc or Osage orange (Maclura aurantiaca), both for hedges and for timber. He said he had seen it in its native State, in the swamps of the Bois d'Arc fork of Trinity river, Texas, where it grows to the hight of 60 or 70 feet, with a diameter of two or three feet, and is one of the most beautiful of the native tress. The wood is one of the most durable in the world, and is remarkably strong, elastic and tough. It is of a beautiful yellow color, closs grained, and receives a free polish, making it valuable for furnitures. In Texas it is used for wagon wheels, as it is not liable to shrink.

For ship-building, Mr. Gibbes stated that this wood is preferable to live oak, and by Indians is preferred for bows to all other wood. It also yields a yellow dye. For an ornamental tree, it is one of the most graceful, with its dark-green foliage and hard, smooth bark, drooping branches and large, orange-colored fruit. It forms a good belt of hedge-row for sheltering gardens, vineyards or orchards, being of a rapid growth and bearing formidable thorns for hedges. A plantation of osage orange set out now, would, in a few years, afford a most valuable timber that would pay well, as it sprouts rapidly from the stump and soon renews the timber ent.

At the last meeting of the Academy of Sciences, Mr. Gibbes exhibited some of this wood, which had been sent to the Academy by Dr. R. K. Reid of Stockton. Some of the wood had been polished, showing a beautiful grain. Some cloth dyed with the dye from this wood was also shown. The dye is of a bright yellow color. Mr. Gibbes again called the attention of our land-owners to the importance and value of cultivating plantations of this tree for timber. In swampy soil it grows very rapidly, and in our swamp land, firm enough to produce sycamore and willow, it would do well. It requires a good, moist soil, but not too wet. This tree could be used to great advantage in strengthening levees on the tulee land, where it would not only be valuable for timber, fuel and shade, but also for forming a substantial protection to the levees, strengthening them and assisting to hold them in position.

A Visit to the State University.

We took occasion on Friday last to visit the State University, at Berkley, to listen to a special lecture by Prof. Hilgard, on agricultural education, and to note the progress that is being made for the general advancement of the institution. The lecture was delivered before the entire body of the students, the faculty, several of the regents, and others who had been invited to be present.

The Address.

The lecture was well received, and did justice to the important subject discussed. Professor Hilgard is a teacher and investigator rather than an orator; but all who listen to him quickly perceive that he is well acquainted with whatever subject he may have in hand. We regret that our limited space will not allow us to give the lecture in full.

Agricultural Education.

The Professor commenced by remarking that the subject of agricultural education, or rather of what it should consist, has been the subject of much discussion of late in all parts of the country. In many institutions it has been made a kind of "Botany Bay" into which have been shipped all who were desirous of shirking honest work at the university. Such views, however, are the result of a grievous misapprehension of the importance of agricultural education. A proper and successful prosecution of agricultural studies requires the closet application, and the supervision of such study the attention of scientific men of the highest culture. It is with the greatest difficulty that the advances made in agriculture are inculcated or acquired. Agricultural phenomena are of the most complex character, and involve a thorough knowledge of nearly all the sciences.

Agricultural Experiments, Etc.

Allusion was made to the difficulties attending agricultural experiments, and their great importance. One can scarcely imagine the care which has to be exercised, or the difficulties in the way of arriving at correct conclusions. Much is yet hidden from us, which, by continued, experiment and laborious research, will eventually be placed before the world for future study and practical advantage.

It should be no part of the work of a university to teach students how to plow and dig; such work they should be taught at home. The university should simply explain what should be done on the farm; thoroughly instil into the mind of the student the principles upon which agriculture is founded, and awaken in him a taste and love for the calling. Labor should be dignified in the eye of the student, and a distinction made between educated and ignorant labor. Muscle cannot be made equal to mind. The educated agriculturist can and should occupy as prominent a place in the world as any other person of like culture.

The lecturer gave a lengthy review of what science has done for agriculture in preventing exhaustion of the soil, improving the modes of tillage where by an increased yield was secured, and closed with some general and pertinent applications of the subject.

A Little Talk.

At the close of the lecture a portion of the faculty and the regents, and, per invitation, some others interested in the cause of practical education, repaired to the room occupied by the Faculty, where an hour or more was pleasantly and we trust profitably spent in a little social conversation and interchange of views with regard to the general interests of education and the special efforts now being made at the State University to carry out the cherished objects of the people in rendering the Agricultural and Mechanics' Arts Colleges a practical success. We apprehend that one great difficulty in the way of such a result, and the chief cause of the present antagonism of feeling between the people at large and the management of this institution comes from lack of a proper understanding between the two. Whatever may have been the disposition of the Regents in times past we feel well assured that an honest and earnest effort is now being made to render these important and primary departments of our State University what it was originally intended by the general government and the people they should be.

The College of Agriculture.

To satisfy ourselves and our readers more particularly in this direction—that the Regents are trying to improve the College of Agriculture as rapidly as an empty treasury will admit, we took a walk over the grounds, accompanied by Mr. R. E. C. Stearns, the Secretary of the Board of Regents, and Mr. J. W. A. Wright, Lecturer of the state Grange of Patrons of Husbandry. We found that active measures are being taken to improve the grounds and prepare them for the illustration of agricultural and horticultural work, and were assured that the relation of this work to the instruction in the University will be made as close as possible. Students enrolled in the Colleges of Agriculture will be required to become familiar with their operations.

The grounds have been placed as required by the organic act, under charge of the Secretary of the Board of Regents, who is a practical agriculturist, and of all men in the State most eminently qualified to fill that position. He is most ably seconded by the gardener, Mr. John Ellis, who thoroughly understands his business. A convenient propagating and green house, with all necessary appurtenances, has already been constructed, and a tract of ground laid off and properly prepared for gardening and horticultural purposes. Other portions have been set apart for orchard and forestry and for general farming purposes. These are now being prepared for active work as soon as the season opens. A large barn has been constructed at a point convenient to the farm work. Every thing appears to have been done with good taste and judgment, and in a spirit of economy unaccompanied with niggardness. All who are interested in the progress of this work, or who have heretofore been inclined to utter complaints at the slowness with which it has been entered upon, should now go and observe for themselves.

Work in Other Directions

Is also being prosecuted with most commendable dispatch. Halls or cottages for the accommodation of the students have been erected; five in number, most substantial and convenient. Each cottage will accommodate ten students, at a rental of $30 per year, for each person. Two of these cottages have been set apart for the young ladies, and have been erected at opposite extremities of the ground from those designed for young gentlemen. Houses for professors have been erected in immediate contiguity to the cottages for students.

Mechanic Arts.

Instruction in mechanic arts is given by Professor Le Conte, and in engineering by Professor Soule. In the development of this department special attention is very properly given to industrial and mechanical drawing in distinction from artistic drawing. An acquaintance with this exact art is indispensable to high attainment in mechanic arts. The services of Mr. John D. Hoffman, educated at the Polytechnic School, at Carlsruhe, have been secured for this specialty.

Manual Labor.

The labor of the students is utilized so far as possible, in all the work about the institution and its grounds, for which a fair compensation is allowed. A printing office has also been set up in one of the buildings, in which over forty students are already employed more or less of their time. This office will soon be greatly enlarged, and put in condition to do all all kinds of book and most other work. Stereotyping will no doubt soon form one of its most useful features. Those who desire to learn the art of telegraphy have excellent opportunities for doing so. A machine shop with steam power are among the contemplations of the early future.

Notwithstanding the opinion of one of the Regents to the contrary, as expressed in our "little talk" in the Faculty room, we saw abundant evidence in the printing office, and in and about the grounds that the students were both inclined and able to unite manual labor with their studies, both as a means of aid to their support at ths institution, and as a matter of practical study in mechanic and agricultural arts. Of course the power to do this while maintaining a good rank as scholars, varies much with the individual.

Conclusion.

We would like to say much more with regard to what we saw and heard during this interesting visit to the State University, but neither time nor space will admit. We would simply add in conclusion that the visit and inspection was a most satisfactory one, so far as we could make up our minds to let by-gones alone. Looking to the future we have hope and confidence in the university, and believe that the management is disposed to give the fullest efficiency to *all* the various colleges—those based upon the application of science to the useful arts as well as to those which look more directly to what are termed mere classical attainments. The present total number of students is 228, of whom 37 are young ladies. There is no preparatory class now connected with the University.

W. S. VAN DEELEN'S stage line from Elko to Eureka carries passengers for $10, and the travel is principally performed by day, thus affording an opportunity for the passengers to observe the mountain scenery and avoiding the disagreeable all-night stage ride. This line leaves Elko every other day immediately upon the arrival of the western bound train. Passengers from the West will save $2.50 by this line, and those from the East $7.50 in fare, and also a good deal of valuable sleep. Passengers are provided with a good, comfortable coach, good breakfast and supper, and kind and obliging drivers.

CONNECTION MADE.—Connection has been made between the narrow and the old tunnel of the Sierra Nevada mining company at the Sacramento chimney. The first survey was 56 feet out of the way. They are now ready to begin the extraction of ore from the deposits worked in the early days of the mine.

THEY are to have a telegraph to the Panamint mines.

Our Bullion Product.

The bullion production of the Pacific coast has within the past few years assumed proportions large enough to astonish the world. The sum total, while decreasing in some States, is increasing in others, so that each year shows an increase in the aggregate amount produced. Last year the product was as follows: California, $18,052,722; Nevada, $35,254,507; Oregon, $1,376,389; Washington, $209,395; Idaho, $2,343,654; Montana, $3,892,810; Utah, $4,106,331; Arizona, $47,778; Colorado, $4,083,568; Mexico (West Coast), $866,798; total, $72,258,693. During the year 1872, the total product from these same States and Territories amounted to $62,236,913; showing an increase of over ten millions of dollars for 1873. The yield in 1871 was $58,284,029; about $4,000,000 less than in 1872. Thus, in two years the increase was over $14,000,000. During the three years preceding this, the Pacific coast produced $192,779,035, in hard cash.

During 1873 there was produced in gold bullion, $27,707,059; in silver, $34,315,750; hass bullion, $10,235,884. The production of gold declined $2,721,699; of which $1,000,000 was in California. The mining dividends of which there was any record amounted in 1873 to the sum of $13,356,000, from sums quoted on our stock boards. The assessments during the same time amounted to $6,729,743, leaving a profit to stockholders of $6,626,257, or over $500,000 a month during the year. The total dividends paid in 1872 were $6,731,100; so that 1873 showed an increase of $6,614,900, or about 50 per cent. When we remember that in 1871 the total dividends only amounted to $4,837,950, we can appreciate ths result of last year's operations. This year the dividend will be much heavier. The dividends for last month were larger than any corresponding month in the last ten years. This year, up to the present time, the coinage at our mint has been larger than ever before. For the past nine months of the year it was $19,942,000; as compared with $15,442,900 in 1873; and $11,524,000 in 1872. The receipts of treasure through Wells, Fargo & Company's express, in this city, during the first nine months of this year, is shown in the *Commercial Herald*, in the following table:

THE UNIVERSITY MUSEUM.—Mr. Jas. D. Keene, of the Board of Brokers, has purchased the valuable collection of minerals made by Mr. H. G. Hanks, and has generously given it to the Department of Mining and Engineering of the University, which is presided over by Prof. Wm. Ashburner. The value of the collection is estimated at $7,000. Mr. Hanks' collection of minerals is the finest on the Pacific coast. It is not only valuable from its extent and the beauty of the specimens, but it is arranged in a scientific manner, and the specimens are properly identified and labeled. This collection, added to that made by the Geological Survey, the Mills' cabinet, and the Pioche cabinet, will make the University museum a magnificent one. It is a pity that funds have not been appropriated to have the collection of the Geological Survey arranged and displayed. It will take some time to classify and arrange it, and the work should be commenced as soon as practicable.

JAMES HILL has discovered coal in large quantities in the neighborhood of his property, near Suscol. The coal is said to be equal in quality, if not superior, to that of the Mount Diablo coal mines.

THE chills and fever are driving the Chinese miners away from the Oroville mines. Large numbers pass down on the cars every day.

TEN THOUSAND tons of steel rails have been ordered by the Central Pacific railroad company for the mountain sections.

The Chilian International Exposition.

The Government nf Chili propose holding a grand International Exhibition at Santiago, Chili, September, 1875. The building in which this exposition will he held—a reprssentation nf which is shnwn nn this page—will be architecturally a very handsome structurc. It is now nearly finished, and will be thoronghly complete in sll its parts and fitted for the reception of exhibits. Besides the main building, there will be several tent-liks structnres for special exhibits in the spacions, grand old city nf Santiago, where the palace is located. As the time within which applications can hc mads is very short—they having to reach Santiago by the 15th of January—and as the energetic Consnl-General is hard at work trying to awake the peopls of our Coast to the importance nf a full exhibit of all our productions, we call the attention of onr mining men to the circular recently issned by Senor Casanneva, with respect to mineral exhibits. He is very desirous that the mines of the Pacific coast be well represented, and asks for specimens of ore, details of working, etc.

These specimens should be labeled with the name of ths mine, the district, connty and Stats wherein located, with an account of the net yield of the ore per ton; and this information relative to the mineral collection for the Pacific Coast will be translated into Spanish, and recorded in the Register of the National Museum of Chili. They will be duly forwarded to the Exhibition, and at its close will be removed to the said museum at Santiago, and there remain preserved in glass-cases provided for that purpose.

In the earlier history of California as a gold-producing country, Chilian capital was largely invested in the minee of the State, hut lately hae been diverted to other pnrposee. Within the past eighteen months Chilian capital to the extent of $15,000,000 hae been invested in the lately discovered mines of the Chilian and Bolivian deeert, and it needs but a good showing to call the atteution of Chilian capitalists to the mines of California and neighhoring Statos. The President of the Executive committee of the exhibition hae addressed a circular to the miners of Chili, asking their co-oporation in forming a similar collection from the mines of that Repnblic, to be placed in jnxtaposition to that from the Pacific coast. This will enable the Jndicial cnmmittee, composed of Americans and Chilians, to decide on the respective merits of the two collections. Contributore to thie collection of minerals are requested to carefully pack their specimene in strong hoxes, not exceeding 12x20 inches in eize, marked: "For the International Exhibition of Chili." and addressed to the "Conenl-General of Chili, at San Francieco; care Welle, Fargo & Co." (through which company no freight will he charged to exhibitors). It is to be hoped that our manufactnrers and mechanics will take some trouble to make a good representation at this exhibition, and that onr miners will do likewise. The importance of euch expositions ie so well known that it needs no comment. In Chili, particularly, where we eend large amonnte of goods, California ehonld be well represented, and preparations ehonld be made at once by those who intend to make exhibits. The San Francisco *Journal of Commerce*, which made a very creditable display of Pacific coast products at our late Mechanics' Fair, has already applied for a large and commodious space where samples and models of everything that is manufactured nr sold in this city, may be exhibited in attractive form, and all brought together in a convenient space, where they may be examined leisurely, and without giving visitors the trouble to wander here and there in search of a particular exhibit. They will have a competent representative to explain the details of the exhibit, which gives parties inteuding to make a displa- a good chance to show their wares at little expense.

California in the Miocene Epoch.

In onr issuc of October 10th, we gave the remarks made before the California Academy of Science by Dr. J. G. Cooper on "California iu the nliocene epoch." At the last meeting of the Academy Dr. Cooper mads some remarks on "California in the miocene epoch," which we give as follows:

Unlike the pliocene which I spoke of at our lest meeting, the miocene in California furnishes us, so far, with no *certain* evidence of land animal's existence, and few of vegetable life. It is, however, most probable that snch existed, and will in time be determined or distingoished from the pliocene with which they are now mixed. That there was au extensive and most interesting terrestrial fauna in the adjoining regions of Eastern Oregon, Wyoming and Utah has been proved by the treasures of animal remains found within ten yesrs past in those regions, to ennmerate merely the names of which now would take up too much time.

As there was much less lsnd above water in this part of the continent during the miocene, the field for such animals to exist iu was much more limited than in the pliocene, and therefore, their history requires longer time to work out. Besides this, the convulsions and removals of animal relics from their original beds, during the volcanic and glacial periods, were so general as to mix them up in a macner too puzzling to be deciphered for a long time to come. An iustance of this is ehown by the tooth of an *Archegosaurus* found by me on Mare Ieland, eome years since, and mentioned in our Proceedinge, Vol. V., p 191. This tooth, identified by the lamented Agassiz, belonged to an animal believed to have been one of the earliest reptilian forms known, and charactorizing the carboniferous age. It was an enormous development of the strange "four-legged fish," or larval salamanders still found in the Columbia river and other western waters; but mnet have been 20 feet long, and no similar remains are found in any late formations. Though it is not *certain* that they may not be yet found to have exieted among the monsters of the pliocene epoch on this coast, as their snpposed descendante live in our fresh waters, still the evidence of this single tooth would have gone far to prove the age of Mare Island to be carboniferone if no other foseils had been found there. As it happene, however, to be one of the richest fossil-beds of pliocene remains in California, the single tooth found on the eurface of that formation was probably transported by ice from the Sierra Nevada, where the nearest carboniferous etrata are known to exist. Of conrse the same may be the caee with eome of the pliocene remains, and poseibly others elsewhere. But the peculiar position of Mare Island makee it the most likely place for euch mixtures, as it liee just where the outlet of pliocene or post-pliocene lakes or rivers must once have met a great obstruclion to their flow. On this animale embedded in floating ice would naturally lodge and decay, just as the celebrated extinct elephant nf Siberia was carried by ice to its resting place at the mouth of an Arctic river. The obstrnction referred to was no doubt an elevation of the Mt. Diablo ridge, crossing the Straits of Carqninez at this point, dering the volcanic period before mentioned. By this pliocene beds were made to acenmulate to a depth of over 50 ft., which they still show on the adjoining shores, though the rivers have washed away the obstruction itself, and the greater part of these beds also.

The fossil evidence which we possess relating to the miocene epoch in Californiа is, however, abundant and interesting. It so far consists of beds of marine shells, fonud at short intervals thoughout the coast range and the foothills of the Sierra Nevada, which contain the proper proportion of living spccies to prove their age as relatively older than the pliocene. From their comparatively recent date, it is not generally difficelt to recognize and follow out these beds throughout their extent though much more disturbed and altered by volcanic action than the pliocene. In some places, however, the contact of eruptive rocks or infiltration of foreign mineral matter hy hot springs, has altered them past recognition, though for only limited tracts south of this body.

From these marine beds we find that nearly the whole of the coast ranges south of here were under the sea in the miocene, and the evidences of extensive washing away of the strata are so plain that it is not improbable that the *whole* were submerged.

Beds of excellent miocene, and, possibly, pliocene fossils, are found at the mouth of Kern river cañon, showing that the sea then washed freely against the foot of the Sierra; there is even reason for believing that it extended far up the Colorado river basin; and certainly it deposited a thick bed of the enormous miocene oyster (O. Titan), with other remains, along the west shore of the present Colorado desert, now at an elevation of probably 1,000 feet. Of its extent in the northwest quarter of California, very little is known, and probably most of that region was above water.

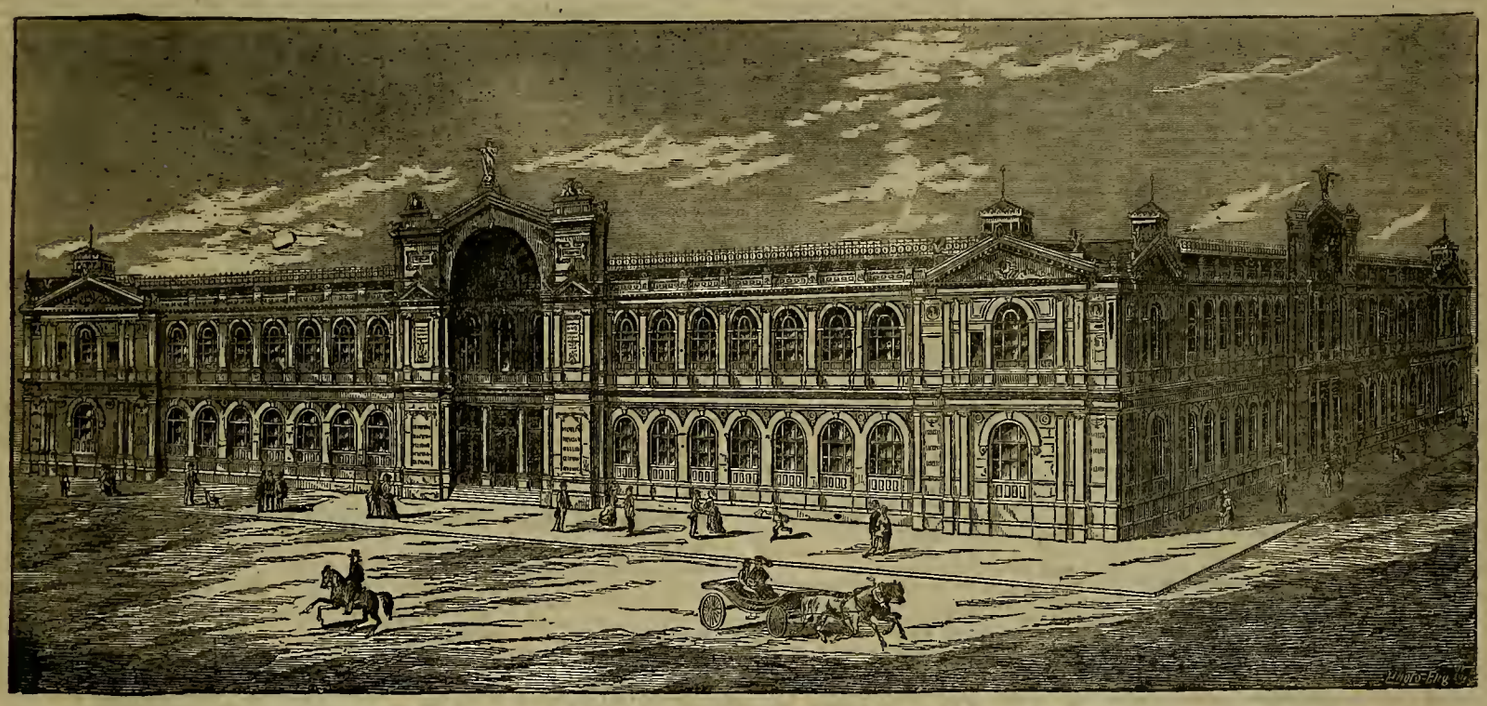
As these changes of level were caused by depression of the land below its present level, our mountains were then probably quite insignificant, and no doubt a much more level and uniform surface prevailed on shore. As the miocene was elsewhere the culminating period of exietence for the large and strange tertiary mammals, it is altogether probable that some of them inhabited portions of the dry land of California, connected with the regions in which they were so abundant in the north; but so far the geological surveys have not been sufficient to define their limits, either in time or space, within this State.

That marine monsters frequented our shores, is proved by the remains of seals, whales and still undescribed creaturee of enormous size, that have been fonud in this formation in the coast range, even more abundantly than in the pliocene. From the great difficulty of obtaining their stone-imbedded relics, there will be work for future generations of studeuts in describing them. From these animal remaine (many of which were only of microscopic size), was produced the petroleum of this coast, a substance so far found only in the miocene period strata of California.

Of the miocene flora as distingushed from the pliocene in California, we know very little. It was apparently of a lese tropical character, more like that of the present time, and probably resembled ours now living as nearly as any other. Beds of lignite, four feet thick, but poor in quality, are common near the coast, containing wood and algæ.

The northern hemisphere seems to have had in the miocene epoch a very uniform climate, in which the vegetation of Europe resembled that now in our Eastern States. The most wonderful fact connected with it is, that recent discoveries have proved that Greenland, in lat. 70°, and Spitzbergen, in lat. 78° 58′, had a rich luxuriant forest of trees, mostly American in character, among them a Redwood, nudistinguishable from that so common here! In all 137 species are known. It is impossible to reconcile this with the existance of even four months night which we know must prevail so near the pole, even if the climate there were tropical. We are forced to the conclusion in spite of astronomical opinions, that the poles have changed since then, and this may help to explain many geological puzzles both in California and elsewhere. Among these the supposed absence of all EOCENE animal or vegetable remains on this coast is one which might be accounted for by supposing that in that epoch California was under covering of polar ice! Such a theory, though it may be called absurd on account of the present flattening of the poles by centrifrngal force, is as tenable as that of the well known alternations of deep ocean and dry land which geology proves to have occurred on our continent. I may mention in this connection, that Pry Dana saw reasons during his explorations of the Oceanic Archipelago, to believe that it has been slowly subsiding from the condition of a continent in the miocene and pliocene epochs, while this coast has been rising. Thus alternations of land and ocean have doubtless been going on, usually slow and gradual, since the creation of the world. The changes in fauna and flora, which in our limited field of view seem to have been sudden and convulsive, were probably nearly all through the tertiary, as slow as at present, but from these enormous undulations of the earths' surface half of their history is for ne buried beneath a fathomless abyss.

Would changee of the poles be any more wonderful or impossible?



THE CHILIAN INTERNATIONAL EXPOSITION BUILDING AT SANTIAGO, 1875.

COPPER IN LIVERPOOL.—Copper was quoted on the 1st inst. in Liverpool, accordiug to Lewis & Sone' Report on oree and metals, as follows; Good ordinary hard, £81 and £81 10s per ton on the spot; especial brands, £82; ore, 16s, and regulue 18s 6d per unit. Transactions in bare, during the latter part of September, were on a moderate scale, consumers being disinclined to pay the advanced prices. The charters advised during the month, amounted to only 3,100 tons. Chili exporte to the 15th of September, from the first of the year, amounted to 37,126 tons fine. Stocks of West Coast produce were estimated on the 1st inst. at 14,814 tons fine, against 16,944 on the 1st of September.

LEAD has been very firm in Liverpool for the month past, and owing to the disturbances in Spain has steadily advanced, though there is not a very large demand; good ordinary brands were quoted on the 1st inst. at £21 15s to £22, and £20 10s £20 15s per ton for eoft silver.

THE CHOLLAR mine on the Comstock is turning out ore from the old works, which in early days would not pay for reduction, but which will now, under improved facilities, return a fair compensation.

THE Virginia and Truckee railroad is being put in the best possible order for the coming winter, throughout its whole length.

The Great Belcher Air-Shaft.

The big air-shaft of the Belcher mining company ie now completed to the depth of 1,000 feet. The shaft is over 100 yards to the northward of the hoisting works and msin engine ehaft, and is heing sunk in the solid weet country rock.

The size of the excavation made in the rock ie 8x14 feet. Thie, when timhered up, gives two compartments, each 6x6 feet in size. Where the rock is hard and perfectly eolid the shaft ie cribbed with timbere 6x12 inches in eize; hut where it is soft or inclined to swell it ie timhered in sets, timbere 12 inchee square being nsed. All of thie work ie done in the most subetsntisl msnner possihle.

From the surface to the 1,000-ft level the shaft is carried down vertically, but from this point it will he on an incline corresponding to the dip of the ledge, which ie ahont 36 degrees and to the east. The portion of the shaft which is carried down on an incline will he kept in the weet country rock, lying back of the ledge. The object in keeping iu this rock is to avoid ground that would be liable to swell and crush in the sides of the ehaft.

Once the ehsft shall have been completed, the compeny want to have no further trouble with it. Repsire to main mining shafts are much more expensive than moet pereone imagine. There is not a main engine shaft on the Comstock lode that has not cost its owners ten imes as much for repairs ae was paid out for ts original sinking.

The ground in which the Belcher compsny are sinking their huge air-sheft is excellent throughout. The npper stratum is a epecies of very firm porphyry, which extends down to the 1,100-ft. level, where blsck dike—very hard and flinty—eets in. This rock works hard, but it will stand for ages; therefore when the work ie once finiehed, it is done for all time.

Work on the ehaft is now progressing at four eeveral points—at the 1,000, at the 1,100, at the 1,200-ft level, and half way between the 1,200 and 1,300-ft. levels. They will shortly begin work on it at the track floor of the 1,300-ft. level—just as eoon as thet portion of the mine ehall have cooled off a little more—snd also at a point half way between the 1,100 and the 1,200-ft. levele. Drifte are now being run at these half-way stations to reach the line of the work, and eome of theee have nearly reached their destined point.

The great ehsft will he pushed down to the 1,500-ft. level as rapidly as possihle. It will not etop there, however, but as other levels are opened below it will be carried on down with the other openings of the mine.

The rock taken out in excevating the shaft is not hoisted to the surfsce, as some may euppose, but is used on the various levels in filling in ground that has heen worked out. This gives support to the several sections of the mine, and in thus disposing of the waste extracted in excavating the shaft, they are "killing two hirds with one stone."

As the shaft is about being attacked in so many points it will not be long before it will have reached the bottom of the mine—the 1,500-ft. level.

The rapidity with which the ehaft was carried down from the surfsce to the 900-ft. level is unprecedented in the history of mining operations on the Comstock lode. Ground was hroken May 25, and the shaft reached the level named September 19—less than four months from the day of starting.

Henry Donnelly, foreman of the mine, has taken great interest in this shaft from its inception, and it was iu great part owing to his exertione and excellent management that we are ahle to chronicle the rapid progress mentioned above.

To make the surveye required was a feat in engineering very diffioult of accomplishment. There were many great and peculiar diffionlties to he overcome in locating the shaft and in ascertaining the exact pointe at which work wse to be commenced upon the several sectione between the surface and the 1,000-foot level, for gange of men were engaged in sinking and raising in various placee at one and the same time. As a proof of the acouracy of the surveys, we may etate that the several portione of the ehaft osme together to an inch. One may now stand at the 1,000-foot level and gazo upwerd toward the emall, square speck of daylight visible at the top, and all the way is seen one smooth, unhroken line. The ehaft ie ae true and straight as a gun-harrel.

The surveys were all make by I. E. James, the well-known civil engineer, and surveyors will appreciate some of the difficulties he encountered when we say that to etart in with no needle could he used, and as no accurate hearing was to he had it was a very intricate problem to get the exact bearing of lines below. In the 850-foot level it wae necessary to take no less than sixteen courses from the old shaft to the new, and at the 900-foot level the great number of thirty-one courees had to be taken to get the exact point at which the ehaft was to be locsted.

The ehaft has already proved of immense value to the compsny in the way of ventilating their mine. All the levels down to the 1100 are now perfectly cool and comfortahle. Pure and fresh air abounds almost everywhere, and in eome places where there is a strong draught, it is almost too cool for comfort. One man cau now do about as much work on the 1100-foot level ae was formerly done by three. We yesterday passed through all the levele down to the 1100, and were astoniehed at the chsnge in tempereture ohservahle everywhere. Where all wss steaming and stifling on the occseion of our last visit, previous to the opening of the air shaft, we yesterdey found sll dry snd as cool as the air at the surface.

The new shaft ie fast cooling the levels below the 1100—even down to the 1300-foot level it is gradually drawing off the hested air and cooling the rock. It is thought that when it shall have heen carried down to the 1500-foot level it will render thst and those next above as comfortable as at present are the levels above the 1100.

The miners are delighted with the chsnge in the temperature of the mine. A few weeke since the best men in the mine were leaving as fset ae they could find places in other minee where the heat was not so great; nnw men from the other minee sre glad to find places in the Belcher.

We lsck epace in which to spesk fully of the vsrious and vast benefits that have already heen derived from the shaft, incomplete ae it is, without attempting to mention those yet to come. It would seem thst the problem of the ventilation of our minee is at lsst about to be eatisfactorily solved, and that thie solution lies in the sinking of spacious air-shafts at proper intervals along the lead, which, resching from tho lowest levels to the surface, shall operate as huge chimneys to draw off the heated air of the regions below.—*Enterprise.*

The Trades in San Francisco.

From an article in the *Call* on the state of lahor, etc., in this city, we extrsct as follows:

The general situation of the mechanics is better in San Francisco st the present time than for eome years past; snd yet from careful inqniry, there are few if any mechenicel branchee in which the number of workmen is not equsl to the demsnd. The new comer will find superior qualities and meritorioue habits an important reliance, and needs to fortify himeelf with a good stock of patieuce and perseverance, and withal the means to maintain himself while awaiting his opportunity. Among the most flouriehing trades at preeent are those pertaining to building enterprise.

The bricklayere in the city are all employed who choose to be. Several very extensive building enterprisee, chief of which is the Palace Hotel, have caused the engagement of about two hundred workmen from the East. This trade, on the average is employed about two-thirds of the time. In the winter they are frequently out of engagements. The etandard rate of wages is $5 a day, some portion working eight hours, according to the rules sdopted hy the union leagnes, but a larger number ten hours.

The carpenters are also generslly employed, to the number of ahout six thousand, which fact gives some indioation of the great magnitude of building operetions at present progressing in the city. The trade work ten hours a day, and the standard wagee for good workmen is $4 a day. A large proportion of the nnmher mentioned, however, receive less.

Of the paintere, nine-tenths are employed, hut the work is irregular, and dnee not cover more than two-thirds of the time, on the average. The wages range from $2.50 to $3.50 a day, while ekillful grainers receive ae high ae $4.00.

The plaeterere all find steady employment at present, working eight hours at $5 a day. There are ahout four hundred in the city.

The lathers receive from $2.50 to $4 a day. There are about 200 in the city, and they are generally employed.

Stone masons are largely dependent upon Government contracts, and the popular style of huildings in the city does not offer an extensive field for the trade. There are ahout 200 here, mostly employed at present, at wages of $4 and $5 a day.

Stone-cutters receive the same ratee. The number in the city is estimated at 300, generally employed.

Mill workmen, engsged in manufacturing huilding material hy machinery, receive from $3.50 to $4 a day. There are hetween 600 and 700 employed in the different mille in the city.

Machiniets are employed at wages ranging from $3 to $6, the average heing $4 a day Few of the trade are idle.

Boiler-makers are generally employed at from $2.50 to $3 a day. There are about 200 in the city.

Of the moulders, many are unemployed at present. Their wages range from $2.50 to $4 a day.

The hlacksmithe are flourishing. They receive $5 a day wagee, and strikers $3.

The ship-carpenters generally find employment here and there; hut their time is irregular. They receive from $4 to $5 a day, and number ahout 250 in the city.

The caulkere have experienced a reign of hard times for many months; hut their prospects have lately improved in a measure. Of ahout 200 in the city, two-thirds are now employed in the city at $2.50 and $3 a day wages.

Of ship-joiners, there are hetween 200 and 300 in the city, generally employed. They receive the same wages as house-carpenters, and a emall portion of skillful workmen as high as $5 a day.

Tannere and curriere number ahout 100. They are all employed, at an average of $4 a day.

Saddlers and hsrness-makere are generally employed, at from $3 to $5 a day.

Tailors usually work hy the niece, making on the average from $4 to $5 a day.

In the printing trade there ie the usual eurplue of compositors common in all large cities and yaoanciee are not of every day occurrence The average wagee range at $20 to $30 a week in the joh and newspaper offices.

Shoemaking business is becoming one of the loet arte in California, eo far ae white mechanice are concerned, the Chinamen encroaching fearfully upon the trade. The wsges sverage about $2 a day, and very few receive above $3.

Cigsr-making is another trade that hae about the same advantage in Ssn Francisco, thst a trade in linen domestics would secure in Alsska. The hnsiness ie almoet exclusively in the hands of the Mongol.

Cabinet making is one of the growing trades, and givee employment to a goodly number. The men generslly work by the piece, and make from $3 to $5 a day.

These oheervatione of a few of the leading trades afford a fair idea of the general eituation snd npportunities of mechanics in San Frsnoieco.

The Day Laborers

Are doing better at present thsn for some yesre past, and it is estimsted tbat between ten and twelve thousand are now employed in grading, peving and huildiug contracte in the city, receiving from $2 to $3 a day. There are many thnusands employed as portere, csr-drivers, and similar pursuits, who are psid on an average from $50 to $60 a month, and, taking this rate of remuncration as a bssie of calculation, are compelled to practice very economical habits of life, particulsrly those who have fsmilies dependent upon them.

The Unemployed

In the city will sggregate ten thousand st any season of the year. This army is composed of adventurers, young men of faetidioue tastes in pureuit of genteel occupetions, principally in the line of clerkebips, and the greet Micawber family generally. A few weeks of waiting snd wstching sufficee to convince them of the great surplus of pereons in the country posessing the same order of talent, and a large proportion of them return in disgust, or eeek other fields, making room for the steady etream following in their tracke, who are anxious to obtain the eame valuable experience. When the dieappointed gentlemen of this clase are unable to effect a retreat, if good fortune attend them, they ultimately drift into an engagement which affords them the means of a bsre sustenance. There ie a vast amount of excellent tslent and education wasting iteelf in conveying dishes in restaurants, mixing oocktails, and like pursuits in San Francisco, that might be employed to eome purpoee in aiding the progress of civilization in more congenial fields. Thie circumetance and other facts above given should he pondered hy intending immigrante. California ie only the land of promise for such as are possessed of the ahilities or means for developing its resources or otherwise advancing its progree.

The Briggs and Gregory Mines.

The Colorado *Register* eays: The Brigge Broe. have 540 conecutive feet on the Brigge and Gregory minee. They have sunk on their old property to a depth of 575 feet on the Briggs crevice and 300 feet on the Gregory. Their principal work ie at a depth of 525 feet, where they have had for more than a year a crevice of paying ore from 12 to 20 feet wide. They have taken out an average of 168 tons per week, which hss yielded from $8¼ to $11 per ton, or from $1,380 to $1,848 per week. They have in addition taken out from 12 to 15 tons of smelting ore per week, one-third of which is firet-class and the balance second-class. The first-class ore selle for an average of $150 per ton, or from $600 to $750 per week. The second-clae from $75 to $100 per ton, making from $600 to $1,000 per week, or a total of from $2,580 to $3,600 per week from all sources. The Gregory crevice is much narrower, hnt is richer. Last week the smelting ore from thie sold for $195 per ton, while the mill ore runs from four to ten ozs. per cord, or from $10½ to $26¼ per ton. Thirty men are employed in the mine; $2½ per dav are paid to miners, and $20 per week to ekilled timherers. The ore is crushed hy a 25-stamp double-issue mill, and as raieed is dumped close to the batteries, so thst no hauling is required. The mine furnishes an ample supply of water for milling purposes. The greater depth of the old property enables them to drift from the bottom of their ehaft directly nnder the new. At the extreme bottom of the main ehaft of the old property the crevice is from eight to 12 feet wide of paying ore, and this continues through the new property, so far as can he seen or judged. The purchase of the latter will require not less 25 additional men, and the erection of 25 more stamps, which will he put up at once. They working very economically and carefully. The amount of quicksilver used annually hy their 25-stamp mill falls short of two tanke. They reason very justly, that where a large amount of quicksilver is loet, gold will be lost with it, and hence they use less.

The tailings from the mill ore are buddled by an automatic apparatus, as they escape from the amalgating tables, yielding from 50 to 60 tons of dressed tailings per month, whioh eell at from $5 to $7 per ton, making a total yield of about $5,000 per annum, which alone ie a nice little income. We are promieed hy them for publication in a few dsys, a detailed account of the amount of ore taken out and the returns from it, together with the workinge of the mine, etc., from the 1st of January last till the present time. These will be very valuable and interesting data.

Santa Barbara Quicksilver Mines.

We tske the following from the Ssnte Barbara *Index* of the 8th inst:

Seven milee north of Ssnta Bsrbsra have been diecovered the richest quicksilver mines of the world; thst is, the aesaye per ton of the ore in the ledges and deposite ae fsr se explored show them to he so. Theee minee have been for several months past quietly visited hy cinnahsr experts in the interest of the leading monied men of the Pacific coast, and the result ie, that, after a eearching examination, a compsny hae heen incorporsted for the purpose of working these mines. The names of the principal cspitslists who have sesisted this enterprise, are as follows: E. L. Sullivsn, Ed. J. Pringle, Hon. J. P. Jones, U. S. Senator; D. D. Colton, Col. Fry, Col. McDowell, J. S. Csesell. This compsny is now fully organized, and have gone to work. Alresdy a graded pack-horse trail has been msde from the mine over the Ssnta Ynez mountains into Santa Barbsra. By this trail horsemen can go from thie city, up and over the mountaine, and down to the minee, in three hours.

To enable the compsny to build furnaces to reduce the ore, and to oonstruct a grsded road from the mine to Santa Barhsra, and to prosecute the work of developing the minee thoroughly, a preliminary assessment of 25 cents upon each of the 100,000 shares of stock has been levied, which will amount to $25,000. Thie ehowe that the company intende to carry on the work of development with energy.

In fact, preparations are now under way for the manufacture of hrick, of which to oonstruct furnsces; and it is claimed by thosé who hsve examined the matter, that a first-rate quslity of fire-clay is found in abundance convenient to the mines, from which a durahle lining for the furnsces can be made. It eeeme ae though nature hsd furnished, near at hand, all the requisites to csrry on the husiness of reducing the oree. There is but one thing wanting in the successful working of the mines, and that is the necessary timber to brace up the exosvatione from which the ore ie extracted. We learn, however, that ahout twenty miles dietant, on the way to Bakersfield, aro forests of white and red pine, that can he reached hy an easy wagon grade. The supply for the Santa Barbara mines will have to come from these forests, or elee to he drawn from northern shipments reaching the wharves of Santa Barhara.

Everything indicates that a rapid development of the Senta Barbara quicksilver minee is about to be carried forward.

The president of the Los Prietoe mining company is Col. Fry, of San Francisco. Mr. Fry is also president of the Crown Point, and also president of the Belcher. The superintendent is Mr. John F. Cassell, an old experienced miner. He ie now in Santa Barhara, meking preparatione to carry on the work with vigor.

The company is compoeed of some of the wealthiest men of this coast. They have ample means for the work, and are determined to make a thorough exsmination of their property, whatever it may coet. They have purchased from the Najalayegua claimants all their right to the land on which the mine ie located, so that the title ie now clear and indieputable.

It will be noticed that among the list of the principal stockholders in thie quicksilver mine, is the name of Hon. John P. Jones, U. S. Senator from the State of Nevada. Mr. Jonee ie represented to be worth several millions of dollars, which hae heen accumulated principally in mining operations in the Washoe mines. Lately he paid over $300,000 for some mines in Panamint, and hae eubecribed $220,000 to the capital stock of the Loe Angeles, Psnamint, and Cerro Gorda narrow-guage railroad.

Imitating Marble by Slate.

Slate ie rapidly taking place of marble for interior decoration. For ornsmental purposee, after heing properly cut and trimmed, it is scoured with pumice-stone, then rubbed with powdered pumice-stone, and polished with felt. It is now ready to he transformed into marble. The elabs having been prepared, and painted with the groundwork color, they are ready to dip. A wat is at hand, containing water mixed with ox gall, on which the colors are floated, and which ie in part prepared in the eame way ae for making marbled paper, or marbling the edges of hooke. A workman dips a small bruch in the colore and eprinkles it on the surface; then he fans the water with a palm-leaf, and draws the hrush through it several times. The mixed paint spreads on the surface of the water, like the veining in marble, and then the slah is let down till it touches the surface of the liquid, when the marbled colors floating on it will adhere to the slab of slate, when it is put to dry. A mere change of groundwork and colors gives the verieties of marble, Egyptian, Spanish, Galway, Pyronese, etc. The most elaborate work, as for altar pieces, chesshoards, and horder, is done by hand. After the application of colors, succeesive bakinge and polishinge finish the work. Thie marhleized slate is quite elegant, posseesing sixteen timee the strength of marble, and scarcely distinguishable from it. The imitation of marble in slate is employed for coffins, caskets, tahletops, mantels, hilliard-beds, lamp-stands, and innumerahle domestic and ornamental uees.

ORE SHIPMENT.—At present the ore shipped by rail irom the Comstock mines to the various mills amounts to 90 car-loads per day.

DEWEY & CO.

American & Foreign Patent Agents,

OFFICE, 224 SANSOME STREET, S. F.

PATENTS obtained promptly; Caveats filed expeditiously; Patent reissues taken out; Assignments made and recorded in legal form; Copies of Patents and Assignments procured; Examinations of Patents made here and at Washington; Examinations made of Assignments recorded in Washington; Examinations ordered and reported by Telegraph; Rejected cases taken up and Patents obtained; Interferences Prosecuted; Opinions rendered regarding the validity of Patents and Assignments; every legitimate branch of Patent Agency Business promptly and thoroughly conducted.

Our intimate knowledge of the various inventions of this coast, and long practice in patent business, enable us to abundantly satisfy our patrons; and our success and business are constantly increasing.

The shrewdest and most experienced Inventors are found among our most steadfast friends and patrons, who fully appreciate our advantages in bringing valuable inventions to the notice of the public through the columns of our widely circulated, first-class journals—thereby facilitating their introduction, sale and popularity.

Foreign Patents.

In addition to American Patents, we secures with the assistance of co-operative agents, claims in all foreign countries which grant Patents, including Great Britain, France; Belgium, Prussia, Austria, Victoria, Peru, Russia, Spain, British India, Saxony, British Columbia, Canada, Norway, Sweden, Mexico, Victoria, Brazil, Bavaria, Holland, Denmark, Italy, Portugal, Cuba, Roman States, Wurtemberg, New Zealand, New South Wales, Queensland, Tasmania, Brazil, New Grenada, Chile, Argentine Republic, AND EVERY COUNTRY IN THE WORLD where Patents are obtainable.

No models are required in European countries, but the drawings and specifications should be prepared with thoroughness, by able persons who are familiar with the requirements and changes of foreign patent laws—agents who are reliable and permanently established.

Our schedule prices for obtaining foreign patents, in all cases, will always be as low, and in some instances lower, than those of any other responsible agency.

We *can and do* get foreign patents for inventors in the Pacific States from two to six months (according to the location of the country SOONER than any other agents.

Home Counsel.

Our long experience in obtaining patents for Inventors on this Coast has familiarized us with the character of most of the inventions already patented; hence we are frequently able to save our patrons the cost of a fruitless application by pointing them to the same thing already covered by a patent. We are always free to advise applicants of any knowledge we have of previous applications which will interfere with their obtaining a patent.

We invite the acquaintance of all parties connected with inventions and patent right business, believing that the mutual conference of legitimate business and professional men is mutual gain. Parties in doubt in regard to their rights as assignees of patents, or purchasers of patented articles, can often receive advice of importance to them from a short call at our office.

Remittances of money, made by individual inventors to the Government, sometimes miscarry, and it has repeatedly happened that applicants have not only lost their money, but their inventions also, from this cause and consequent delay. We hold ourselves responsible for all fees entrusted to our agency.

The principal portion of the patent business of this coast has been done, and is still being done, through our agency. We are familiar with, and have full records, of all former cases, and can more directly judge of the value and patentability of inventions discovered here than any other agents.

Situated so remote from the seat of government, delays are even more dangerous to the inventors of the Pacific Coast than to applicants in the Eastern States. Valuable patents may be lost by the extra time consumed in transmitting specifications from Eastern agencies back to this coast for the signature of the inventor.

Confidential.

We take great pains to preserve secrecy in all confidential matters, and applicants for patents can rest assured that their communications and business transactions will be held strictly confidential by us. Circulars free.

Engravings.

We have superior artists in our own office, and all facilities for producing fine and satisfactory illustrations of inventions and machinery, for newspaper, book, circular and other printed illustrations, and are always ready to assist patrons in bringing their valuable discoveries into practical and profitable use.

ARE YOU GOING TO PAINT?

THEN USE THE BEST.

THE AVERILL CHEMICAL PAINT

WILL LAST THREE TIMES AS LONG as the best lead and oil, without CHALKING; is of any desired color. It is prepared for immediate application, requiring no Oil, Thinner or Drier, and does not spoil by standing any length of time. It is equally as good for inside as outside work; over old work as well as new; in fact, where any paint can be used the AVERILL CHEMICAL PAINT will be found superior to any other. Any one can apply it who can use a brush, which truly makes it the FARMER'S FRIEND.

IT IS JUST THE PAINT FOR THE AGE.

IT IS SOLD BY THE GALLON ONLY.

One gallon covers 20 square yards 2 coats.

For further information send for sample card and price list.

Ayer's Sarsaparilla,

FOR PURIFYING THE BLOOD.

This compound of the vegetable alteratives, Sarsaparilla, Dock, Stillingia and Mandrake with the Iodides of Potassium and Iron makes a most effectual cure of a series of complaints which are very prevalent and afflicting. It purifies the blood, purges out the lurking humors in the system, that undermine health and settle into troublesome disorders. Eruptions of the skin are the appearance on the surface of humors that should be expelled from the blood. Internal derangements are the determination of these same humors to some internal organ, or organs, whose action they derange, and whose substance they disease and destroy. AYER'S SARSAPARILLA expels these humors from the blood. When they are gone, the disorders they produce disappear, such as Ulcerations of the Liver, Stomach, Kidneys, Lungs, Eruptions and Eruptive Diseases of the Skin, St. Anthony's Fire, Rose or Erysipelas, Pimples, Pustules, Blotches, Boils, Tumors, Tetter and Salt Rheum, Scald Head, Ringworm, Ulcers and Sores, Rheumatism, Neuralgia, Pain in the Bones, Side and Head, Female Weakness, Sterility, Leucorrhœa arising from internal ulceration and uterine disease, Dropsy, Dyspepsia, Emaciation and General Debility. With their departure health returns.

San Francisco Cordage Company.

Established 1856.

We have just added a large amount of new machinery of the latest and most improved kind, and are again prepared to fill orders for Rope of any special lengths and sizes. Constantly on hand a large stock of Manila Rope, all sizes; Tarred Manila Rope; Hay Rope; Whale Line, etc., etc.

TUBBS & CO.,
de20 611 and 613 Front street, San Francisco.

Aleut Mummies.

At the last meeting of the Californis Academy of Sciences, Dr. W. H. Dall, of the U.S. Coast Survey, who has recently returned from the Cosst of Alsska, gave the following account of Alent mnmmies fonud on the Island of Four Mountains.

"I have previously given the Acsdemy some account of the Alsutian method of mummifying their more distinguished dead. Many tales are onrrent among the Aleuts in regard to particnlar cases of this practice, and among others one has been freqnently related to ms in regard to some mnmmies preserved in a cave on one of the volcanic islands known as the "Four Oraters," or "Four Mountains." When iu the vicinity in 1873 we were unable to land and test the trnth of this history on account of bad weather and the absence of any harbors. More recently, however, this hae been succeeefully done. The Alsska Commercial company has a standing nrder to its agents to collect and preserve objects of interest in ethnology and natnral hietory, and the cabinet of the scsdemy bears witness to the generosity of the company and the value of some of the material thns acquired. Captain E. Hennig, of the compsny's aervice, with the company's schooner "Wm. Sutton," being employed in removing some hunters from the island of the Four Mountains, he was enahled, after seven unsnccessiul attempts, to land at the base of the cliff where the fallen rocks form a kind of cave, and was directed by the natives to the exact spot. Here he obtained 12 mummies, in good condition, heside several ekulls of thoee which. being laid near the entrsnce of the cave, hsd become injnred by the weather. There were sleo a moderate number of carvings and implements found, though some natives, less auperstitious than the rest, had appropriated a qsntity of weapona (reported to have once been there) for nee in hnnting. The island heiog volcanic snd, in fact, still active, the soil is still warm and the atmosphere of the cave was quite hot, which accounts for the extremely good preeervation of the remsins. Most of the bodies were simply eviscerated, stuffed with grass, dried, wrapped in fura and grasa matting and then secured in a water-proof covering of seal-hide. Two or three had mnch more pains bestowed upou them. and were of course of mnch more interest. The story of their deposition is too long to he given here, and is not particularly interesting, hut it includes the fate of an old chief of the Island of the Four Mountaine and his family, all of whom were hnried in the cave. Among the others were a female, who died when with child from a prematnre birth, brought on by an accident, and the esential correctness of the tradition is attested by the presence of a little mummy of the still-born infant. The date of the first interment is very well fixed by the fnct that the old chief died the autnmn before the spring in which the Russians made their first appearance at the Four Monntains; and, consequently, none of the bodies are mnch over 100 years old. Hence they should not be confounded with the aucient pre-historic remains which I have formerly described in the acadeiny's prnceedings.

"The mummies of real interest were few in number. The most conapicuous was that of the old chief. I am informed that thie body wae enveloped in fors, dressed in the usual native attire, and furuished with a sort of wooden armor, formerly worn by the Aleuts. The whole wae placed in a aort of basket, in a sitting poetnre, and carefully covered with water-proof skins, secured by line made of einew, either hraided or made into what aailors call "square eennit." Thie line, together with a net made nf sinew in which another of the bodiee wae secured, were very finely made, and nearly as perfect and strong as when first placed there. The matting, made of prepared grass, wae exceedingly fine, in most cases far superior in finish and delicacy to any now made in the islands. One of the smaller mummies, in a triangular-shaped hundle or basket, had a pattern ot a maltese croea worked into a stripe of another color; thie was quite fresh, aud the grass atill retained its red and yellow tinge. The largest basket hae a wooden arraugement fastened with hone hnttons, forming a hroad hoop, which served it for a base. Moat of the more carefully-preserved specimens had heen once suspeuded in the air hy haudlea or oorde attached to their envelopes.

The other artiolee found in the oave were stone-knives, and other implements, and a few oarvinge, one of which wae supposed hy the finder to he an idol, but tbie ia probahly an error. A child's boot of native make was found in the cave, with the fur perfectly preeerved, and in it wae a little ivory image of a sea-otter. A numher of other bone and ivory toys or trinkete were also found. These artiolee are expected here nn the hark "Cyane," in a few weeke, when those interested in these matters will probahly have an opportunity of making a oareful examination of them.

THE Silver Lake mining company have at last constructed a wagon road from Careon to their ore dumps. It is expected that next year the company will erect furnaces of their own and amelt their oree at home, instead of sending them to California.

MINERE in Weaver Basin are putting in spare time cutting bed-rock. Nice Amusement!

The Apple-worm in California.

Ons of ths peculiar pleasuree connected with the eating of Californis fruit is the confidence that the posession of each well developed globe hss not been pre-empted by a disgusting worm. Our apples especially have been acknowledged to be free from this pest; though predictione have continually been made that our time would surely come. Accordiug to reliable reporte these predictions are now bsing fulfilled.

Unfavorable but indefinite accounts iu this connection have been afloat during the lsst year or two; hnt we derivs the most convincing evidence of this fact from statements made at the San Joaquin Valley fair, by D. A. Lesrned of Stockton. Applee were exhibited at the Pavilion hy Mr. Learned, showing the operations of these frnit maggots. In the opinion of the exhibiter, who had observed their habits closely, they are the same as the insect whioh ie so destructive to the apple crop of the East. He is of the opinion thst they have heen brought ncrose the continent to California in Eastern apples. This ie possible; hut it seems to ue more probable that they were brought here in the clothes, baggage nr "traps" of immigrants. Thie however is a matter of conjecture and of minor importance; the fact that they are here is whst conoerns us most and this fact seeme indiapntable.

But we are not seriously alarmed at the present ontlook for our frnit. In the first place we do not believe that the climate of California is favorable to the existence of insects of this clase. If it were congeuial to them they would probnbly have been more numerous at the preaent time. In other conntries. they have seemed to be "the accompanying evil" to the apple. We have been in other new frnit-growing countries—none of them, it is true, heing quite so isolated as California—and have never known the apple-worm to be a tardy visitor at the feaet. This is not among thoee pests that make periodic excursione in a country, snoh as the locust, weavil, chiuch-hug, grasshopper, etc. It is a permanent settler, like the ant, the house-fly, the mosquito, etc. never failing to make their appearance, though more plentiful iu eome eeasons than iu others.

Our escape thus far from this pest ie, in our opioion, not attributable to our isolation, or to a lack of enterprise on the part of the insect; hut to the peculiarities of our climate. And may we not reasonably expect that a canse which hns been sufficiently potent to keep these insects out of the country up to the present time, will exterminate them after they have etrayed to these ungenial regions. The apple-worm ie only at home in a hnmid atmoaphere, and where the nights are sultry.

And even though thie ahonld become n permanent evil in nnr orcharde, we would not be justified in making a very eerioue matter of it Our Eastern friends do not aink under it, aod why should we? They enjoy their apples perhaps even more heartily than we do oure. The additional care in aesorting, which the supposed presence of the apple-worm necessitatee, is really an advantage in defining the grades nf apples. The presence of this destroyer ia also an effectual check to over production, as the fruit most affected will fall to the grounnd during the early stages of its growth. If the owners of fruit trees would attend properly to the thinning procesa—a duty which they owe to their treee and to themselves also, in reality—then we might diepenee with the labora of the apple-worm; but this they will not do; consequently the over-bnrdened treee are only relieved by these insects or by the visitatione nf frosts and hlighting winds. But in countries like California, where theae agente do not exiat, and where nearly every blossom ia liahle to matnre, a premature death may be expected for our fruit trees.

Now brother fruit growers and frnit eaters of California, don't allow yourselves to be "worked np" in regard to the appearance of the apple-moth. Do not be over-sensitive ahout this thing getting noised abroad, and the reputation of California apples snffering therehy. Probably the contrast between California and Eastern fruit, in regard to cleanliness, haa been somewhat overdrawn; and it is extremely donbtful whether the characteristic of California frnit which has given ns so much satisfaction—posoibly to the neglect of some more esaential points—would really enhance its value iu markete outside of the State.

WHITE SULPHER SPRINGS, ELKO, Co., NEV.—These Springs are becomiug ntilized for various purposee other than medicinal. Hot honsee are kept conatantly at a forcing temperature, and plants and vegetables are alwaya looking green and freeh. Chickens are hatched iu great nnmhers in a eort of hot honse, the necessary heat heing furnished hy the pipes which convey the hot water from the springs to the hathing house. The bathiug facilitiee have been improved of late. A large awimming pond has been constructed, 20 feet wide by 43 feet long, and 5 feet in depth. In this a person can ewim to his heart's content. A convenient bathing honse hae also been erected with roome suitably fnrnished. These wonderful springa sre faet hecoming a favorite resort for invalids and pleasnre seekers, and the proprietor, Mr. Van Allstine, ie highly spoken of hy nur friends and correepondents. The aprings are situated adjacent to Elkn and a four horse coach is daily in attendance to convey passengers back and forth.

General News.

VON ARNIM'S CASE is becoming intelligible. It appears that Bismarck became indignant at the Count for preferring an nltrsmontane monarchy in Francs to a comparatively liberal and pacific republic, and determined to remove him. Not wishiug, however, to offend him, Connt Biemarck wrote him a ceneorions letter, which he expeoted would induce the Connt to resigu. Von Arnim refnsing, hs was finally absolutely dismissed, and took with him Bismsrck's letters, now represented to be so fearfully offensive. For this act he wae arrested and olosely imprisoned; bnt the latest advioee represent pnblio sympathy so largely in his favor that he is now kept nnder less reetraiut. The very lateat report is to the effect that Bismarck threstens to leave the csbinet, nnless his action against the Connt is more fully endorsed.

YOSEMITE STILL OPEN.—The hotels in Yosemite valley are to be kept open, and the etages are to run every other day hy the Meroed cañon ronte all winter, if the patronage should he sufficient to psy. The roade were in excellent condition hefore the storm, and no snow had appeared yet at Gentry's, whose house is 2,000 feet above the highest point on the cañon road. The stages have lately averaged ahont five passengers to a trip. The atmosphere is nsually clearer in winter than in summer, and the scenery in the monntains ie very plessant after the firet rains.

TERRIBLE TRAGENY.—Awful and speedy vengeance was taken by an outraged husband on the alleged seducer of his wife nesr Calistoga on saturday night last. Edward J. Muybridge ehot through the heart Major Harry Larkyns, who had been criminally intimate witb his wife. Larkyns was au old newspaper man and eqnally as well known as the avenger who is one of the ablest and most successful photographers in the State. He was an employee of Bradley & Rulofson. The *liason* was divulged through letters entrueted by the guilty pair to a nurse in the family of Mrs. Muybridge. The huahand ie iu custody.

BRITISH PATENT SPECIFICATIONS.—Governor Booth is spprised by letters from the Department nf State at Washington that the Mechanica' Institnte at San Francieco has been given a complete set of the drawings nnd epecificatione of the British Patent Office. The volumee are very rare. The complete set at the present time consiste of more than 3,000 volumee, and includes upwards of 84,000 specifications of patente. The donation inoludes publieations to be made hereafter, and as they increase at the rate of about 150 aunually, their value ie necessarily great.

MORE POLAR EXPEDITIONS.—It is now definitely known that the Austrian government will eend two more expeditions to the far north. The first will follow in the footstepe of the one just retnrned, and will he conducted and fitted out by the well-known explorer, Count Wilezek. Among ite members will be D. Kepea, one of thoae engaged in the recent expedition. The eecond is to have Lieut. Payer for its ohief, and will proceed north via Greenland.

ARTESIAN WELL.—On the 2d inst., saya the *Semi-Tropical Press*, 2,000 feet of piping for the artesian well of the O. P. R. R. company, at West Oakland, was shipped from Philadelphia. It ie expected to arrive here iu about 15 daye. Upon ite being received here, the present well now sunk to a depth of 400 feet, will be put down 1,000 feet, or a few more.

BRANCH STATE PRISON.—From forty to fifty men are at present employed on the new branch prison, at Foleom. and ao soon as the preliminary work ie sufficieutly advanced, there will be a demand for abont a hundred more builders. The work will be puehed till the appropriation is exhansted.

THE THIRD TERM QUESTION.—A Waehington special saya: "There is the very best authority for the etatement that the President has grown weary of the third term talk, and has intimated his purpose to pnhlioly define hie position on that euhject at an early day. He will dieclaim all hope or ambition for re-election.

COLUMN VENDOME NEARLY REBUILT.—It is officially announced that the rebuilding of the Colnmu Vendome will be completed next month, and that the statne of Napoleon, which ie nearly finished, will be placed on the monument.

THE RAINY SEASON.—There ia a promise of an unnsually early and ahundantly rainy season. The cold, gray eky and frequent showers are unmistakahle in their character. In fact the rainy aeason hae already been fairly inangurated.

NEWSPAPER CORRESPONDENT KILLED.—Mr. Bnokland, correepondent of the New York *Times*, was recently aesaasinated when on his way to the Carlist headquartere. Oue account saye he was shot hy special order of the Republicans.

IMPORTANT FAILURE.—The suspension of the house of E. E. Morgan'e Sons of this city, nn Monday last, hae heen the talk of the week in financial ciroles. The full particulare of the failure have not yet heen made public.

THE thirty-three Chinese students that arrived by the Japan, a few days ago, are en route for Springfield, Mass.

THERE are now over four miles of drives in the Golden Gate Park, and some 300 acres under cultivation.

YELLOW JACKETS.—Every country hss its plagnes. Ancient Eygpt hsd its locuste; our Western territories have their grase hoppers; and it eeems to hs reserved for California, or at least this part of it, to have its plsgue or pest—the yellow jackets. They seem to he rapidly inoressing in nnmbers year by year, and their ravsges especially among the grapes, are becoming slarmiugly destructive. They eat tona of the fruit on the vines, and in some inatanoee make nearly a clean sweep nf that part of the crop spread ont to he dried for raieins. A friend suggests that about the best way to abate the nnisance, would he for the Stste to offer a preminm with a view to encoursging the destrnotion of their nests. The nests he thiuks conld be fonnd quite resdily, by watching the littls msranders when lsden with their pellets, as they theu fly in a "bee hne" straight to them. This suggestion looks plausible, hnt to be effective the plsn would have to be gensrslly adopted and perseveringly carried out. —*Folsom Telegraph.*

THIEVERY EVERYWHERE.—It would seem ss if the very air snrrondiug official position wss pregnant with evil inflnences. Men who for yeare wsre regarded by their neighbors as honest and honorable give wsy to temptation to peculate npon ths public funds when entrusted to their keeping, and to oommitt downright robbery in office. The revelations of this eort nf corruption are oft recurring and fearful. The investigations now going on in this oity are perfectly frightful to an uninitiated person. Thievery seems to be becoming quite an sristocratic profeesion. Doctors, lawyers, merchants and clerks, all take prominent position in the trade, and lay violent hsnds on whstever they can.

INDIAN MASSACRE.—A Yankton, Dakota, dispatch says: "A party of seven, who left there teo days ago for the Black Hills, were attacked while in camp, at the month of the Little Platte river, by a party of Sioux, who killed two and wounded three of the party, but were finally repulsed with ten killed and wounded. The party returned to Yankton.

JOSEPH BOSTON of Santa Cruz has suicided hy poison. He was a very good man, and a prominent member of the Episcopal church. As in Eckfeldt's case an overtaxed brain led him to the commission of the fatal act.

MARRIED IN MID AIR.—A marriage iu mid air, in Donaldson's balloon, took place at Cincinnati on Monday last, in the presence of 50,000 people. The marriage party conoisted of seven.

CAPT. BLACKMAN, lighthouse keeper at Punta Arena, Mendocino Co., fell dead on the 15th. He was an Englishman fifty two years old, and a very efficient officer and obliging gentleman.

WANT MILITARY RULE.—A Wsehiugton special says the conservativee of Sonth Carolina are circnlating a petition eolioiting the Federal government to resume military control of the State.

MR TERRY, teacher in the public school at Ukiah, accidentally ehot himeelf while taking a shotgun from behind a table, on the 19th. He was lately from Michigan.

A FIRE IN MONTREAL, a few days since, destroyed J. McArthur & Son'a building and badly damaged DeBrete Bros. & McGill'e building. Loes, $250,000.

HUNG.—Willis McLean, the murderer, was hung at Enterprise, Miss., on Saturday last. The execution waa public, aud witnessed by about 1,000 persons.

BENGAL has been visited by a frightful oyclone, whioh caused a general havoc. The telegraph linee were prostrated, and csrs blown from the track.

THE OGDEN HOUSE, at Council Bluffs, Iowa, was burned a few days since. Loss, $80,000; insured for $35,000.

A GALE on the coast nf the north of England, Tuesday night, caused serions loss of life and property.

PATENTS & INVENTIONS.

A Weekly List of U. S. Patents Issued to Pacific Coast Inventors.

[FROM OFFICIAL REPORTS FOR THE MINING AND SCIENTIFIC PRESS, DEWEY & CO., PUBLISHERS AND U. S. AND FOREIGN PATENT AGENTS.]

By Special Dispatch, Dated Washingtnn, D. C., Oct. 20th, 1874.

FOR WEEK ENDING OCT. 6th, 1874.*

BILLIARD CUSHION.—Richard Kind, S. F., Cal.

QUARTZ MILL FEEDER.—Thomae J. Wood, Sonora, Cal.

BILLIARD TABLE LEVELER.—Geo. C. Brotherton, San Quentin, Cal.

VEHICLE SPRING.—Milton Newell, S. F., Cal.

MACHINE FOR TRANAMITTING POWER.—Albert Reed, Oroville, Cal.

GRAIN SEPARATOR.—Nathan M. Brown, Pescadero, Cal.

TRANSPLANTER.—Timothy Carroll, Anaheim Cal.

———*The patents are not reedy for delivery by the Petent Office until some 14 deye after the date of issue.

NOTE.—Copiee of U. S. and Foreign Petents furnished by DEWEY & Co., in the shortest time poseible (by telegreph or otherwise) et the lowest rates. All patent business for Pacific coast inventors transacted with perfect security and in the shortest time possible.

[Continued from Page 261.]

second etation levels are both looking well and yieldiag the neaal amount of good milliag ore.

Arizona

MINING ITEMS.—*Miner*, Oct. 9: Mr. Bellou came in this morniag from Lyax and Haesayampa creeke, and informed us that all of the arrastrae at the General Crook miae are runniag.

On Lynx creek, placer miaere are throwing up gravel, eo as to haes it ready for washiag whenever water comes.

MINING OPERATIONS.—*Arizona Citizen*, Oct. 10: E. M. Pearce has jaet received retarne of 12¼ tons of copper ore ehipped by himself, Tully, Ochea & Co., and others of their company, to San Francisco for redaction. Thoore was from the Mammoth mine in the vicinity of the Youag America, in Silver mountain district, and ths net retarn, after paying all sorts of ohargee, reaeonable and unreaeoneble, ie over $700; excluding the cost of shipment from the mins to Yuma, the return is $986.20.

Several items in the expense account will not he incurred again, as for instaace $61 commieeions efter every other conceivable item hed been put in.

The 25,000 pounds of orê shipped and treated, with this experience bought and paid for, could be now handled at a olear profit of over $900 gold coin. Think of this here and eleewhere! Miniag ore far from all suppliee and convenioaces; then ehipping it 250 miles by wagon; then about 200 by river and oceen with a re-shipmeat from river to ocean veseel; then paying all other charges that are impoeed by the good men in the ciiiee who encouroge mining, aad then get a net return of near $70 per ton! Then know, aleo, that in Silver Mountain district alone this quality of ore ie ae nearly inexhaustible as it ie possible to conceive such a condition of anything. Mr. Pearce and O. O. Brown have jaet returned from this district. On the Young Americe, they have eeveral men miaiag, and 15 at their emeltiag works, about 3½ milee from the mine; and the compeny ie now turning out pure copper, and will eoon ship a train load of the metsl and some ore. The San Francisco men worked so well for their own interests, ia the case meationed, that it ie now determiaed to ehip direot to Baltimore—which may be a hint of value to San Francisco.

Colorado.

BULLION. — Coloredo *News*, Oct. 10: The Stewart silver reduciag company have shipped since last weekly report, 10 silver bars, coin valne $11,170 88.

THE Jodd & Crosby reduction works have shipped 8,428 ozs., coin value, $9,083.35.

CLEAR CREEK COUNTY ITEMS. — The Silver Plume is being worked right along on five levele. Meesre. Carpenter & Johnsoa have taken a leaee on the third level, and now have good ore, while every iadication (never heretofore deceptive) points to the proximity of a hig pooket. All the different levele are in pay.

THE last ore brought down from the Beker mine by Mr. Millepaugh runs—firet class, 408 ozs., and eecond olaee, 235 ozs. silver per ton.

THE Pelican mill is expected to be ready to reeame operatione in ten or twelve daye. It hae heen enlarged by the addition of three Bruckner furnaces, making five in all, and hes been thoroughly overhauled, enlerged and improved in every respect. When it commences operations, the prodaction of hullion in Georgetown will be greatly increased.

THE Ocean Wave tunnel is now in 760 ft, and ie progreeeing at the rate of 100 ft. per month, being run night and day by eight hour shifts.

Idaho.

RICH.—*Statesman*, Oct. 15: Capt. Bledsoe informe ue that they are doing a lively business at South Mountain district, Owyhee county. In a twenty-five houre' run of one furnace from sixty tone of hullion, they got one hundred bars of metal, abont 1,200 pounds, and in value about $2,400. All the flux neceeary for smelting is found in the district. There being but one furnace there, several teame are hauling bullion to the Winnemucca smelting works.

Utah.

LITTLE COTTONWOOD.—From a correspondent of the *Tribune*, writing from Little Cottonwood, we learn that the mines are generally looking better than they have ever done, and are prodacing plenty of ore. The Daveaport ie takiag out good ore. The Wellington hae been leased and will make its first shipment of ore thie week. The Fuller is shipping conoiderable ore. The Enterpriee is developing finely. The Hawkeye tunnel ie in 75 feet in a eolid maes of ore. The Phœnix tunnel is in 700 feet with encouraging indications. There ie talk of organizing a new district.

PEALEY MINES.—A correepondent of the *Tribune* writes a letier from Park City from which we extract ae follows: The Grizzly ehows an encouraging view of ledge walls. The McHenry mine hee a mountain of good mining ore oa the surface and a tuanel striking the ledge several hundred feet below the surfece, affordiag rich ore. The Flagstaff mine has 24 men at work. They have discountinued work ia the Porcupine for want of faade.

TINTIC DISTRICT.—Cor. *Tribune*, dated Enreka City, Oct. 15: The Eureka hill mines are by no meane all there ie in thie neighborhood, in the way of good miniag property, for there are other valuable loeatione cloee by, but the stoppage of Eureka Hill has diecouraged owners hithorto and preveated their receiviag the attention which they undoubtedly ultimately will.

THREE bars of silver bullion, worth about $2,500 was ehipped last mail per Welle Fargo, from Tintic mills—and Tintic hae been shippiag more bullion for a long time than any other miniag dietrict in Utah,

THE Wyoming mill at Homansville, etarted up again recently to work Eureka and Sunbeam ores.

MR. JOHN LEETHAM ie paehiag on his smelting works near Goehen dam, and expects to soon etart the farnaces. He ie also talking of concentrating worke, and ie pushing his developments on Mineral Hill with satiefactory results.

HAND VS. MACHINE DRILLS.—At the Gold Run tunnel in Kean couaty, while running the tunael by hand thoy had three white men and fifteca Chinamen at work and oaly made three feet in eighteen shifts. With the Barleigh Drill at the other end of the tunnel they made 30 feet ia a week, there being 12 shifts with the drill and 18 ehifts with the men. The drill made 5 feet per day in an 8x8 tunnel and the 18 men oaly made three feet in a week although working three shifts to the drill'e two. Cost—by hand $80 per foot; by machinery $23 per foot. Difference in form of maohinery $57 per foot. This work wae done nader the stone contract.

DEATH OF AN INVENTOR.—The boiler of the Bailey mill and wood eawing eetablishment of E. W. Perrin, at Eureka, blew up on Friday morning. Mr. Perrin was injared to euch an exieat that he died ehortly afterward. Portions of the boiler were hnrled half a mile over the mein portions of the town to the head of Poverty Galch. Three other men who were in the place nerrowly eecaped being killed. Mr. Perrin was about 46 yeers of age, and leaves a wife. He was the inventor of the patent iron-fastened wood pavement, which we illuetrated in thie journal a few months eince, and had several contracts to improve the streets of Eastern cities.

MINING TIMBERS —The Truckee *Republican* eaye: "Some of the leading stookholders of the Bank of California have closed a contract with lumber dealers at Carson, for the delivery of 60,000,000 feet of lumber and mining timbere for the Cometock Lode. The contract extends over a period of five years—12,000,000 to be delivered annually. Tue lumber and timber for this extensive contract is to be obtained from the Lake Tahoe haein.

THE average wages in the Massachusetts factories ie etated as follows: Skilled mechanics employed on wood, and iron workere, $15.27 and $14.30 per week; engineere, $14.30; laborers, $8.75. Factory operatives proper—Dressers, $14; mule-epinnere, $11.75; girders, $9.80; picket-feedere, $8.25; etrippers, $7.70.

TWENTY tons of machinery and eixty thousand feet of lumber arrived here thie week from California, eaye the Winnemucca *Silver State* of Ootober 13th, for a quartz mill in Bull Run dietrict. Twenty-seven tons more of machinery for the same place have since arrived.

A COMPANY, among whom are E. L. Sulliven, Ed. J. Pringle, J. P. Jones, D. D. Colton, Col. Fry, Col. McDowell and J. S. Caesell has been formed to open the rich cinnaber mines seven milee north of Saata Barbara.

WORK etill continues on the new canal of the El Doredo water and mining compaay, with increased force and energy. It ie probable that wherever work caa be done to any advantage, a force will he kept on all through the winter.

THE Sulphur Banks mine, Napa county, ie shipping fifty flaske of quicksilver per week.

A NEW mining region has been discovered twenty miles north of Panama.

THE San Francisco Copper Mine, Nevada county, ie being worked with succese.

THEY are talking abont a 4,000-foot shaft on the Imperial mine on the Cometock.

ENCOURAGING reports are received from the mines eight miles below Riverside.

ANTIMONY regulus ie quoted in Liverpool at £46 and £47 per ton.

FROM AN INVENTOR.

PLACERVILLE, Octo ber 3d, 1874.

MESSRS. DEWEY & CO.—*Gentlemen*: Yestarday I received from you my Letters Patent for my Hydraulic Mining Lamp, and I herewith tender you my grateful acknowledgements for the energy and promptness which you have displayed in working said invention through the Patent Office for me; and shall in the future, as well as the past, recommend all parties having new inventions, to go direct to the office of Dewey & Co., and ask for Mr. Boona, in the Patent Department, and if he cannot procure a patent for them, they will find it useless to try further. Yours Respectfully, O. B. BROWN.

MORTALITY PREVENTED.—It would be a moderate estimate to place the number of cases in which Consumption is prevented by the timely use of *Hale's Honey of Horehound and Tar*, at ten thousand per annum No cough, cold, bronchial affection, sore throat, or other ailment of the organs of respiration, can aver degenerate into a mortal disease, if this palatable, and absolutely infallible specifio be taken in time and long enough persevered in.

Pike's Tooth-Ache Drops—Cure in one minnte.

[PATENTED MAY 26TH, 1874.]

To Superintendents of Quartz Mills and Mining Men Generally.

We guarantee these SHOES and DIES to do the work of four sets of iron and to be at least 10 per cent. cheaper. They are gradually coming into use in all of the principal mills on this coast.

Their advantages over iron are cheapness on first cost, increased crushing capacity, time saved in changing and in setting tappets, increased value of amalgam by absence of iron dust and chippings, and a saving of 75 per cent. in freight. They possess a similar superiority that steel rails do over iron rails. It takes 40 days to fill orders from the manufactory East. Price 20 cents per pound shipped at San Francisco. Terms liberal.

Address all orders, with dimensions, to

CAST STEEL SHOE & DIE CO.,
Room 1, Academy Building, San Francisco.

THE

AMERICAN TURBINE WATER WHEEL

Recently improved and submitted to thorough scientific tests by James Emerson, showing the following useful effect of the power of the water utilized, being

THE HIGHEST RESULTS EVER KNOWN.

Percentage of part gate, ¼ 60.08; ½ 69.64; ¾ 78.73; ¾ 82.53; ⅞ 82.90. Percentage of whole gate, 83.14.

Mr. Emmerson says: "These are the best average results ever given by any Turbine Wheel in my experience."

A splendidly illustrated descriptive catalogue, or any further information desired, furnished on application to

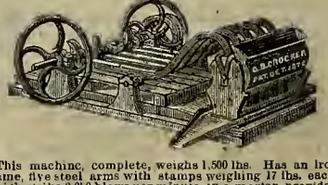
CROCKER'S PATENT

TRIP HAMMER QUARTZ BATTERY.



This machine, complete, weighs 1,500 lbs. Has an iron frame, five steel arms with stamps weighing 17 lbs. each, which strike 200 blows per minute, in a mortar provided with screens on both sides, and crushes FINE 600 lbs. per hour, requiring one-horse power to drive it. Has been thoroughly tested, and is guaranteed to give good satisfaction. PRICE, $600.

G. D. CROCKER,
17v26-tf 315 California street, San Francisco.

BALL'S SWEEPING DREDGE,

A NEW AND VALUABLE

CALIFORNIA INVENTION,

Has been very lately well proven by performing a job of dredging at the mouth of San Antonio Creek, at Oakland, Cal.

There is hut this one machine that has aver had these improvemants employed. It is an old machine, formerly huilt for another device, and is unfavorahly constructed for Ball's improvements; yat this first temporary experimental machine has filled a scow of eighty-fiva cubic yards in sixteen minutes in unfavorable digging. For durability, digging hard material and fast work, it has a reputation (supported by leading engineers) as having no equal.

Testimonials and references will be given on application to the inventor, who is the sole owner of patents (excepting having made an assignment of the one machine now belonging to the Central Pacific Railroad Company). Having resolved not to sell any rights nniess upon a *basis* of actual work performed by a machine built hy myself for the purpose of fairly establishing the worth of the invention, I therefore offer to sell machines or rights on the following plan, which is warranting the capacity of the machine by actual work:

I will enter into an agreement with any responaible party to build and sell a machine, scows and tender, all complete, and right of all my improvements in dredging machines throughout the Pacific Coast for $20,000, warranting the machine to dredge six cnbic yards per minute (to fill a scow at that rate). $20,000 will hut littlo more than pay the cost of building the machine, scows, etc., all complete; therefore I am proposing to ask *nothing* for my patente nnless my machine dredges more than six cnbic yards per minute. But it shall be frnrther agreed that in case (at a fair trial to be made within a stated time) the machine shall fill a scow at the rate of more than six cubic yards per minute, then $10,000 shall be added to the price above stated for each and every snch additional cubic yard thns dredged par minute, and for addltional fractions of a cubic yard thns dredged in the same ratio the $10,000 is to be added to said price above stated.

I will sell any otherTerritorial or State rights (either United States or Foreign) npon the samo plan and at a lower price proportionately than the rights for the Pacific Coast.

I will sell a singlo machine with scows and all complete, and right to use tha same in a limited territory, for $ 40,000 on the same plan as above stated, hut will add only $2,000 to each additional yard over the six cnbic yards per minute. Each machine is not to employ more than two 10x20 inch engines.

Paymente to be made in U. S. gold coin on delivery of machine, as may be indicated by agreement.

Address, JOHN A. BALL,
9v28-tf Oakland.

TO MILLMEN AND MINERS.

ASSIGNEES' SALE IN BANKRUPTCY.

NOTICE IS HEREBY GIVEN THAT THE UNDERsigned, under and by virtue of the power and authority vested in them, and by virtue of an order of the District Court of the United States for the District of California, made and entered on the 16th day of September, A. D. 1874, in the matter of the MENDHA SILVER MINING COMPANY, Bankrupt, will sell at public auction, in the city and county of San Francisco, at the auction salesroom of John Middleton & Son, No. 310 Montgomery street, on

Friday, the 23d day of October, A. D. 1874

At 12 o'clock, M.,

All that certain mining and mill property and premises situate in Highland Mining District, near Pioche, State of Nevada, described as follows, to-wit:

One twenty-stamp mill and machinery, together with the appurtenances belonging to the same and necessary for the proper working thereof;

Also, the mill site and the spring known as Mendha Spring, and the tract of land snrrounding the same to the extent of twenty (20) acres;

Also, all the water-pipe connecting the springs with said mill;

Also, the huildings, office, atable, boarding-house, etc., upon said land and adjacent to said mill;

Also, the "Stetefeldt" furnace in said mill;

Also, the following named mines, to-wit:

Mendha Mine;
Mendha West Extension Mine;
Regent Mine;
Arizona No. 2 Mine;
Ohief Mine;
Orown Prince Mine;
Sadowa Mine;
Alaska Mine, and
Mendha East Extension Mine;

Also, the hoisting works, machinery and all other appurtenances connected with said mines, mill and premises.

Said property is known as the Mendha Mill and Mines.

Terms of Sale—Cash in U. S. gold coin; ten per cent. on fall of hammer, halance on confirmation by U. S. District Oourt.

For particulars respecting this property apply to the undersigned, at their respective places of husiness, and to J. M. SEIBERT, Agent of Wells, Fargo & Co., at Pioche, Nevada

Varney's Patent Amalgamator.

These Machines Stand Unrivaled.

For rapidity pulverizing and amalgamating ores, they have no eqnal. No effort has been, or will be spared to have them constructed in the most perfect manner and of the great nnmber now in operation, not one has ever required repairs. The oonstant and increasing demand for them is sufficient evidence of their merits.

They are constructed so as to apply steam directly into the pnlp, or with steam bottoms, as desired.

This Amalgamator Opsrates as Follows:

The pan being filled, the motion of the muller forces the pulp to the center, whore it is drawn down through the apparture and between the grinding surfaces.—Thence it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, and to the circumference as before. Thus it is constantly passing a regular flow between the grinding surfaces and into the quicksilver, until the ors is reduced to an impalpable powder, and the metal amalgamated.

Setlers made on the same principle excel all others They hring the pulp so constantly and perfectly in contact with quicksilver, that the particles are rapidly and completely absorbed.

Mill-men are invited to examine these pans and setlers for themselves, at the office, 229 Fremont Street, San Francisco

MILLS FURNISHED AT SHORT NOTICE
At the lowest Market Prices.

Cazin's Combination Ore-Sizer and Concentrator—One Plunger System.
[Covered by Letters Patent of July 2d, 1872, and recent applications.]
Containing a sizing apparatus, (revolving screen) delivering two or four sizes of ore to two or four rows of sieves, each row independent of the other, and each having 5 sieves, each row concentrating according to specific gravity the special size automatically fed unto it, resulting in the simultaneous continual delivery of separated materials, working 2d and 3d-class ores into 1st-class ores of perfect cleanness. It thoroughly separates native gold or copper from quartz or any other lode matter;—galena and silver sulphurets from pyrites, haryta and quartz; and pyrites from quartz.
Added to a battery of stamps these machines constitute a full system of ore concentration, sufficient in most cases for the requirements of western mines, with a capacity of 15 or 20 tons per 24 hours.
For particulars apply to,
F. CAZIN, M. & C. E.
Supt. Denver Concentration and Smelting Co.,
At Denver, Colorado, Look-Box 2225, or corner of Blake and 32d Streets. sg8-16p

VOLUME XXIX Number 18.

Teats' Furnace for Roasting Ores.

This revolving furnace, which we illustrate today, is intended for the roasting, desulphurizing, chloridizing and oxydizing of gold, silver, or other ores. It is built of light boiler iron, conical shaped ends, with cast iron hollow throats, lined with common brick, laid flatwise. The furnace revolves on four adjustable wheels, as shown in the engraving, and is driven through a gear wheel secured in sections to the periphery of the furnace in such a way as to permit of its being removed and replaced without disturbing the brick lining. The driving pinion is on a counter shaft, on the other end of which are change gears worked by a clutch moving on a feather; by this means the speed of the furnace can be changed from fast to slow, or it can be stopped by simply moving the handle of the clutch. At the front end of the furnace is a fire box, 4 ft. long and 3 ft. wide, built of light iron, lined with brick and arched with fire brick. It is so constructed that it can be removed from the ash pit without disturbing its lining.

At the back or rear end of the furnace are the dust chambers, shown in Fig. 3. These are built on pillars in series or stories. The dust is easily and quickly scraped down from one chamber to the other, and finally into the furnace, by means of a hoe.

The interior of the furnace is provided with a sifting conveyor, (shown in Fig. 6,) placed lengthwise with the furnace, and composed of hollow cast iron pipes and movable slotted plates fitted into the pipes in grooves. Each end of the furnace is provided with angle pieces, (shown in Fig. 4,) which, in connection with its conical shaped ends, assist in throwing the ore being roasted on to the conveyor, which moves it from end to end, thoroughly mixing and at the same time sifting it through the heated air. The conveyor, which forms the axis of the furnace, offers but slight obstruction to the free passage of the air currents.

The furnace is charged through one or two doors, from a hopper resting on a beam scale for convenience in weighing. The ore is carried from the stamps to the hopper by means of a screw conveyor. Between the fire box and the conical end of the furnace the throat is provided with a series of holes covered by a sliding ring. By a movement of this, the holes are opened, and such an additional amount of air is introduced as may be desired. Where the rear throat joins the flue to the dust chambers there is a hinged ring of cast iron, which, being opened, allows the removal of the furnace for repairs without displacing the masonry. Immediately above this ring is the revolving damper, which regulates the draft of the furnace. Under the arch in the rear is a door used to introduce salt or other material, and in taking sample tests from the furnace while in motion.

The furnace is heated with coal or wood, light wood being preferred. When hot it is charged and made to revolve slowly, so as to make as little dust as possible till the sulphur commences to burn, after which the speed may be increased to the maximum. After the sulphur is removed, or nearly so, if silver ores are under treatment, salt may be added, in quantity from four or five per cent. for low grade ores upwards. A few revolutions mix the salt thoroughly, after which the furnace should be run very slowly, and occasionally allowed to stand for several minutes till the ore is fully chloridized, which can be ascertained by test samples. A car is then run under the furnace and the charge emptied into it in a few minutes by revolving the furnace rapidly. The furnace is then ready for another charge. The capacity of the furnace illustrated above is about two tons of gold or silver ore, and the charge is treated and the silver chloridized in from three to five hours. Some ores containing a large percentage of zinc, lead or other base metal require as much as eight hours in chloridizing.

One man on each watch attends to the firing, charging and discharging of from five to eight furnaces, and one cord of wood per furnace for every 24 hours is sufficient in chloridizing roasting.

The total weight of iron in each furnace, including hopper, dust-chamber, plates, fire-box, etc., will not vary much from seven tons. It is no more difficult or expensive to set up than ordinary machinery.

It is claimed for this furnace that it is simple, and can be worked with less expense, and that it effects a greater saving of the precious metals, at a less cost, than any other invention in use.

Figure 1 is a perspective view of the furnace, showing it complete and ready to run. Figure 2 is an axial section of furnace, showing the interior arrangements, the manner of holding and introducing plates, etc., and position of angle piece. Figure 3 is a sectional view of the dust chambers, showing different apartments, passage of the draft and the manner of returning the dust to the furnace for reroasting. Figure 4 is a sectional perspective view of the furnace, with the conveyor and angle pieces in place, showing spaces where the ore sifts through. Figure 5 is a cross section of the furnace, showing position of conveyor, and showing that it offers no obstruction to the free passage of the currents of heated air. Figure 6 is a sectional perspective view of the conveying cooler, showing the manner of introducing water, and the passage of the ore in the opposite direction. Figure 7 is a perspective view of the dry kiln, showing the manner of introducing air by and through perforated pipes by a blast, etc.

Messrs. Teats & Breed make also a patent kiln for drying ores by means of an air-blast, and an apparatus for cooling and conveying roasted ore from the furnace, heating water for amalgamation and boilers at the same time.

There have been patents obtained for the above in different foreign countries. Further particulars can be obtained from Messrs. Teats & Breed, care of A. L. Scovill & Co., No. 12 West 8th street, Cincinnati, Ohio.

Our Dried Fruit at the East.

It is extremely gratifying, but not at all surprising under the circumstances, to know that the Eastern market for the dried fruit and vegetables of California is assuming a definite form. When the intrinsic merits of the raw material are considered, with the admirable condition in which it is prepared for the market, securing great economy in handling without any sacrifice of richness, flavor or attractiveness, it is not to be wondered at that this trade should already exhibit a clearly defined basis. There is one important point in this connection which has evidently failed to receive the consideration which it deserves. The satisfaction of having our fruit reach the Eastern consignees in admirable condition is so thorough that the important point has scarcely been realized that it still retains this condition in the hands of dealers, and thus becomes one of the staple articles which the large contractor or the small grocer can safely carry.

Our attention has been called to this subject at present by comments of the New York *Tribune* on the Alden fruit of California. These comments occur in the market reports column of the *Tribune* of Oct. 6th, and are as follows:

This trade promises quite a revolution in the fruit business of this coast, growing out of the general introduction of "Alden's" drying and curing machine. There are now quite a number of large factories in successful operation in different parts of the State. The result of this industry will not be only the supplying of the Pacific slope with dried fruits required, but give large and superior shipments East, and for export not only dried fruits but also canned in good variety, and they compare favorably with the choicest of England's "Oilman's stores." There is considerable inquiry for dried fruits for shipment East and for export, all packed in boxes of 10 and 20 lb.; apples at 25@ lb.; apricots, pears, etc., 30c. do. Dried fruits "Alden's" evaporating process by the attract much attention; the saving is immense, both on freight and in transporting the goods to distant points and is worth careful consideration; to illustrate: One case of "Alden's" onions weighing 58 lb. gross is equal for all culinary purposes to 550 lb. or 5 bags of fresh ones, and 1 case of peas weighing 43 lb equal for family use to 7 cases of canned peas, weighing 350 lb.; the same rule is applied to all fruits and vegetables prepared under this process; boxes of 40 lb. at 16c @ lb., each lb. equal to 7; cherries, etc., 1 lb. at 55c. is equal to 7 lb. of fresh.

The Ophir Mine.

The Gold Hill *News* gives the followiug description of the Ophir mine: Yesterday afternoon, accepting a kind invitation from Superintendent Curtis to visit and examine the mine, in company with some 15 others, mostly mining superintendents, experts and stock speculators, we stepped on one of the cages and glided smoothly and noiselessly down to the 1300-foot station. Proceeding along the main drift, in a westerly course 100 feet, brought us to a turn-table and the main south drift. This drift we followed a distance of 110 feet, which brought us to winze No. 1, where the

First Ore Discoveries

Were made on this level. The winze is an incline, on the sides of which the ore has been breasted out, two sets of timbers in width, to a depth of 85 feet. At that point the ore breasts are still being carried forward, with fine ore in the face and overheard. This body of ore mills $35 per ton and lies 290 feet north of the south line. Again following the main south drift 100 feet, brought us to east cross-cut No. 2, 150 feet from the mouth of which was struck an extremely rich vein of ore, four feet in width. This ore assays from $300 to $700 per ton, and was the first discovery of the

East Development Ore Body,

On this level. An incline winze was first started on the ore vein, but after sinking a few feet, finding themselves in rich ore on all sides, the winze was changed to a perpendicular shaft 12 feet square, which is down 90 feet, the entire distance in ore, the tub samples of which give average assays of from $70 to $300 per ton. This winze is 180 feet from the south line, and is in as fine an ore development as has been made on the Comstock for many a day. Its extent is as yet undetermined in any direction. The west side near the top slanting to the westward, and the east side pitching to the east, gives the whole the appearance of a mighty wedge-shaped body, with the butt end of the wedge downward. From this winze we passed into a southwest drift, which took us to the

Southwest Ore Body,

Developed near the south line in east cross-cut No. 3. This body of ore averages $40 per ton milling test, and its extent north and south is yet undetermined. An incline winze has been sunk directly in the ore, through to the 1465-foot level, and the whole body lies full 100 feet west of the east development winze. We then descended through this winze to the 1465-foot level, stopping frequently on the way to examine the rich ores exhibited on its sides. We reached the 1465-foot level,

Near the South Winze,

Which extends downward to the 1700-foot level, and from the mouth of which a hot sweltering steam was escaping. From this point a drift has been run in a southeast direction 80 feet beyond the south line into the California ground, the entire length of which is in rich ore. Nearly opposite the south winze and about 20 feet from the south line we entered

East Cross-Cut, No. 3,

Following which, a distance of 90 feet, brought us to the face in the right hand corner and bottom of which some fine ore was just beginning to show, and which is believed to be the extension southward of the rich east ore body lying between the 1300 and 1400-foot levels. About forty feet from the entrance to this cross-cut a winze has been started on the left hand side, which was down thirteen feet, the bottom in ore which gives average assays of from $70 to $200 per ton. Returning to the main south drift 50 feet in a northerly course brought us to a west cross-cut, which carries us back 50 feet to where the

Ore Body

Found in east cross-cut No. 1, on the 1300-foot level, was being breasted upon three sets of timbers in width, and which is of much better quality than the ore was in the breasts of the winze 90 feet above. This body is also undetermined in extent, and mills $50 per ton. Again returning to the south drift, 110 feet further to the northward and 250 feet from the shaft, we entered east cross-cut No. 2, of that level, following which a distance of 160 feet brought us to the rich

East Ore Development,

But very recently made. At that point a large chamber has been excavated in the ore preparatory to putting in timbers and stoping. This ore body has been cut into a distance of 29 feet, and in the face, overhead, and on the sides, was one rich mass of sulphuret ore, not a spot showing where either the sulphurets or rich chlorides were not disclosed. The point at which this body was struck is about 60 feet west of where the east development winze is being sunk in the rich ore body lying between the 1300 and 1465-foot levels. The entire body mills $125 per ton, there not being a scrap of waste to be found mixed with the ore. A few feet further on a cross-cut has been run to the northeast a distance of 50 feet, developing fine ore, the milling test of which gave $60 per ton. Returning to the shaft we entered east cross-cut No. 1, which is in a distance of 361 feet from the shaft, at which point is the north air winze, which connects with the 1700-foot level. According to the

Measurements and Surveys

This cross-cut drift will have about 60 feet yet to run to reach the east ore body. The work was being done on the 1700-foot level and we had already spent three hours in the hot subterranean chambers of the mine we were glad to ascend to the surface, more than pleased with our trip, and more convinced than ever of the great extent and richness of the ore developments of the Ophir. The hears and croakers may howl themselves hoarse, but the rich, vast chambers are there to be seen on every hand and no cane man dare go and look at them and then attempt a denial of the fact. And further: the opening up of the rich extensive ore bodies on the 1465-foot level, leaves hardly a doubt but that as soon as the

Air Compressor

Is ready to run, which will be in a very few days, and when cross-cutting on the 1700-foot level is commenced there will be found a continuation of the same rich vein on that level. On the 1300-foot level the ore vein shows that it has been greatly broken up, while on the 1465-foot level the solidity of the ledge and even character of the quartz and ores proves the ore vein, although undetermined in width, to be much better concentrated than on the level above. The value of the mine is established beyond all doubt, and gladly do we welcome back a return of the rich and prosperous days of Ophir's by-gone glory.

Compound Engines of the U. S. Coast Survey Steamer "Hassler."

Mr. Charles E. Emery, consulting engineer, has communicated the following to the *Journal* of the Franklin Institute. If other engineers would follow his example, the question of relative merit between simple and compound engines would soon be permanently settled. We omit the details of the experiments, which seem to have been conducted with great care, and simply give results.

The vessel, on her trial trip, using Schuylkill coal and both boilers, developed 125 horse-power with 250 pounds of coal per hour, a performance of two pounds of coal per horse-power per hour, when the boiler and engines were not felted and the weather quite cold. Only one boiler was in use during the run.

The following extracts are from the official report of Commander P. C. Johnson, U.S.N., commanding the "Hassler."

It gives me pleasure to request your notice of the consumption of coal while engaged in such work as the "Hassler" was designed for.

At San Diego, before starting the fires, the ship had in her bunkers	101.09 tons
To-day on hand	68.30 "
Deduct for distilling water, galley, stoves, etc.	3.60 "
Showing a consumption in 35 days of	29.19 "
Averaging per day	0.83 "

The ship has been under steam every moment since leaving San Diego. Excepting Sundays, she has been under way during the day, and banked fires at night, having steamed 1,069 miles and made 704,026 revolutions. The hunker-doors are closed and locked at all times (except when in the act of getting out coal), and the key always in possession of the engineer. Besides weighing, the bunkers are frequently examined and their contents measured.

In a subsequent letter Commander Johnson writes: We have been 58 days under steam, running from daylight till dark generally. Banked fires at night and Sundays, and have consumed in the furnaces only 1,891.4 lbs of coal per 24 hours—0,844 tons per day.

There is no mistake about it. There has been no stealing of coal. The bunker-doors were locked, except when carving out, and the measurement shows the proper amount on hand now.

Mr. Emery claims that the above facts are sufficient to show conclusively the great economy which may be obtained by the use of the compound engine.

A New Invention.—Colonel Hyde, the steam wagon and plow manufacturer, has been for some time engaged in perfecting a machine for excavating irrigating canals. Much of the work has been done at Gunn's shop, on I street near Front, and the machine is now nearly completed. It consists of a scoop-shaped iron scraper, with a series of teeth that look like sharp plow points. This takes the lead, and will cut a ditch about twelve feet wide. Following it come two revolving aprons which catch the dirt from the scraper and throw it out at either side of the canal. Then comes a powerful steam wagon, something like that which propels the plow; this pushes the scraper and and aprons along ahead, and the engine also causes the aprons to revolve and do their work. The machine is intended for use in irrigating ditches in the San Joaquin Valley, and looks as if it would work admirably in the light soil there. When at work it will cut a canal say two feet deep and twelve feet wide, about three miles per day. The machine will be put together and ready for trial about the latter part of this week.—*Sac. Union, Oct.* 22.

The London Society of Arts offers its gold medal or $105 to the inventor of an improved lamp or means of illumination suitable for railway passenger carriages, that shall produce a good steady, clear, durable and safe light. It must be simple in construction, and capable of being readily cleaned and repaired. In judging the merits cost will be taken into consideration.

Three hundred persons are now working in the Los Prietos quicksilver mines, Santa Barbara county. The mines will soon be made more accessible by a good road.

Cinnabar.—The continued reports of the rich discoveries in Cinnabar district, accompanied by specimens ranging from 50 to 75 per cent., has had a tendency to make those of our citizens who are interested in that District feel themselves millionaires. And not without some cause, for the developments of the past few weeks have gone far toward proving that in Trinity county is located the most extensive and richest deposit of cinnabar in the world. We have seen a $20-piece entirely coated with quicksilver, from a piece of ore but little larger than a pin-head, by simply holding them in a flame; and that ore came from the Cinnabar district of this county. (Where the $20 piece came from we don't know—it wasn't ours.) As yet the only extensive discoveries made have been in the Lytle claim, where the lode was struck about 6 feet below the surface, found to be about 3 feet wide and quite rich. A tunnel was then run and the lode struck at a depth of 70 feet, where the vein proved to be 16 feet in width and immensely rich—a single barrow load producing $400 worth of quicksilver. With two small retorts, Mr. Lytle produced 16 flasks of the metal. These being burned out, he has procured four large retorts which are being put up eight miles this side of the mine, where they could be hauled with wagons. It is Mr. Lytle's intention to transfer five tons of ore from the mine to the retorts, and from this he expects to realize not less than $5,000, the ore averaging over fifty per cent. It is further estimated that, at the present time, Lytle has $100,000 on his dump. The main ledge and all the stringers cut by Lytle run North and South, and the ledge, four feet wide, has been struck on the surface several hundred feet due north from where he found it. A letter from Mr. Lytle to County Clerk, Trotter, received Thursday evening, says that Worland & Butler had just struck it rich in the Boston claim. Further developments are anxiously awaited.—*Trinity Journal.*

An Efficient Safety Cage.—Last Sunday night the hoisting cable at the Belcher works suddenly parted at the reel. At the moment there were being hoisted up on the cage (three-decker) three car loads of ore, weighing over four tons. Without safety apparatus the cage, with its load of cars, would have dropped to the bottom and been dashed to pieces; but as it was the cage dropped but about three-fourths of an inch. The cage, with the safety apparatus and all connected therewith, was made by William Bray, head blacksmith at the Belcher works. That a cage so heavily loaded as that above mentioned should fall so short a distance that it can hardly be said to have fallen at all, is incontestable proof of the efficiency of the safety apparatus with which it is provided. The sense of security with which the safety cages inspire the miners is alone worth thousands of dollars annually. As they pass up and down the shaft they are not in constant fear of the breaking of the cable by which they are suspended in a shaft hundreds of feet in depth. As a proof of this fact we may state that but a few days since we descended the Belcher shaft and were lowered by the same cable that parted last Sunday night. As we descended we said to a miner on the cage: "Should the cable break where would we go to?" "Nowhere! We would stop right here. The safety apparatus would not allow us to fall an inch," was the reply. He was right, we should have stopped and stuck fast in the shaft, and all the weight that could have been piled upon the cage would not have forced it down a single inch. The more weight there is on a cage the more firmly the cogged eccentric wheels of the safety apparatus bite into the guides on each side.—*Virginia Enterprise.*

Channel Passage.—The project to construct a tunnel between France and England, says *Iron*, is assuming a practical phase. The capitalists and engineers embarked in this gigantic enterprise demand a concession of thirty years instead of the ninety-nine usually accorded to railway companies, and ask for neither guarantee nor grant. Further they are ready to advance a sum of four millions for preliminary investigations. The project in question consists in the immerging of a duct on the English and French coasts, and the boring of two long galleries from each side. The soul of the enterprise, with MM. Michel Chevalier, Leon Say, and Rothschild, is M. Lavalley, an engineer who has surmounted the greatest difficulties in the construction of the Suez Canal and without whom this gigantic enterprise could not have been accomplished. M. Lavalley estimates the cost of the work at 150,000,000 francs. The English engineers think it will amount to 250,000,000 francs. He suggests that this work should be done partly by France and partly by England, and that to induce the two countries to proceed on this undertaking energetically there should be a bonus for the one which works the fastest. The 4,000,000 francs forming the preliminary capital are nearly all, it is said, subscribed.

The litigation between the Excelsior and Fourth of July mines of the Eureka district has been compromised, and the suit withdrawn from the Court by the Excelsior paying costs. The case was in the United States District Court at Carson.

A registry for artizans out of work has been founded in London, where for a fee of six cents the applicant's name is registered, and the fact that he needs employment is announced in a paper without further charge.

Snow Creek Mining District.

A short time ago David Butler and others discovered what promises to be one of the richest mining districts in Northern Nevada, ten miles from Bartlett creek, and about seventy miles "as the crow flies" northwest from Winnemucca. Upon making the discovery the prospectors organized a new district which they named Snow creek, and located six ledges all of which crop out to a greater or less extent, and contain free gold and silver-bearing ores. On the largest and most promising of the ledges, named Belle of the West, a shaft has been sunk to a depth of fifteen feet, and the ore assays from $244 in silver and $95 in gold, to $1,500 per ton. Pieces of the ore burned in an ordinary fire yields almost pure silver, and is so tractable as to be easily amalgamated by ordinary mill process. The formation in which the ledges are found is granite, and bears a close resemblance to the country at Silver City, Idaho. There is plenty of timber and water in the mountains in which the ledges have been discovered for all practical purposes; and the valleys, unlike the deserts of Central and Southern Nevada, are covered with luxuriant grasses. The soil is alluvial, and susceptible of a high state of cultivation. Deer are plenty in the mountains, and the streams are literally alive with trout. The whole country is represented as being the most inviting in the State to farmers and miners. A road from Leonard creek to the mines is being built as rapidly as the means of the mine owners will admit of, and will be completed in a few weeks.

David Butler brought 2,500 pounds of ore from the Belle of the West to Gintz & Ginacca's Reduction Works last Saturday, for the purpose of giving it a fair, practical test; and if the result is as good as is anticipated, lively times may be expected at Snow creek this winter, and an express line for the accommodation of miners and others in that vicinity will be started immediately from Winnemucca.—*Silver State, Oct.* 19.

Ink.

We might bring many other accusations against ink. Among them is the difficulty of carrying it about. The patent bottles, which open like a jack-in-the-box were no doubt a great discovery, and are as convenient as may be. But bad is the best. For the ink when long shut up acts as a glue upon the lid, whether you give way or opens with a jerk and makes a mess. It is almost impossible to keep ink in good order. The best part of it sinks to the bottom of the pot, like the cream in good London milk. If it is not frozen in winter or dried up in summer, it gets full of hairs, or becomes a cemetery for the dead bodies of flies. There is nothing among the small worries of life more trying to the temper than when the pen at every dip is clogged with something that makes writing impossible. Ink is almost useless without a paraphernalia of other things. You must have pens whose nibs, however good, are corroded after a few hours writing with the acid in the ink. You must have either sand or blotting paper, an inkstand, an ink-eraser, a pen-wiper, etc. But it may be asked after all this abuse of ink, what can be offered in its place? One cannot draw up decds in pencil or write histories in blue chalk. No doubt the one merit of ink is that it is practically indelible. But surely in these days of chemical science we need not be driven to galls and water in order that what we write may not be rubbed out. There must be some means of preparing a paper such that the mere touch of a chemical pencil should make an indelible mark. The man who should confer this boon on the public would deserve a prize medal at the next exhibition. But perhaps we should say good-by with sadness to ink, after all. For ink would be to the new compound what the old stage coach is to the train. The poetry of writing would be gone. With a chemical pencil on chemical paper, the old triumphs of penmanship, the ups and downs, and flourishes produced by fine nibs would no longer be possible. True, we should be saved the trouble of dipping our pens, but how often does an inspiration come at the moment of rest, when the pen needs filling? And as to wiping it, there is a positive pleasure in wiping a good pen when it has done its work satisfactorily. —*Saturday Journal.*

A free wagon road is proposed by way of the Feather river gorge, through the Sierra Nevada mountains from the town of Oroville, in Butte county, California, to Sierra valley, in Plumas and Sierra counties, a distance of about 130 miles. At present there is no communication through this county for six months of the year, except across rugged, snowy mountains, at an altitude of 6,000 or 7,000 feet; and such is the communication at all seasons of the year that the region is comparatively uninhabited, notwithstanding its great mining, timber and agricultural resources.

London is literally built on a foundation of pipes. In some places it would be difficult to find room to lay another pipe. One gas company supplies two districts with nearly four hundred miles of pipes. Then there are the underground telegraph pipes, and 2500 miles of drain-pipes, the lead and iron pneumatic tubes, the sewers, the water pipes, and the underground railway.

Fifteen tons of manganese ore arrived at Stockton, Monday, from the vicinity of Jackson, Tuolumne county, for shipment to Baltimore.

MECHANICAL PROGRESS.

The Cause of Temper in Cast Steel, and its Effect upon its Physical Structure.

The physical structure of cast steel is composed principally of molecules of iron. Those molecules are held in a fixed corrolative position by virtue of the molecular forces; and between contiguous molecules there exists certain cavities known as physical pores. It is conceived that carbon is absorbed and retained within these pores by the force of attraction exerted by the molecules or iron and the atoms of carbon.

The molecular force of attraction is opposed by another force which is due to heat, and the balance of these forces is called the resultant force. These forces exerted by contiguous molecules being balanced in each physical pore, each pure represents a distinct resultant force; therefore the resultant force may vary in different pores. If so, the absorption and retention of carbon will not be uniform.

Any variation of temperature in any part of the structure will cause a corresponding change in the resultant force in such pores as are subject to such change. And as this force attracts more or less carbon, in proportion to its intensity, it follows that a change of temperature in any part of the structure causes a redistribution of the carbon. Hence, I conclude that though the molecules of iron are fixed in a correlative position, that the carbon is transitive, subject to be withdrawn from pore to pore, as the resultant force exerted at each point changes.

When a "cold chisel" made of tool cast steel is heated and suddenly cooled, the point will be white and brittle, because the point being thinnest cooled quickest, and as the temperature was reduced, the molecules were drawn closer together, the resultant force increased, and as each modulus of force absorbs its equivalent, the accumulation of carbon was greatest at the point where the increase of the force was most rapid and greatest, it being so great as to fill the pores to excess, and when the temperature was reduced to the point where the carbon crystallizes, the contraction of the molecules were retarded, and the structure subject to an internal strain. Therefore it becomes necessary in tempering a "cold chisel" "*to draw the temper*. This is done by cooling the point until it is white, and by holding it in the air for a few seconds the heat from the upper part is diffused toward the point, enlarging the pores, reducing the resultant force, and redistributing the carbon; and thus by graduating the resultant force, the distribution of carbon may be graduated, securing the largest amount in the extreme point, and a less amount in the background, where elasticity is desirable to cushion the blow.

The transition of carbon from pore to pore, and the volume at any point, is indicated by varying shades of color displayed on the surface of the steel. These varying shades, I apprehend, are caused by a variable resultant force—physical pores of varying size, and a variable density of structure. All of which are due to the molecular force, and the transitive character of carbon.

Tempering cast steel does not disarrange the molecules in their correlative position, but as carbon exerts the force of attraction in a much greater degree than iron, its presence in the physical pores adds largely to the resultant force of the physical structure, drawing the molecules nearer each other, thus reducing the size of the physical pores, and these pores being filled with carbon, the molecular undulations are retarded, elasticity is lost in rigidity, and porosity in density. That part of the structure which is cooled quickest and coldest, will possess the smallest physical pores, and as the greatest force is exerted in the smallest pores, it follows that the greatest absorption of carbon will be there. Thus the smaller, colder and stronger pores are enabled to rob the larger, hotter and weaker pores of a portion of their carbon, and this transition does not stop until an equilibrium has been established.

In conclusion, the comparative density, hardness and strength of cast steel is due to the molecular forces. The phenomena of temper (that is, one part of the structure being made harder than the remainder) is due to the transitive character of carbon. Tempering cast steel is merely an unequal distribution of the carbon. Nothing is added to the structure, and if performed with care nothing should be lost.—*Cor. Iron Age.*

PREMIUM FOR CIRCULAR SAW.—The Board of Commissions of the Cincinnati Industrial Exposition for 1874, offer a special premium of $100 in gold, in addition to the regularly advertised premium, for the best circular saw. The conditions for competition are: The saws must all be 56 inches diameter, teeth either inserted or solid, gauge at option of exhibitor, eye 2 inches diameter, pin holes ⅝ inch, and 3 inches from center to center. The saws will be tested on the same engine, while diagram cards are taken from the engine during the performance of each saw. This offer is made at the request of the western lumbermen, who are very much interested in good saws and also confident that notwithstanding late years have shown many important improvements in this line, still further economical improvements can be accomplished.

STRENGTH OF BOILER IRON IMPAIRED BY HEATING AND CHILLING.—It is well known that repeated concussions produce a change in the texture of wrought iron, causing it to pass from the fibrous to the crystalline state. It is not so generally known that a similar change takes place, superficially at least, when fibrous wrought iron is heated very hot, and suddenly cooled. Prof. Kick, whose experiments in iron are well known, heated the best Styrian boiler plate in a muffled furnace, not to a red heat but nearly so, and then chilled it. On breaking it was found that the exterior layer, to the depth of about one millimeter, was crystalline, while the inner portion exhibited the same fracture as before heating. In a second experiment another piece of the same material was heated to a bright red heat, dipped in water and broken. In this case, also, the surface layer was crystalline, but more distinctly so than before. The plate tested was 10 millimeters—two-fifths of an inch thick. If the experiment is made with thin plates the change of texture, as might be supposed, extends all the way through the plate. Since the change from a fibrous to a granular structure is attended by a corresponding diminution of strength, this fact may be deserving of notice in the management of steam boilers. If boilers are left empty for some time after blowing out, between hot walls, and then fed with cold water, there must be, in addition to the injurious contraction, a molecular change on the inner surface of the boiler.

WERDERMANN'S PROCESS FOR RE-SHARPENING FILES.—If this process is reliable it must be of immense importance. The *modus operandi* is given as follows: Well worn files are first carefully cleaned with hot water and soda; they are then placed in connection with the positive pole of a battery, in a bath composed of 40 parts of sulphuric acid and 1,000 parts of water. The negative is formed of a copper spiral surrounding the files, but not touching them; the coil terminates in a wire which rises toward the surface. This arrangement is the result of practical experience. When the files have been in the bath ten minutes they are taken out, washed and dried, when the whole of the hollows will be found to have been attacked in a very sensible manner; but should the effect not be sufficient, they are re-placed in the bath for the same period as before. Sometimes two operations are necessary, but seldom more. The files thus treated are to all appearance like new ones, and are said to be good for 60 hours' work. M. Werdermann employs twelve medium Bunsen elements for his batteries.

THE METALINE LUBRICANT.—Considerable has been said from time to time in regard to the new lubricant known as metaline, which it has been claimed has proven quite successful as a substitute for oil. The material is a peculiar alloy which is inserted in cavities made in the interior of the journal boxes, and its effect is to form a thin film over the opposing metal surfaces, and to prevent either heating or cutting. At the late American Institute Fair in New York there was exhibited a counter shaft, speeded to 750 revolutions, in which the bearings were cut down to the diameter of the shaft, one inch. This communicated motion to a short emery grinder spindle, speeded to 3,500 revolutions, and the latter to a cotton spindle, which runs at 14,000 revolutions. It is reported that there was not the slightest cutting visible under these very high speeds, and the amount of heat developed was barely discernible by the touch.

The *Scientific American* says a company has been formed to carry out the invention by supplying bearings of all kinds. According to the same authority this substance has been used on a slotting machine at Patterson, N. J., since 1870, which has never been renewed although the bearings on the same machine always cut with oil.

A SINGLE STAVED BARREL.—An Indiana firm have patented a process which they are employing, by which a barrel is made consisting of only one stave. This is accomplished by turning a steamed log, of the length of a barrel, against a sharp knife of the requisite length, and thus cutting it into a continuous sheet of wood of the thickness for a barrel stave. Enough of this ribbon of wood is then cut off for the circumference of a barrel, and crozed or chamfered by suitable machinery. To give the barrel the proper shape, slits are cut in the two ends by a gang of saws, and the heads are thus brought to the requisite size as compared with bilge. The usual number of hoops are put on, and the barrel thus made is said to be equally as strong as those manufactured in the ordinary way. The principal saving is in the amount of time and labor involved in the process, the cost of material being about the same as in the ordinary manufacture.

INCOMBUSTIBLE WOODEN SHIPS.—The English admiralty is going to put the wood made incombustible by the new chemical preparation the tungstate of soda, to a very severe test. A vessel is being built of which all the wood has been thus prepared. After it has been launched, it will be filled with all kinds of combustible matter, which will be set on fire, then it will be exactly known what results can be achieved in this way. If favorable, wood has the advantage over iron in lightness, absence of rust, and consequent durability, cheapness, less expense in preservation and elasticity, as wooden ships are not subject to leakage after shocks, as is the case with iron vessels at the joints of the plates.

SCIENTIFIC PROGRESS.

The Divisibility of Matter.

An article in the *Journal of Applied Science* says: "So far as our senses, aided by the most powerful microscopes, are able to discern, matter is infinitely divisible. Chemical experiments seem to prove that there is a limit beyond which we cannot go. Let us take a particle of chloride of silver and subdivide it until we reach that limit, and the infinitely small particle of chloride of silver which remains to us is called a molecule. Let us divide the molecule and we have no longer a particle of chloride of silver, but an atom, each, of chlorine and silver. A molecule is so small that it cannot be divided without breaking it up into its constituents. When water is heated and converted into steam, the particles of water become so small that they are invisible; as the heat increases the particles of water break up into smaller ones, until finally the molecule is reached; then increase the heat still more, and the molecules break up into atoms of hydrogen and of oxygen. To this particular phenomenon the name of dissociation is applied. Assuming, then that all matter consists of atoms united in the form of molecules, which may be simple or complex, we have one principle on which to base our system of notation. These atoms, being indivisible, as the word implies, must have certain definite weight, which weight has been relatively ascertained by careful experiments. Ampere has satisfactorily established the following law, that equal volumes of all bodies in the gaseous state contain the same number of molecules. Hence it follows that the molecules of all bodies, when in the gaseous state, are of the same size. This makes it a very easy matter to ascertain the weight of a molecule of any given substance, if that substance be a gas or convertible into gas. Oxygen is sixteen times as heavy as hydrogen; hence if we call the molecular weight of hydrogen two, the molecular weight of oxygen must be thirty-two. Having learned the molecular weight of any simple substance, by finding its specific gravity as referred to hydrogen, we only need to divide that by its atmospheric weight to find how many atoms there are in the molecule of that substance. The atomic weight of oxygen is sixteen, its molecular weight is thirty-two, hence there are two atoms in in its molecule. With a very few exceptions, molecules of all simple substances contain two atoms each. The molecule of a compound body may contain one or more atoms of several different substances, but it always remains of the same size, even if it contains fifty atoms."

ELECTRIC AND GAS LIGHTS.—The London *Daily News* furnishes some interesting comparative information as to the relative value and cost of electricity and gas for lighting purposes. It appears that there are two lanterns placed upon the clock tower of the Houses of Parliament, at an elevation of 250 feet. One of these lanterns is lighted by gas and the other by electricity. The gas light has three burners each composed of 108 jets. The electric light is produced by an electro-magnetic machine, worked by steam power. The House of Commons has just published a report on the comparative value of the two lights which is decidedly favorable to the electric light, which throws off 65 per cent. more light than can be obtained from one of the 108 gas jets. Then as to cost; the electric method gives a saving of 162 per cent., measured in cost per candle, per hour, when a 108 jet gas burner is used, and of 133 per cent., when three burners are used.

STRAW AS A CONDUCTER OF ELECTRICITY.—An extraordinary account has appeared in a French agricultural journal, to the effect that straw forms admirable lightning conductors. It had been observed that the straw had the property of discharging Leyden jars without spark or explosion, and some one in the neighborhood of Tarbes had the idea of constructing straw lightening conductors, which were formed by fastening a wisp or rope of straw to a deal stick by means of brass wire, and capping the conductor with a copper point. It is asserted that the experiment has been tried on a large scale around Tarbes, eighteen communes having been provided with such straw conductors, only one being erected for every sixty arpents or 750 acres, and that the whole neighborhood has thus been preserved from the effects, not only of lightning, but of hail also. The statement comes from a respectable source.

WROUGHT IRON AND GASES.—Dr. A. P. S. Stuart stated before the American Association at Hartford, that an unglazed wrought iron tube, when deprived of air and heated, allows hydrogen gas to pass through its pores, but when externally glazed and heated, such a tube becomes perfectly impervious to gases. Such a tube was therefore, for obvious reasons, well suited for making nitrogen determinations; and experiments, so far as they have been made, promise excellent results. During the experiments made by the writer on this subject, his attention was called to an inference of Prof. Graham on the origin of hydrogen in meteoric iron, and the suggestion was made that possibly such hydrogen did not come from the celestial spaces, but from water decomposed by the hot iron when it was buried in the earth.

The British Association of Science.

The following are abstracts of various subjects discoursed at the late meeting of the British Association for the Advancement of Science:

"Recent experiments conducted at high pressures, by Professor Andrews, show that the compressibility of liquid sulphurous acid (unlike that of water,) diminishes as the pressure increases. In a mixture of three volumes carbonic acid to four of nitrogen, even at two degs. F., carbonic acid cannot be liquified under any pressure. In short, the critical point (a term introduced into this branch of science by Professor Andrews) of carbonic acid becomes lowered many degrees when that gas is mixed with a nonliquifiable gas, such as nitrogen.

The flight of birds. Professor Guthrie, in relation to the hovering of birds, states that, when the bird desires to hover over a given spot, it moves by an expenditure of muscular force until it finds a region where one layer of air is moving, say, from right to left and another from left to right. Then placing its body and most of its right wing in the lower stratum, it tilts its body so that some of its left wing is in the upper layer. By altering its hight, by turning one wing in its socket, and probably also by turning some of the pen feathers on their axis, and altering the inclination of its wings, the bird so governs the pressure on the two wings that the sum of the vertical revolved parts is equal to the bird's weight, while the horizontal revolved parts are equal and opposite.

A self registering apparatus for measuring the chemical action of heat is described in a paper by Professor Roscoe. The tint produced by the exposure of a certain prepared sensitive paper to the sun can be measured on a self-registering principle. By this means can be determined, with a great degree of accuracy, the relative amount of chemical action falling upon the earth's surface from the sun and the variations which take place from hour to hour, day to day, and season to season in that action.

Improved telescopic lenses. Professor Stokes says that, if opticians can manufacture glass containing terborate of lead or titanic acid, lenses made therefrom will greatly decrease secondary dispersion. Phosphatic glass might answer the same purpose, but it has the objection of being too perishable and too soft.

The decomposition of eggs, according to Mr. William Thomson, is due to three agencies: First: a putrid cell capable of being developed within some eggs, no matter how effectually their shells are protected by varnished coverings. This is generated in the yolk, in which the minute granules assume a morbid vitality, absorb oxygen, and liberate carbonic acid gas. The second form is a vibrio. If the shell of the egg be allowed to get wet, the dried bodies of these animalcule existing in the atmosphere develope in the water, assume vitality, enter the shell, and set up putrefaction. The third cause is a fungus, also derived from the atmosphere, which, settling on the shell, sends myriads of filaments through the same, converting the white into a strong jelly. It is strange that this fungus acts on the air like animalcule, absorbing oxygen and liberating carbonic acid gas.

Comets and the Comet of 1874.

W. Tegg & Co., an English publishing house, has collected in a little treatise about all that is known as to the matter and motions of those erratic and little understood bodies called comets. In alluding to our late cometary visitor, we are informed on the authority of Father Secchi and Dr. Huggins that the spectrum of its nucleus resembles that of carbon; and they also found that about one-sixth of its light was polarized. The laws of cometary motion are even less understood than their chemical constitution, for they change their paths as well as their aspects so often and so widely that identification is impossible. Some are even suspected, with good reason, to be wandering visitors of many more sidereal systems than that of our own sun, and many of them are suspected to have parabolic and hyperbolic paths which never return into themselves. The continuous changes which they assume under observation are curious and unaccountable, and no less so in their behaviour in approaching or receding from the sun, which sets all theories of gravitation at defiance. The vibrations of their tails and other phenomena connected with that appendage also perplex the minds of astronomers. Occasionally comets have come very near the earth. Indeed, it is stated on high authority that the earth passed through the tail of the comet of 1861 on the evening of the 30th of June of that year, and Arago has suggested whether the extraordinary mists which in 1783 and 1831 covered a large part of Europe may not have been the result of an admixture of the vaporous particles of comets with the terrestial atmosphere. Comets are further considered, as respects the length or shortness of their periods, and as to their density or rarity, and the various theories of Herschell, Laplace, and others, described and discussed. Of their numbers we are told, in the words of Kepler, that they are as numerous as fish in the sea; a statement to which is added the further one that most comets of our system are visible to us, but the impression left on the mind, after a recapitulation of the observations that have been made upon comets, is that no reasonable hypothesis has yet been constructed regarding them.

The "Mining Bureau."

If there were such a thing as a "Mining Bureeu" the officers of which were perfectly honest and above suspicion, it might be of some benefit to purchasers of mines. But the temptetions are so great and the opportunities are so many, that bureaus have never been a success. Even if the officers were models of good faith and honor tbe public would not believe in the bureau, because there would he so many chances for fraud that it would be difficult to suppose that there was none. Men with capital wbo want to buy mines can get plenty of experts to examine the properties offered, without the necessity of going to any bureau for information; and there is much more chance for honesty in an individual mining engineer, with a reputation to nphold, than there is in a mining bureau, where the responsibility is divided among so many persons. Noue of these bureaus have ever prospered here, nor is it likely they ever will. There has been the semblance of one hovering about for some time, but even this has been broken up. And it is well it has been, for judging from the reports of a case in wbich this bureau figured largely—or rather its representative did—the whole thing was a swindle. The *Chronicle* of this city deserves great credit for having made a fight ageinst the swindle and even more credit for having proved it a swindle, both in and out of conrt. Mr. J. Berton, the head of this bureau, sued the *Chronicle* for libel, for commenting unfavorably on him and his bureau, and after the case was tried the suit was dismissed. In the judge's decision, as reported by the *Chronicle*, he said: The defendants called Berton "a fraud and an adventurer," and the testimony beers them out. A Mining Bureau would be a good thing if it were possible to conduct it honestly. Berton got one up and had full control, and with one other man, Linden, ran it, violatiug every law adopted for its government. Every other member left it in disgust in consequence of its corruptions, even to the Secretary. He then reviewed the attempt to blackmail the Knox & Boyle owners, commenting very severely upon Berton's apparent scoundrelism. He concluded as follows: The Miniug Bureau is unquestionably a fraud of the grossest kind—it is the most corrupt institution I ever heard of. I find that the defendants were justified in their publication, which was warranted in the interest of the community and in accordance with their duty as journalnete to the public. I now discbarge tbem from custody.

This is pretty strong langnage; but we ehould judge by the testimony that it was warranted. Mr. Berton, wbo was "Vice Consul of France" at Sacramento, the capital of this State, has tendered hie resignation and it is about time that he did. The *Chronicle* has tbe credit of unearthiug this fraud and of bringmg the thing before the community in euch a light that it would not be misunderstood.

Mining Accidents.

Last Sunday John Andrews had his thigh bone broken by a cave on the 1,100-ft. level of the Crown Point mine. He also received contnsions on different paits of bis body. On Tuesday James Wood fell th rough a set of timbers on the 1,400-ft. level of the seme mine, but escaped without having any broken boues, altbough severely bruised.

On Thursday of last week a miuer named William J. Blnnt accidentally felldown a chute in the Consolidated Virginia miue 70 feet in depth. He was badly bruised in the region of the spine, bnt no bones were broken,

On the same day Patrick Sullivan, a workman iu the Consolidated Virginia mine, while pursuing hie lebors on the 1,500-foot level, tbe plaukiug on which be was standing gave way, precipitating him into a winze. He fell about forty feet, etriking on his back. He ie severely jarred end injured internally.

An accident occurred last week at the Richmond smeltiug worke at Eureka, occasioned by tbe sudden breaking of the belt of the fan. The shaftiug was considerebly twisted, a pulley cent through the roof of the house, and the machinery generally put out of gear.

A dispatch from Virginia deted the 28th says: As tbe seven o'clock shift were coming np the incline of the Yellow Jacket mine this morniug, a man by the name of John Quinn, who wae seated on the hind end of the giraffe, had his back broken by coming in contact with some of the timbers overhead. Upon examination, it wae diecovered that two of the vertebral joints had parted and slipped past each other. His recovery ie a matter of greet uncerteinty. Quinn had been working in the mine only about two weeks. Tbeacoident was a very unnsuel one, and that the man ehould bave got such a terrible thump seems etrange, when on the morning of the fire in the Yellow Jacket, twenty three men rode upon the eame giraffe in safety at one time. Quiun has a wife and three children depending on him for their support. Even if he doee not die, he will probably never be able to labor any more.

MINING SHAREHOLDERS' DIRECTORY.

Cnmpiled every Thursday frnm Advertisements in the Mining and Scientific Press and nther S. F. Journals.]

Mining Stocks.

Although reports from the principal mines dealt in on the Stock Board continne favorable, the stock market for the past week has been quite dull. Transactions have been comparatively limited and prices have ruled low. On Thursday there was a tumble in stocks and everything fell. It ie hardly probable, however, that the "bottom will drop ont" of stocke just now, with ench wonderful ore developmente ae are now being made in Ophir, Cons. Virginia aud Belcher, and with the very flattering prospects of snbstantial value in Overman, Confidence and Justice.

New Incorporations.

The following companiea have filed certificates of incorporation in the County Clerk's Office, San Francieco:

NOTRH CARSON S. M. Co., OCT.24—Eagle valley, Ormeshy county, Nevada. Directors—L. D. Brown, C. W. Fox, Nathan Leigh, C. E. Ivy and J. H. McCrory. Capital stock, $5,000,000.

JUPITER G. M. Co.; OCT. 27.—Location: El Dorado County. Directors—Alpheus Staples, C. M. Peck, C. J. Eaton, Robert Aitken, J. J Holmes. Capital atock, $3,000,000, divided into 30,000 shares.

WILLOW CREEK S. M. Co., OCT. 27.—Location: State of Nevada. Directors—James Morgan, J. R. Hardenhurgh, J. B. Fargo, George Dodge and Solomon Heydenfeldt. Capital stock, $2,000,000, divided into 20,000 shares.

KNIGHT'S VALLEY LAND AND CONTRACT Co,. OCT. 28.—The object ie to carry on the business of mining and agriculture in Napa and Sonoma counties. Directors—Wm. A. Stuart, E. W. Steele, G. P. Kellogg and Charles Laird. Capital stock, $600,000, divided into 6,000 shares.

EUREKA BULLION.—The bullion report for the past week at Eureka shows a decline in both production and ehipmeut when compared with that of previous weeke. This is owing to the fact that the Ruby Conecolidated and Hoosac furnacee bave not been running and the accident at the Richmond on the 20th instant, spoken of in another column. The latter company are now running only two furnaces, No. 2 being repaired. The bad oondition of tbe roads has materially interfered in the speedy transportation of bullion to the railroad, the wagons not being able to carry more then half loads for the past week. The *Sentinel* etates that the bullion shipment for the past week was 391,280 pounds. The prodnct for the week was 437,055 pounds.

FOUR timee as many patents were issned in thie country last year as were granted in England during the same time.

THE San Bernardino *Guardian* says: "The Carter mine, Holcomb valley, will shortly rival even Panamint in interest. Indeed, had such operators as Jones and Stewart taken hold of Bear velley, Panamint would be in the shade."

IT ie reported that work will be commenced on the 8,000-foot tunnel through the monntain near San Fernando on the Southern Pacific Railroad. When this is done we will have railroad conuection from thie city to Los Angeles or even San Diego.

PANAMINT and San Bernerdino will soon be connected by telegrapb.

Gathering and Storing Winter Apples.

People in rigorous climates are in many cases compelled to do just what those in mild climates ought to do, but will not, because they are not compelled to. One of these timely but compulsory labors in the Eastern States is gathering and storing winter apples. Impelled by their dread of frosts, which may be expected in the latter part of September to be sufficiently severe to spoil the nnharvested apples, they attend promptly to this important product, and gather it in about the time when it should be gathered without considering the frost.

If the growers of Californie winter fruit would give more attention to gathering and storing it—apples especially—it would be much better for both producer and consnmer. Apples should be harvested—being carefully picked—as soon as they are ripe, before they show an inclination to fall from the tree. They should be assorted and graded, being carefully handled in every instance. All except the perfect ones should be fed out or converted into cider. The reserved fruit should he placed in a dark room, having a moderately dry atmosphere of equable temperature. Avoid pressurs from weight as much as possible. Plece them in shallow bins or racks, tier above tier, and during the storage season devote a spare hour occasionally to examining their condition, and turn the fruit.

Now, the labor end expense that this calls for is trifling; but it is all that is needed in this country. It is as nothing compared with the treatment which winter fruit demands in the Eastern States. There tbe apples must be picked about the middle of September, and housed above ground until winter fairly sets in. Then a wall about three feet high, and of abont the same thickness, composed of fresh stable manure, tan-bark, or common earth, must be constructed about the cellar on all sides; and in this steaming, nuventilated pit, the apples are to be placed. Tbe apples of the East, under any system of storage, are more liable to rot than those of California; and being more juicy the rot ie soft and wet, and more contaminating. A rotten apple will not only spoil all with which it comes in direct contact, but will infuse a bad odor into apples a yard distant. This rot spreads rapidly, and necessitates picking over; and this, it will readily be seen, ie an irksome, nnpleasant task. Still, by attending strictly to it, tbe people of the East are enabled to enjoy apples the year round, and at as low rates as we get them here. They have their early winter, late winter and spring applee; with golden and Roxbury russets, which last nntil apples come egain.

If a system balf as expensive and laborious were practiced in California, we also could have epplee all the year round, and the market would retain an equable, healthy tone, the producer being able to regulate tbe supply by the demand.

The importance of using all available meens for furniehing a succession of fruite throngb the winter, spring and early summer season, ie, in our opinion, only second to tbat of drying our surplus of fall frnit. The welfare of both producer and cousumer demands attention at this point. The time of year for which tbis system provides is just when fruit is most needed; and there ie no adequate reason why we ehould not have it in abnndance. It is not enough that it is obtainable as a luxnry; it should be placed within the reach of tbe poor at all seasoue. We believe that providence designs that the poor of this country shall have fruit as well as bread to eat; and failing to get either, it will be a difficult matter to make them believe that the fault all lies with ths middlemen.

On the 1st of November next the Virginia and Gold Hill Water Company will commence laying their pipes from Lower Gold Hill to Silver City. The material required for thie pnrpose has been ordered from the East and will arrive in a few days.

THE two furnaces erected for the California Borax Company, at Sulphur Banks, Lake county, are proving quite a success. They produce daily, from the lowest grade ore, twelve or fifteen flasks of quicksilver.

NINE furnaces are now buey at Eureka, and together they produce about seventy tone of argentiferone lead per day. The base bullion contains on the average about $200 in eilver to the ton.

WORK is to be reeumed on the Emme mine. The company have made an arrangement with T. W. Park, who has the property nnder attachment, by which the owners take possesion.

MINERS in Calaveras county are actively preparing to resume operations. The canal is running at least two-thirde full, and there is no danger of a diminntion of the volume this season.

THE Carson City mint is being eularged. Upward of half a million dollars will be coined this mouth—the largest amount of work done in one montb since the mint started.

Mining Summary.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

California.

AMADOR COUNTY.

Amador Quicksilver Mine.—*Ledger*, Oct. 24: The latest intelligence from this mine is very encouraging, and the indications now are that the mine will soon be developed into a very valuable one. At the depth of 35 feet a drift was run a little south of east, and a very fair vein of ore was struck; afterward the main shaft was sunk to the depth of 75 feet, and a drift run from the bottom of the shaft immediately under the upper drift, and, after blasting through the wall, the same vein of ore was again discovered, clearly proving the vein not only to be regular, but that the ore was confined between clearly-defined walls. The vein carrying ore has thus been proven to the depth of 75 feet, and clearly dissipates all doubts as to its being a regular formation. We are informed that the ore taken from the 75-ft. level looks remarkably well.

CALAVERAS COUNTY.

San Bruno.—*Chronicle*, Oct. 24: A small crushing of eighty tons of rock from the San Bruno mine, at Mosquito, yielded $2,100. That is an average of $26.25 per ton—a good yield for quartz-sorted rock. We learn that the owners of the mine intend putting up steam hoisting works immediately.

DEL NORTE.

Gravel.—Cor. Crescent City *Courier*, Oct. 24th: The work of breaking through the vein-rock of the Happy Camp mine is progressing satisfactorily. The ground prospects well, the bed-rock shows gold at every hand, and the clearing up of the bed-rock through which the cut runs yields $2,000.

INYO COUNTY.

Panamint.—*Independent*, Oct. 24th: E. A. Reddy, we learn that the machinery for the big mill for that place is beginning to arrive. The Stewart and Jones companies are working every available man (to say nothing about some 90 Chinamen) in the camp, preparing for the mill, building freight and ore roads and upon their mines. The camp displays an extraordinary amount of activity. The number of persons in the camp is about 500 or 600.

A Mill for Gold Mountain.—General Page informs us that in a very few weeks he will have a fine new new mill in full blast at Gold Mountain. It is to have but five stamps but they weigh 1,000 pounds each, and on the rich ores of that district will doubtless turn out piles of bullion.

LAKE COUNTY.

Quicksilver.—*Bee*, Oct. 22: Last week some very rich deposits of quicksilver were reported nearly opposite Lakeport. The two furnaces erected by Mr. C. A. Luckhardt, for the California Borax company, at Sulphur Banks, are proving quite a success. They produce daily from the lowest grade ore, 12 or 15 flasks of quicksilver.

MARIPOSA COUNTY.

Mine Bonded.—*Gazette*, Oct. 24: The Harbert mine, situated near Fine Gold gulch, Upper Fresno, has been bonded to Mr. James McMachin for twelve months. Mr. McMachin informs us that it is his intention to set a gang of miners at work immediately, and thoroughly test the mine.

NAPA COUNTY.

The Mines.—*Free Press*, Oct. 24th: Captain E. Green informs us that they have two furnaces, one a Knox & Osborn, and one of his own invention, at work and are turning out ten flasks per day. They have just commenced operations and their machinery is not in good running order. When everything is in good running order they will turn out about 30 flasks per day. The Great Western is considered by all to be skirting the hills. We expect ere long, to pay a visit to the Western and will give a full description of it. About 150 men are now employed. Mr. M. Freidburg of the Geyser mine, showed us some rich rock this week, which for richness cannot be surpassed. He says the further they get into the tunnel, the richer the rock proves. All connected with the mine are highly pleased with the prospects. Alex. Badlam informs us that he will ship eight silver bricks next Monday from the Calistoga mine to Borland & Deane, San Francisco. Alex's face is all smiles, and his boots are as large and "foxy" as ever.

A Copper Mine.—*Reporter*, Oct. 24th: W. B. Roberts of Yountville, is the fortunate discoverer of what he claims to be a good copper mine, on St. Helena mountain. Since the Calistoga mine has proved the richness of Mount St. Helena in silver and gold, there is no limit to the discoveries of mines on it—nor of their kind.

Pope Valley.—*Register*, Oct. 24: The Washington continues on as usual, taking out ore and reducing. The Rucker is prosecuting the work of development. They have a shaft down to the ledge, and a tunnel started. A gold-bearing ledge has been discovered, and a number of specimens were lately sent down. The Etna company are working on the Valley and Silver Bow mines, taking out very fine ore. Messrs. Norton and Kester went up Monday to put in a new blower, and with a good stock of ore on bond it is expected that a rich yield of quicksilver will be the result.

NEVADA COUNTY.

Omaha.—*G. V. Union*, Oct. 28: We yesterday saw some splendid rock which had just been taken out of the Omaha mine. The specimen was firm and lively quartz, showing richly in free gold and plentifully studded with rich sulphurets. The specimen was taken out at a depth of 160 ft. The ledge there is about 16 in. thick, and is enclosed between perfect walls. The shaft is still sinking for a third level, and is about 40 ft. below the second. Water is quite free in the bottom of the shaft.

Moore's Flat.—*Union*, Oct. 25: Times are very lively. The mines are running full handed and some splendid clean-ups have been made during the past week, among which is one made by the Illinois company. After a six weeks' run they cleaned up $11,000. The Bluebank company cleaned up in the neighborhood of $12,000 after a short run.

Pittsburg.—*Tidings*, Oct 24: A crushing of 15 tons of Pittsburg ore cleaned up at the Larrimer mill this week is said to have resulted in the product of $900 in gold, or $60 per ton, and over two tons of sulphurets, assaying at the rate of $250 a ton. The shaft of this mine is now down over 100 ft. and the first level started.

The great tunnel at North Bloomfield is nearly completed and the work of taking out dust, many little grains of which it will take to reimburse the millions of dollars expended on this work, will soon be the programme. This is understood to be the greatest gravel mining enterprise ever undertaken in California.

Large Blast.—*Transcript* Oct. 28: W. A. Roberts, of the Manzanita mine, has been having drifts run and will in a day or two put in a blast of between four and five hundred kegs of powder. The Manzanita, we learn, will be worked with all the force which can be put on the coming season. The run this summer has been a very successful one and proves the mine one of the best in this vicinity.

Rich Rock.—We learn that very rich rock is being taken out of the California and Gold Tunnel mines. Both are owned by the same company. A sufficient depth has been attained to prove their richness beyond a doubt. The success of the company is gratifying and the richer the rock the better it will suit all around.

PLACER COUNTY.

Mining Items.—*Argus*, Oct. 24: We are gratified to be able to state that the St. Lawrence mine is looking well. Work is steadily advancing, and the prospect is of the most encouraging character. We shall not be at all surprised to hear of rich developments in this mine, at an early day. A. A. Pond & Co., fired a blast in their gravel claim at Todd's Valley on the 16th, that was probably the largest ever exploded in the county, Eighteen hundred and fifteen kegs, or forty-five thousand, three hundred and seventy-five pounds of powder were used.

In the Orleans mine work is progressing favorably. The main shaft is down 95 feet, and is in better ore than has yet been found. The east drift is still being pushed, and is now 123 ft. east of the east shaft. It has all the time been in good ore, and at the present time the rock taken out shows free gold in encouraging quantities. The Eclipse mill is pounding steadily away, and will continue to do so till the end of the month, when it will clean up. From the amount of quicksilver used, it is judged the clean-up will be a good one.

Greene Mine.—It is claimed by those who know something of the inside of this mine, that the reasons which caused work to be suspended for a while were not that it did not contain plenty of paying ore.

Booth Mine.—The ledge holds its own in thickness, and the rock, both at the bottom of the shaft, and at the end of the east drift, continues to show an abundance of free gold, altogether indicating very high grade ore. The company have just made a contract with the proprietors of the Eclipse mill to crush 600 tons of rock, from which it is reasonable to anticipate flattering returns.

Crater Mine.—Work at the Crater mine is progressing with considerable earnestness. The prospects are rather encouraging. At the bottom of No. 2 shaft, 150 ft. deep, and which they are still sinking, they have a ledge about 15 in. thick, that pays $25 to the ton. They are also extending the east drift from shaft No. 1, on the 312-ft. level, with good prospects as they go. While this work of sinking No. 2 shaft, and extending the drift on the 312-ft. level is going on, another force is at work stoping out the ore between the 150-ft. level and the 100-ft. level, in order that the mill may be kept in motion. The rock now being taken out from between the last named levels is paying from $21 to $25 per ton.

Nevada.

WASHOE DISTRICT.

Ophir.—Gold Hill *News*, Oct. 22: The ore in the stopes of the west ore body, at the bottom of the winze, 85 ft. below the 1,300-ft. level, continues of the usual fine character. The north winze from east cross-cut No. 2 is down 95 ft., the entire distance in the finest quality of ore. On the 1,465-ft. level the east cross-cut, No. 3, 50 ft. north of the California line, is in 95 feet, with almost the entire face of the drift in rich ore. This is without a doubt a continuation of the rich ore body found in the north winze from the 1,300-ft. level; also the rich body of ore struck in east cross-cut No. 2, 180 ft. further north. A winze has been started 40 ft. from the mouth of this cross-cut, and is down 15 ft., the bottom in ore that assays from $70 to $200 per ton. The rich ore body in east cross-cut No. 2, is being opened out for breasting operations, and looks better every day. It is now breasted out for 30 ft. in width, in ore assaying from $300 to $700 per ton. A northeast drift has been started from this main east cross-cut, which is in 35 ft., the face still in ore of a fine character. There is no longer the least doubt of the great extent and richness of the ore developments of the Ophir, the resumption of its payment of dividends now being only a matter of time.

Consolidated Virginia.—Daily yield, 300 tons of ore. The north drift on the 1,300-ft. level is still pushed ahead, the face in fine ore. The ore breasts on both the 1,300 and 1,400-ft. levels are advancing steadily to the northward, both in ore that mills from $70 to $100 per ton. The several cross-cuts are all still in fine ore, with the exception of the north cross-cut, on the California line, which has about 60 ft. yet to run to reach the ore body. The north drift on the 1,500-ft. level of the Gould & Curry, which penetrates the ledge 38 ft. below the 1,500-ft. station of the shaft, has been driven through the ore body, a distance of 110 ft., the average assaye of the car samples ranging from $150 to $250 per ton. The body of ore in this drift is the richest on the Comstock, and its width and extent is yet entirely undetermined, as no cross-cutting from that drift has yet been done. A second winze 100 ft. south of the connecting winze between the Gould & Curry and Consolidated Virginia, has just been completed, passing the entire distance through rich ore.

Belcher.—During the past week there has been considerable increase in the amount of ore extracted from this mine. The largest day's work was that of day before yesterday, amounting to 700 tons. All of the mills employed in crushing Belcher ore are being run up to their full capacity, the Enreka mill alone working 185 tons per day. Yesterday the company's hoisting works were shut down for the purpose of making some repairs, which will be completed to-day. The new air shaft is down to the 1,000-ft. level, and its beneficial effects as regards ventilation are felt even down on the lower levels of the mine. The miners are able to work on the 1,300 and 1,400 ft. levels, without any particular discomfort from the heat. The mine is looking well in every part.

Sierra Nevada.—Sinking the main shaft is again progressing finely, the bottom having passed through the soft clay body, recently encountered, into a firmer and much more favorable character of rock for sinking. The flow of water from the bottom still continues quite strong, although showing a marked decrease in quantity. The pump handles the water with the utmost ease. The north drift from the Sierra Nevada tunnel passed through the body of white quartz and ore recently discovered, at a distance of 40 ft. from where it was struck, and is now being pushed ahead to make the connection with the old works as first intended. Another prospecting drift has just been started from this tunnel to cut and prospect a southwest body of red quartz and ore discovered during the early prospectings of the old Sierra Nevada shaft. Daily yield, 65 tons of ore, keeping the mill steadily running.

California.—The drifts from the Consolidated Virginia and the Ophir on the 1,400 ft. level have been connected, giving a fine ventilation of the mine to that depth. The drifts from the Ophir and Consolidated Virginia on the 1,500-ft. level are so nearly connected that the men can very distinctly hear each other at work, and it will now be but a very short time until the two are connected. As soon as the connection of these drifts are completed, cross-cutting the 1,300, 1,400 and 1,500-ft. levels will be commenced. A drift has been extended 80 ft. from the south line of the Ophir into the ore body, on the 1,465-ft. level, which is of the finest possible character, the last 20 ft. being in ore that will mill $100 per ton.

Julia.—The shaft is now as fine a working shaft as there is on the Comstock lode, and when the new pumps are once in good running order, the development of the mine will be prosecuted with all the vigor possible.

Gould & Curry.—Cross-cutting northward at the fourth station level shows a fine, extensive body of quartz, but no ore that will pay for extracting. Sinking the north winze from the 1,500 to the 1,700 ft. level is making good progress. It is now down 90 ft. An air pipe is being carried from the compressor to this winze for the purpose of driving a small engine to do the hoisting.

Crown Point.—Daily yield, 550 loos of ore. The ore breasts are looking well and yielding finely on all the different levels. The ore stopes just being opened on the 1,500-ft. level are opening out splendidly, and promise a rich yield The face of the main south drift on the 1,500-ft. level is in rich ore. The mills are all running up to their full working capacity, and good returns for the month may be looked for.

Hale & Norcross.—The main incline is down 25 ft. below the 2,100-ft. level, the bottom in rock of extreme hardness. Opening the 2,100-ft. level is making good headway. The main south drift on the 2,000-ft. level is in 90 ft., the face in porphyry.

Woodville.—The ore stopes on the 200-ft. level are still yielding finely, as are also the stopes on the 300-ft. level. The ore vein below the 300-ft. level is 15 to 20 ft. in width, with 5 to 6 ft. of rich ore. The machinery, for an addition of 10 stamps to the mill, is on the ground and will be erected at the earliest day possible.

Dayton.—The ore breasts north, on the second station level, are showing much improvement in the quality of the ore extracted.

Imperial-Empire.—The main east drift on the 2,000-ft. level is being pushed with all the energy possible, to cut and prospect the ledge. Sinking the north winze on the 1,850-ft. level is making good progress, the bottom still in fine ore. The bottom of the south winze on the 1,850-ft. level is also in rich ore. The ore in the face of the main south drift on the 1,850-ft. level is still of a fine character, though slightly broken up.

Utah.—Prospecting the 400-ft. level both north and south is still vigorously prosecuted in the hope of yet finding pay ore.

Sutro.—The main west tunnel has entered a heavy clay wall, and has passed into a body of ledge material of a compact formation, carrying some quartz and almost perfectly dry, there being no water whatever to impede the steady progress of the work.

New York.—The streak of ore in the north drift from the main west tunnel on the 560-ft. level still continues of a good quality.

Globe Consolidated.—The ore in the face of the main west drift at the 400-ft. level is showing considerable improvement. The ore body struck a short time since in the north drift from the main west tunnel is opening out finely. It is now 15 feet in width, and appears to be widening out to the northward.

Bullion.—The main north drift from the 1,700-ft. station of the Imperial is driven vigorously ahead, the quartz in the face showing a steady improvement during the week.

Senator.—The main west drift on the 400-ft. level yesterday encountered some fine ore prospects, the assay ranging from $15 to $30 per ton.

Overman.—Sinking the main shaft is making steady headway. The face of the north drift, on the 1,200-ft. level, is still in ore of a fine quality.

Lady Washington.—Considerable water has been encountered in the bottom of this shaft during the week, which impedes the progress of the sinking.

Challar-Potosi.—About 70 tons of ore per day is being extracted from the old workings, the assay value of which is $30 per ton.

Caledonia.—Opening out the new station 77 ft. below the 1,000-ft. level.

Yellow Jacket.—Drifting both north and south on the 1,740-ft. level is making good progress without any change to report.

Dardanelles.—The new shaft is down 140 ft., at which depth a strong flow of water was encountered. Finding the flow of water too strong to be handled until the new machinery was in running order, the sinking was stopped and a station opened for the purpose of drifting to the ledge.

Genessee No. 2.—Sinking the main shaft as usual.

Justice.—This mine is once more in full work, with everything going ahead as before the recent trouble.

Kossuth.—Sinking the main shaft is making splendid headway, the rock in the bottom blasting out finely. The east cross-cut, from the main south drift on the 200-ft. level, during the week cut through a fine body of ore, 10 ft. thick, lying directly against the east wall of the ledge.

Knickerbocker.—A station has just been opened at the 700-ft. level, and in two or three days more a drift will also be started from that station for the ledge.

Leo.—There is no particular change to report of the ore producing sections of the mine. The timbers are being put in preparatory to commence raising up on the main shaft.

Nevada.—The ledge in the lower tunnel shows continued improvement as the tunnel is driven ahead, giving excellent assays which show that milling ore is close at hand.

Savage.—Sinking the main incline is making the usual good progress.

Silver Hill.—Prospecting at the second and third station levels is being vigorously prosecuted both north and south.

Rock Island.—Draining the water from the 200-ft. level is being prosecuted with all the vigor possible. The flow of water is gradually decreasing.

Mint.—Sinking the shaft is still progressing finely.

Buckeye.—Sufficient ore is being extracted to keep the Hope mill running.

Baltimore Consolidated.—Cross-cutting on both the 450 and 750-ft. levels is being vigorously prosecuted.

Iowa.—The prospecting tunnel west is still driven vigorously ahead.

Union Consolidated.—The east cross-cuts on the 1,300-ft. level are looking much more favorable.

East Belcher.—The new working shaft, with its three compartments, is being sunk at a very energetic rate, with excellent prospects.

Florida.—The main shaft has attained a depth of 347 ft.

Sutro Tunnel.—The header is now in 7,600 ft. The daily rate of progress is 12 ft. in good working ground which does not require timbering.

It is estimated that there are three hundred men engaged in active mining pursuits in Napa county.

Last month 3,450,000 pounds of bullion was forwarded over the Utah Central road.

Quicksilver prospectors are still locating in the coast range of Stanislaus county.

Newark Mining District.

A recent visit to this locality, says the *White Pine News*, has convinced us that a bright future is in store for this really meritorious district. Upon the advice of Mr. Stratton, superintendent of the works and mines, Mr. A. Long, one of the directors of the company, and a large, owner therein, is at present making a visit to the property. In conversation with him we ascertained that the company still have perfect faith in the richness and permanency of the mines, and are prepared to advance money to properly develop the same. A smelting furnace of 40 tons' capacity is now being erected at the town of Newark, and will soon be ready to start up on ores from the mines situated on Diamond Mountain, but a short distance from the site of the furnace. Mr. Bassett, of Eureka furnace notoriety, is the builder, and having procured the lining stone from the Pancake stone quarry, no doubt can be had that the venture will prove eminently successful. The Dictator mine, one of the leading ones of this district, is now being worked under contract by several miners, and has recently shown a large and rich deposit of ore, which assays show, goes as high as $200 and $225 per ton. The body of ore referred to now shows a width of three feet, with every indication of widening as depth is attained. Much feeling is expressed by the miners in relation to an item appearing in a late number of the Eureka *Sentinel*, in which it is stated that the ore contains much copper. The contrary is the case—no trace of copper is to be found—in fact the ore is of a free milling character. The Diamond mine is also looking remarkably well, showing quantities of free milling ores, which are being rapidly extracted and placed on the dump ready for transportation to the furnaces. The Battery mine is also being successfully worked, and producing large quantities of pay ore. Many other locations are showing well, and all bid fair to become leading properties. The feeling among managers and employees seems to be one of great unanimity of hopeful sentiment in the future of Newark district, one in which we most heartily share. When the new furnace is finished and a start made, we are of the opinion that our oft repeated theory of the success of smelting as against milling for this district will be fully realized. At Newark, we met our old friend Gus Gould, of Austin, who, we are informed, will be retained at Newark in the employ of the company. Gus has been enough among miners and miners to know all about the management of them, and his presence there presents another argument in favor of the eventual success of this district. For years the management has been of the worst order, and only persistent and well directed efforts by the present powers that be can bring back the faded glories of this mineral-bearing district. The district is also noted for its extensive ranching interests and stock grazing facilities. Down the road to Cold creek, a distance of some twenty miles, we find some of the finest ranches to be met in the country. Frank Beachman and McMinniman, have both large tracts of fine land under cultivation, and each the possessors of a large number of cattle. We were so sadly pressed for time on our last visit that we found it impossible to visit Cold creek, where are located many other fine ranches. Newark district as a mining location, and Newark valley, as a farming country, is, we believe, unsurpassed in Eastern Nevada.

VALUE OF BIRD'S-EYE MAPLE.—The Green Bay *Advocate* says: "The machine of S. C. Carpenter and Dr. M. E. William, for cutting veneering, which we have previously described is an undoubted success. It does its work smoothly and well. It is a knife shaped like a pencil-sharpener and commences cutting at the end of the log, the log feeding into the knife or the knife to the log, on a common lathe, the veneering coming off in the shape of a scroll. There is a machine for cutting veneering from round blocks, but it is different from this. In that the knife is parellel with the log, and in some kinds of wood the beauty of the grain is lost, while with the knife set at an angle it is preserved. A few words will give an idea of the profit of using a machine like this. A bird's-eye maple log scaling 1,000 ft can be put down at the manufactory for $6 to $8. The machine cuts the veneering one twenty-fourth of an inch thick, and the log would therefore cut about 24,000 ft. Two men, it is thought, could cut the log in half a day. At one cent per foot the veneering would be worth about $240. But this veneering is now worth six cents per ft, or $1,540 for the log."

Cocoa Nut Palms.

The Oriental scene represented on this page shows a group of cocoa-nut trees. These trees are found all over the tropical regions; but generally growing within reach of the sea or salt water, and often taking root on sandbanks or thinly covered reefs almost directly after they appear above high water. The tree rises from 60 to 90 feet in hight and affords food, drink, oil, clothing and shelter to the natives. It has a soft fibrous stem marked out its bark by rings. In hot climates every part of the tree is made use of. The natives chew the root as a substitute for the areca; the stems are used as uprights and supports for houses, and for making many domestic implements; the leaves form a thatch or are made into umbrellas, baskets, buckets and lanterns; their ashes yield potash in abundance. The fibrs from the nut is woven into cloth, ropes, mats, sacking, etc. From the juice of the stem is obtained an oil, also a coarse sugar, and by distillation a kind of an ardent spirit; while the pith, dried, ground and washed forms a farinaceous food similar to sago. The fruit itself is a wholesome food and its milk a cooling beverage and forms the chief aliment of many of the natives. The fibre of the shell is used for brushes; the shell is turned and polished into drinking cups and measures, while the substance of the nut itself when pressed, yields a large quantity of oil which is used for many purposes. The unexpended buds of the tree form, when boiled, a delicate and much esteemed food.

GROUP OF PALM TREES.

A. E. HALLENBACK writes as follows to the N. Y. *Sun*, from Canandagua, Mich., Oct. 5th: On Thursday, October 1st, while scraping out the county ditch on his farm in Seneca township, Lenawee county, Michigan, Oramou Tuttle came in contact with an obstruction that overturned his scraper. On examination it proved to be an immense horn, the remains of some extinct animal. Further digging has developed the other horn, part of the skull, collar-bones, and a number of ribs; also one tooth. The water running back into the pit has put a temporary stop to the digging, but it will be resumed this morning, and measures will be taken to preserve the bones. The animal had evidently died standing up.

I have just visited the spot and examined the bones and the place from which they were taken. A large number of physicians and professors of the Hillsdale and Adrian colleges pronounced them horns and not tusks. They have an outside shell and a distinct pith.

The space occupied by the skeleton is over twenty feet long, and the tip of the horns were about twenty feet apart. The ends of each are decayed, but they now measure eight feet nine inches in length, and must have measured about ten feet when whole. Three feet from the large end they are twenty-two and a half inches in circumference, and they weigh 175 pounds each. Some of the ribs were seven feet long. The tooth secured is a frontal tooth, three inches square and weighs four and a half pounds. They have been viewed by several thousand people, many of whom have seen the tusks of the mastadon, which are quite common in this State, and all those agree that they bear no resemblance to them.

The animal's horns must have measured twenty feet across. His hight was probably about fifteen feet, and length, independent of horns, nearly twenty. The above statement is perfectly reliable. There is no canard about it, and, if you think proper, you are free to publish it.

The Coloration of Metals.

It is possible to color metals rapidly and at very little expense by means of covering their surface with a film of sulphurous solution. In some minutes, by means of this composition, any objects in brass or gun-metal can be given a tint of gold, of copper, of carmine, of maroon, of bright aniline blue, a paler blue, and finally a pinky white, according to the thickness of the film, which, again, depends upon the time during which the metal is plunged into the solution. The colors thus obtained have a beautiful luster, and if the objects have first been subjected to the action of acids or of alkalies, the colors adhere so intimately to the surface of the articles that they will resist the action of the tools used to polish them.

To prepare the solution, 42·5 grammes of hyposulphite of soda is mixed with 450 grammes of water; to this must be added 45·5 grammes of acetate of lead, dissolved in 225 grammes of water. In rising this solution to a temperature of 190 deg. to 200 deg. Fah., it is decomposed, and the sulphide of lead is precipitated in the form of black flakes. If the metal is present, a portion of the sulphide of lead is deposited out it, and the colors, as we have before described are produced according to the thickness of the deposit. In order that they should be uniform it is necessary to heat the objects equally throughout. Iron thus treated takes a steel blue; zinc takes a brown color.

If in the place of acetate of lead an equal quantity of sulphuric acid is added to the hyposulphite of soda, and the operation is carried on in the same manner, but at a slightly higher temperature, gun-metal or bronze becomes a beautiful red, then green, and finally an irradiated tint of green and red, striking and beautiful. This last color deserves remark from the fact that it is durable, which is not the case with all the other colors.

It is possible to obtain most beautiful imitations of marble by means of a plumbic solution thickened by adragant (tragacanth) gum applied to bronze previously heated to 210 Fah. It is treated finally with the ordinary solution of sulphide of lead. This solution will serve for many operations.—*Iron.*

SUBMARINE PHOTOGRAPHY.—Dr. Neubmeyer's plan of a photographic apparatus, designed for the determination of the temperature and currents at the bottom of the sea, is described as follows: "A copper box hermetically sealed is provided with an exterior appendix made like a rudder. A mercurial thermometer and a compass are in the interior, each in a glass receptacle, into which are admitted traces of nitrogen gas. A small electrical battery completes the contrivance. When the apparatus is lowered into the sea, attached to a sounding line, the action of the current on the rudder indicates the set of the flow, by the relative position of the compass-needle and rudder. The temperature is recorded by the thermometer. To fix these indications, a piece of photographic paper is suitably disposed near the glass case containing the instruments. At the proper moment, a current of electricity is established through the gas in the receptacle, causing an intense violet light, capable of acting chemically upon the paper for a sufficient length of time to allow of impressing photographically thereon the images of the compass-needle and of the mercury column. The time required for this register is said to be three minutes, after which the instrument is hoisted the paper removed, and replaced by another for a second observation.

UPWARDS of 500,000,000 eggs were imported into the United Kingdom from France last year.

Rattan.

Rattan comes from the Moluccas—principally from Singapore, Pedang, Penang, Samarang, and St. Simon's Bay. Of all the rattan collected in the East the United States consumes three-quarters of the total product, the imports amounting now to something more than 6,000,000 pounds. There are rattans and rattans, and no less than ten different grades can be found, which vary in price from two cents up to ten cents a pound. The first quality should be of a bright color, of a straw yellow, but in addition must be supple, and not sticky, a trade word, meaning dull and wanting in elasticity. It requires a great deal of experience to decide what is good rattan, or the kinds which will work up best for particular sorts of goods. The very choicest rattan comes from Bassamassing. Both outside and inside have their special uses.

The Calamus Rotang belongs to that particular species of palm which secretes in its cuticle a very considerable amount of silica, while its inside is made up of of tough and fibrous filament. The outside, with the smooth natural varnish, when stripped off by particular machinery, is used for seating chairs. There is a single factory in the United States which turns out daily enough chair cane to cover 20,000 chairs. The inside of the rattan is shaped by machinery either round or flat, and so worked up into innumerable articles. Baskets, brooms, mats, matting, are all made from the inside of the rattan, and an immense quantity of it is worked around demijohns.

Both the inside and outside of the rattan are employed in the manufacture of furniture. This branch of industry we have undoubtedly copied with Chinese accuracy from India. Perhaps even with the addition of our numerous mechanical helps we have but very little improved on the models as to the appearance or solidity. There is an exquisite comfort, a luxurious ease, about a real rattan *chaise longe*, such as is made at Singapore, that we can hardly equal. Split rattan is made up into some half dozen different sizes, and is then sold by the 1,000 feet. The finest qualities of rattan are also used by whipmakers. This large and constantly increasing business may be estimated by the fact that one factory in New England alone employs 1,000 operators, and that the total number of people working in rattan (the schoolmaster excluded) is fully 18,000. The capital used in the manufacture of rattan is about $2,000,000.

NEW NAVAL GUN CARRIAGE.—A new naval gun carriage and platform are to be experimented upon at Woolwich Arsenal. The invention is said to utilise the application of hydraulic power to such an extent that all the work of the gun detachment, with the exception of taking aim, may be dispensed with. A peculiar railway truck, adapted to the purposes of a gun carriage, is also about to be tried. Before going to the expense of making these carriages the principal was tried in a rude way with an ordinary railway truck on the ordinary rails which were level with the ground. A gun was securely fastened to the truck with chains and fired with a 500 lb. projectile and 80 lbs of gunpowder. When discharged the gun and its extempore carriage recoiled about 100 yards along the level line, and Major Maitland R. A., the Assistant Superintendent of the Royal Gun Factories, by mathematical calculations, arrived at the conclusion that by inclining the rails upwards towards the rear at a very slight gradient the recoil of the heaviest gun would be kept within reasonable bounds.

LONG BLAST.—The St. Louis *R. R. Register*, says: The longest blast of a charcoal furnace yet announced is that of the Shelby Iron company's furnace at Shelby, Alabama. It has now been working continuously for three years and seven months, and has made an average of 100 tons per week since it blew in. The greater part of the production has been an excellent iron for car wheel purposes, and its quality ranks it among our very best American irons. The ores used are limonites, yielding, when roasted, about 53 to 54 per cent. in the furnace. The consumption of charcoal has been 130 bushels (of 18½ lb.) per ton of pig iron produced. The lining of the furnace is of fire brick, made at the works from clay found in the neighborhood. The manager, under whose excellent administration these works have been so successful, both financially and metallurgically, is Mr. Walter Crafts.

Good Health.

Importance of Wholesome Beds.

Sleep to the working man is emphatically Nature's restorer—rsinvigorating the physical system, whioh through mnch toil has beoome weary, and keeping up the flow of life and apirits whioh are necessary to the performance of the arduous duty of farm-life. A comfortable bed, as we are all awars. conduces greatly to one's rest. On this subject a recent writer says:

Of the eight pounds whioh a man eats and drinks each dav, it is thoaght that not lese than five poands leaves his body through the skin.

And of these five ponnds considerable percentage escapes during the night while he is in bed. The largest portion of this is water, but in addition there is much *effete* and poisonous matter. This being in great part gaseous in form, permeates every part of the bed, mattress, blankets, as well as sheets, which soon become foal and need purification.

The mattress needs the renovation qnite as much as the sheets. To allow the sheets to be nsed, without washing or changing, three or six months would be regarded as bad honse keeping; bnt I insist if a thin sheet can absorb enough of the excretion of the body to make it nnfit for nse in a few days, a thick mattress, which can absorb and retain a thonsand times as much of these poisonous excretions, needs to be purified as often, certainly as once in three months.

A sheet can be washed. A mattress cannot be renovated in this way. Indeed, there is no way of cleansing a mattress but by steaming it or by picking it to pieces, and thns, in fragments, exposing it to the rays of the snn. As these processes are scarcely practicable, with any of the ordinary mattresses, I decidedly am of the opinion that the good old-fashioned straw bed, which can every three months be changed for fresh straw, and the tick be washed, is the sweetest and healthiest of beds.

If, in the winter season, the porousness of the straw beds makes it a little nncomfortable, spread over it a comforter or two woolen blankets, which shonld be washed as often as every two weeks. With this arrangement, if you wash all the bed coverings as often as once in two weeks, you will have a delightful, healthy bed.

Now, if yon leave the bed to air, with open window during the day, and not make np for the night before evening, yon will have added greatly to the sweetness of yonr rest, and, in consequence, to the tone of your health.

I heartily wish the change could be everywhere introduced. Only those who have thns attended to this important matter can judge of the influence on the gentle health and spirits.—*Maine Farmer.*

Paralysis.—Paralysis is becoming a prime disease. It is not confined to the fleshy, the plethoric, nor to the aged. The fast life of our business young men tells on them. It is a very common thing to see men of 30 and 35, bald headed, feeble-gaited, and walking about with canes, their nnderpining knocked out, with other signs of premature age. These sigos of early weakness develop in paralysie. Sudden deaths from this cause are very common. Several have occnrred in railroad trains, the vibration seeming to predispose persons to the disease. Not long since a gentleman died in one of our churches. He was interested in a case of discipline. He made a report to the church on the case, sat down, laid his head on the back of the seat, and instantly expired. In another case a man not accustomed to pnblic speaking arose to relate his religious experience He was so excited that he could scarcely speak. In the midst of his remarks he was seized with paralysis, and carried to his home. Our young men will have to tone down their style of living if they want to amonnt to anything.

The Neck.—Perfect health demands that the clothing about the neck should be very moderate in quantity, and worn so loose as to prevent the slightest compression. The great error frequently committed in clothing this part of the body consists in wearing snch an amount as to overheat and weaken the throat, and thns render it easily snsceptible to cold, or in wearing it so tight as to retard the circulation of the blood to and from the head. Great care shonld be exercised upon this point, as the arteries and veins leading from the heart to the brain are situated so near the surface in the neck that a slight compression there serves to check the flow of the blood. Many cases of congestion of the brain and headache are caused by too tight collars and cravats.

No Appetite for Breakfast.—No judicious parent would let a child go to school without breakfast. If there is a habitnal lack of appetite in the morning, there is snrely some difficulty behind it, and it will inevitably lead to greater difficulties in the future. No breakfast means a lunch in the forenoon, a lunch means no appetite for dinner, a little dinner means a heerty snpper and no appetite next morning. Insist on a light supper, early rest at night, and allow no studies and no excursion to proceed, unless some food can be taken. The habit will soon be formed, or there is some serious disorder, which needs the co-operation of some good physician.

Washing the Inside of the Body.

There is no cavity in the body which water is not fitted for if you get it in properly. Why, one of the best things yon can do is to wash your blood, and the great folly we commit in going through our lives from childhood to the grave, is that we do not wash our blood as we ought. Infusions of coffee, tea, chocolate, or cocoa, or cider, or beer, do not wash the blood, because with the fluid so taken in, something is carried in also which befouls and defiles the blood. Just let a man say to himself, "It is Saturday night, I have worked hard all the week, and Sunday shall be a day of rest to me. I am now going to give my whole system between this and Monday morning a good thorough washing," So he begins to drink, and drink, and drinks but little at a time, yet between Saturday night and next Monday morning a healthy man can drink without producing any disturbance a gallon of water. Now let this come into and go through his circulation—through his lungs, and skin, and kidneys, and bowels, and waste materials are carried out—and when Monday morning comes, if he jumps out of bed and gives his external skin a good washing, the water that he washes in will be foul. Or if he prefers to test that question even more thoroughly, all he has to do is to take a clean sheet, and then wetting it in good, soft, pure water, be wrapped up in it for forty-eight or sixty minutes, and then have the sheet washed in a tub of water, and it will color that water so it will look dirty. The man has been washed inside—his blood has been washed. When you have washed his blood, tissues, bones, nerve, muscle, sinew, membrane and brain, and everything in him, he can defy all pestilence for that week. The washing of a person's ouside is twice as necessary as the washing of a person's clothes, and yet there are those who are very particular to have their clothes washed with great care, who are not at all particular to wash themselves.

Paragraphs Worth Remembering.—Benzine and common clay will clean marble.

Caster oil is an excellent thing to soften leather.

Lemon juice and glycerine will remove tan and freckles, and will cleanse and soften the hands.

A dose of caster oil will aid you in removing pimples.

Spirits of ammonia, diluted a little, will cleanse the hair very thoroughly.

Useful Information.

Protection of Wood Joists.

Mr. James John, architect, of Chicago, has given a public test of his newly invented method of protecting wood against fire by wire lathing and plaster. A paper of that city speaks as follows:

"Mr. James John gave a public and very thorough test of his new patent concrete filling for the protection of a wood joist and ceiling against fire. A brick building 12 1-2 feet square and 11 feet high, with two windows and a door, and two floors of wood joist, was erected in the vacant lot opposite the City Hall, the joist of both floors being filled with the fire-proof concrete. The entire space inside was then filled with combustible material and set on fire. The fire burned over an hour and a half, reaching a degree of intense heat; but neither of the floors were injured. It is claimed by Mr. John, and this severe test goes to demonstrate it, that brick buildings with ordinary wood joist in the floors, if protected in this manner, will resist the progress of fire even better than buildings erected with iron beams. The fire cannot, it is claimed, communicate from one floor to the other, and the joists remaining in their places, the walls will be left standing. Iron beams, when subjected to intense heat, expand or sag, often bringing the walls down with them; but the concrete filling is said to be absolntely impenetrable and immovable by fire or heat. The cost of such a structore is said to be about half that of iron beams, while the experts present gave their full approval to this style of straoture."

Lime Deposits in Water Pipes.—It has been pointed out by M. M. Fabre and Roche, with reference to deposits of lime in lead water pipes, that wherever there is a joint in the pipes made to connect tin conductors or copper faucets, at such points carbonate of lime is most abundantly deposited. If a piece of silver be placed inside in contact with the lead pipe it will become covered with the carbonate in a very short time. The investigators find that all metals, electro-negative with relation to lead, are thus affected. A voltaic couple is in fact formed, and a veritable chemical precipitation caused.

Wet boots, says an authority on the subject, should not be dried by the fire, as this is a mistake. When the boots are taken off fill them quite full of dry oats. This grain has great fondness for damp, and will rapidly absorb every vestage of it from wet leather. As it takes up the moisture it swells and fills up the boot like a tightly fitting last, keeping its form good, and dries the leather without hardening it. In the morning shake out the oats and hang them in a bag near the fire to dry, ready for the next wet through.

Origin of the Circular Saw.

The origin of the circular saw—an invention which might justly be compared to the locomotive and the telegraph in its importance to mankind—has been of late the subject of considerable discussion, in our own columns and elsewhere. We have an interesting communication on this topic from Mr. S. C. Barton, of Peterson, Minn., who writes: "In a recent issue, under the head 'The Invention of the Circular Saw,' you remark 'the credit of this invention has been given in some quarters to a citizen of Vermont, now deceased.' I think this refers to Wm. Kendall, late of Fairfield, Maine. He died, I think, within the past year. As long ago as I can well remember—perhaps about the year 1825—he built a circular saw mill at Waterville, Maine. His first saw was seven feet in diameter, built of plates of iron, riveted together at right angles, being made thin at the outer edge, but about six inches thick in the middle, where it fitted the arbor. It was made plain on one side and conical on the other, so that the board had to be sprung from the saw as it was cut. It could therefore only be used in cutting thin stuff. The teeth were fitted to the outer edge of the saw, something as the saw-manufacturer, Emerson, now fits teeth. To steady the saw, he built a powerful force pump to throw a very small jet of water on the opposite sides of the saw. He afterwards either rebuilt or enlarged his saw to nine feet diameter. It was driven with a wheel of his own invention with a half cross belt from a drum on the upright shaft. It was not a success. He was a noted water wheel man as well. He took out a patent on his wheel and made considerable money from it; but I think he did not save much. If I am wrong regarding the date of his invention, some of the older citizens of Waterville can put me right."—*Liffel News.*

Adjusting the Harness to the Horse.—Every part of a harness should be buckled up shorter or let out until the harness fits the horse as nearly as a pair of boots that are of the proper size for one's feet. The collar should fit closely, with space enough at the bottom to admit a man's hand. If too large it has the bad effect of drawing the shoulders together. On no consideration should a team or any work horse be compelled to wear a martingale, as it draws the head down and prevents him from getting into an easy and natural position. The check rein may be used, but only tight enough to keep the head in a natural position, and should never be wound around the hames. See that the hames are buckled tight enough at the top to bring the draft irons at the proper point on the side of the collar. If too low, it not only interferes with the action of the shoulders, but gives the collar an uneven bearing. Caution should be taken that the girth is not buckled too tight, particularly on string teams, for when the traces are straightened it has the tendency to draw the girth against the belly and distress the horse.

Cleaning Bottles.—Many persons clean bottles by putting in some small shot and shaking them around. Water dissolves lead to a certain extent, and a film of this lead attaches itself to the side of the bottle so closely that the shaking or rinsing with water does not detach it, and it remains to be dissolved by any liquid with the least sourness in it, and if drank lead poison may be the result; sometimes a shot becomes wedged in at the bottom of the bottle, to be dissolved by wine or cider. Therefore it is better to wash every bottle, as soon as emptied, with warm water and wood ashes, or saleratus, and put the bottles away, mouth open and downward; but be careful to wash again when used, as flies and other insects frequently get into bottles. Clippings of iron wire are a better means of rinsing. They are easily had and the cleaning is rapid and complete. The iron is attacked by the oxyen of the air, but the ferruginous compound does not attach to the sides of the bottle, and is easily removed in washing, besides a little oxidized iron is not injurious to health. It has been found that the slight traces of iron left have no apparent effect on the color of red wines; it has on white wines but very little, and it might be better to use clippings of tin for the latter.

To Make Good Casting.—The carelessness that produces rough castings is most inexcusable. Well mixed facing and care in moulding is the whole of the secret of having clean castings with a fine blnish surface. The foreman who constantly produces casting that require pick hammering to free them of sand that has burned itself to the metal, does not understand a most important feature of his trade. The roughest of all work is rough castings; and yet the remedy is simple—care in moulding and good facing constituts the whole of it—large work as well as small can be made nice and smooth in green sand by attention to these two things, and the amount of after labor that can be saved is no inconsidereble matter. No man is worthy to be a foreman who does not appreciate all that can be done in the way of good foundry work by attention to care in moulding and well mixed facing.—*American Manufacturer.*

Thickness of the Walls of Iron Clads.—The heaviest armor yet attached to the turret of any iron clad in European waters is 14 inches. The thickest American iron clad turret is 15 inches. The Steven's Battery now nearly finished in New Jersey, and belonging to that State is to have a turret with walls of iron from 16 to 18 inches in thickness.

Domestic Economy.

Cooking Eggs.

Eggs bear a relation to other animal food similar to that which seeds bear to other vegetable food. They are the depositories of vitality, stored up to form a new link in the continuation of the species. They are probably the purest form of animal food, though they compare unfavorably with seeds in many respects. They lose their vitality sooner, and they partake more or less of whatever impurities may have belonged to the animal that produced them. They are not so nutritious as some of the seeds, and they require more care in cooking.

Like seeds, one of their principal ingredients is albumen, which is nearly pure in the white; but, unlike vegetable albumen, it coagulates with heat; if the heat is great, becomes so hard as to be extremely difficult of digestion. Hence eggs are more easily digested raw than cooked, and hence also the objection to hard boiling. Dr. Beanmont found bits of hard-boiled egg-white, no larger than a pea, sometimes remained in the stomach after everything else had yielded to the action of the gastric juice. Snch logic is unanswerable. He deduced from it the importance of careful mastication. We women can go a step further and find in it an intelligent reason for so cooking the eggs that they will not require this extra care. Fried eggs are still worse than those which are boiled, both because snbjected to a greater degree of heat, and because of cooking fat into them.

Even in the common method of boiling them rapidly in "three and a half minutes" the albumen next the shell is quite too hard. It should be uniform and custard-like, and this is secured by the method, now becoming quite common, of merely letting the eggs stand from seven to ten minutes in hot water. This should be boiling hot at first, but the cool eggs reduces its temperature somewhat. The exact time required will vary with the relative proportions of eggs, and water with the size of the eggs, with the heat and thickness of the utensil used, with the warmth of the place where it stands, and with the weather also, a little more time being required in dull weather. The cook will soon learn what allowance to make for her utensils; and for the rest she must use her judgment every time. They are not so easily spoiled however, as in boiling. If left in a little too long they can be plunged in cold water for a minute or two. If kept hot until the yolks stiffen, the yolks will not be hard. The yolk should be cooked just enough not to break rapidly when turned out. These are properly speaking, not "boiled eggs," but "curdled eggs."

These curdled eggs make an admirable dressing for many breakfasts dishes—boiled samp, oatmeal mush, cracked wheat, and especially for small hominy. The gentle method of cooking egg may also be observed in making egg-toast. Have the milk almost boiling, in a flat dish, and break in the eggs one by one, cooking a few at a time, and being careful not to let them run together. Sprinkle in a little salt, and let them stand hot and covered until firm enough to take up without breaking. Then have ready some split better biscuit (gems), softened in hot milk and laid on a platter, and when the eggs are done dish them one on each half of a biscuit and serve warm. This is a handsome dish, and though not quite so digestable as hominy dressed with eggs curdled in the shell, it is still far better than fried potatoes and griddle cakes that form the staple of so many breakfasts.—*Science of Health.*

Bread Muffins.—Take four slices of baker's bread, and cut off all the crust. Lay them in a pan and pour boiling water over them; but barely enough to soak them well. Cover the bread, and after it has stood an hour, draw off the water, and stir the soaked bread till it is a smooth mass; then mix in two tablespoonsful of sifted flour, and a half-pint of milk. Having beaten two eggs very light, stir them gradually into the mixture. Grease some muffin-rings; set them on a hot griddle, and pour into each a portion of the mixture. Bake them brown; send them to the table hot; pull them open with your fingers, and spread on butter. They will be found an excellent sort of muffin, very light and nice.

Delaware Biscuit.—Take as much flour as will do and use judgment with regard to the amount of lard. Some folks like more some less. They are neither so light nor good when too greasy. But salt to the taste and rub it all together, then add cold water slowly and as little as will possibly answer. Make the dough so very stiff that you can neither knead nor beat it, with any comfort, until it is set away awhile—some twenty or thirty minutes, when it softens a little. Then beat it until it is very light, make out the biscuits and bake in a quick oven, which had better be too hot than too cold. Cover up the dough when set by to soften. They bake in fifteen or twenty minutes, if not too large, and when done they feel very light.

Spanish Puffs.—Put into a saucepan a teacupful of water, half a teaspoonful of salt, and two ounces of butter. While boiling add sufficient flour for it to leave the saucepan; stir in one by one the yolks of four eggs, drop a teaspoonful at a time into boiling lard, fry them a light brown, and pour white wine and melted butter over them.

Breaking Propeller Blades.

A cable dispatch states the Pacific Mail steamship company's new steamship, City of Peking, when one day out from New York, on her way to this city lost one of the blades of her propeller, and on the twelfth day out lost another blade. She put into Rio on the 19th inst. Otherwise, all well. She was supplied with duplicate blades, and also a coffer dam to use in replacing her blades, and she may possibly be detained there from ten to fifteen days. She left Sandy Hook on Monday, September 28th, at 8:45 A. M., and with the loss of the blades, as above stated, she made the run to Rio, 5,000 miles, in about 20 days. Mishaps of this character are now so frequent that inventors should turn their attention to the matter with a view of making some practical prevention.

The Panama steamer "Costa Rica" broke her shaft 40 miles from land, 100 miles from San Diego, October 25th, and has been towed to that port by another steamer. This is another case in point.

The cause of breakage of propellers is generally due to "racing" of the propeller, caused by coming suddenly out of the water and again plunging into it with greatly increased momentum. This is unavoidable in a sea-way, even with deeply laden vessels, though it is more apt to happen in those lightly laden. One invention was announced a short time since to remedy this, but whether it has been practically applied or not we are not informed. Trials have been made which are said to have been satisfactory. It consists of a pneumatic air chamber, which communicates with the sea through a sea-valve, and with the throttle valve of the engine, and acting somewhat after the principle of the Westinghouse air-brake on steam cars when the train is broken. This pneumatic governor is simple and instantaneous in its operation, and cuts off the steam from the engines by the transference of pressure the instant a heavy sea begins to lift the screw out of the water. The adjustment is such that when or before the propeller is raised out of the resisting medium, and before acceleration can ensue, the throttle has served its purpose and the shaft been relieved from all tension. If this device is as efficacious as claimed, it ought to do much to prevent accidents of the character spoken of above.

Street Cars.

Horse cars are a necessity in all populous cities, and only truck drivers and people who have private carriages would ever think of doing away with them. Still the passengers as well as pedestrians find considerable to grumble at about street cars, and some of this grumbling is done with a good show of reason. In the first place whenever you want to cross the street and a team is coming rapidly up splashing mud and dirt, it seems as if that inevitable car was exactly on the crossing and in your way. Whereas if you want to take the car, it has just passed or there is none in sight. We do not know that this is always the case, but our experience has shown it to be very often so. There are in this city at most crossings three rows of flags for pedestrians; and the drivers of the street cars have by long practice and experience learned how to cover exactly these three flags with the hind end of the car. This serves to block up the crossing very effectually, by which the driver shows his independence of public opinion. When there is a woman with two or three children, an umbrella and several bundles, all to be taken into the car, the faces of the pedestrians, who await her motions, are a study for a philanthropist. This annoyance could easily be prevented by the companies instructing the drivers to stop at the last flag, as the steps of the car would then be over that flag, leaving the two others for pedestrians to pass behind the car without being interrupted. There is now an order in force by which car drivers must only stop on the second crossing, so as to keep the cars off the crossstreets. If one extra flag were placed on each side of each track just off the crossing, the car could stop beside that flag and the passengers enter without stepping in the mud, while at the same time the crossing would be available. An extra row would not be needed, as one single flag for the special use of the street cars could be laid on each side of and between the tracks at each crossing. We think this suggestion will be carried out some day, as it seems eminently practicable and attended with little expense.

Everybody growls about overcrowding cars, while at the same time everybody persists in doing exactly what they themselves growl about. So part of the fault of this lies with the public as well as with the car companies. If people seem content to stand up inside or on the platforms after the seats are filled, of course we can't expect money making car companies to prevent them. The only way to obviate this, is to adopt the French system of compelling the conductor to show a sign when the car is full and to compel the passengers not to enter the car after the seats are filled. If the companies were fined as the steamship companies are when they carry an overplus of passengers, this reform might be adopted. But some system must be in vogue which will be independent of the control of the indifferent; a compulsory one in fact, as people *will* crowd everywhere.

One of the "growls" which we, individually, want to make, is the absence of ventilation in our street cars. We seldom enter one of our city cars, especially when the public is going home from its daily labor, without thinking of this matter, and wishing that some inventor who is meditating on a new washing machine or patent churn would bring his inventive faculties to bear on an improved system of ventilation for street cars. If the Spring Valley Water Co. sold water cheaper, or the waters of our bay were warmer, or James Lick's projected public bath-house were completed, this question would not obtrude itself so frequently. But it is a lamentable fact that none of these conditions are fulfilled, and that the "great unwashed" is as numerous in this city as elsewhere. And the individual "unwashed," lured by cheap fares, rides in the street car, without the slightest idea that his presence is offensive, or that his more refined neighbor is making a mental calculation as to the date of his last bath. It is sad to confess that these cases are not rare, and that the neglect of personal cleanliness in one person is allowed to inconvenience a car load of fellow mortals. The care are for rich and poor alike, of course, and they ought to be; but while cases like those spoken of above exist, the companies ought to have their cars ventilated in such a manner as to afford more comfort to the better class of passengers. To realize what we have referred to the skeptical need only enter a street car on a winter's afternoon when a crowd is going home from work.

The cars are then damp, uncomfortable, close and unwholesome, and this is so well known that many people prefer to walk in the rain instead of riding. As a means of ventilation we remember reading some time since in an Eastern journal a suggestion to the effect that by taking out the glazed sash which covers the ventilators over the doors and substituting instead one with Venetian slats inclined upward as in an ordinary blind, the cars could be ventilated. By this means the current of air would be directed upward and distributed through the car before it came in contact with the passengers. They would thus be unconscious of its admission and the opening could not be entirely closed, as is now the case. The sash or frame with the slats could be fixed or made to turn. In either case it would be impossible for people indifferent to carbonic acid gas and organic odors to exclude entirely the pure fresh air, which is so necessary to our health and comfort. This idea might easily be adopted by the car companies, as it would entail little expense. With the front and rear ventilators open there would be a constant current of air with little draught, which would keep the atmosphere purer than it is now with every crevice closed up and the car at the same time crowded with passengers.

If we wanted to grumble further we might mention the habit of conductors in a hurry of starting a car so suddenly as to cause the passenger to take a seat whether there was one left or not; that of the driver of stopping as if he had struck a rock; that of the presence of fleas, etc., in the dirty carpets or straw, on the floor; windows which were once open will not shut or when once shut will not open (Query: can't some one invent a car window which is ready to work on all occasions?); allowing very wet umbrellas in the car and not having a stand for them in each corner; but we think we have grumbled enough on one subject for a while. We feel assured, however, that we grumble not alone and that many other people will coincide with us in saying that there are many defects to be rendered in our street car system before it is perfect.

Magnetic Iron Ore in Sand.

About eight years ago it was discovered that there existed on the north coast of Labrador large quantities of magnetic iron ore in sand, but for a long time no one could be induced to seriously take in hand the working of the mineral wealth, whose existence was undoubted. It seems, however, that the time has come at last when those who, for eight years past, have vainly endeavored to find a market for this magnetic ore, which lies in such abundance on the north coast, will see their efforts crowned with success. This species of sand has been known for several years, but to Mr. Lamothe, of Montreal, belongs the honor of having contributed to their working and development. A company was formed, and forges were built at Moisie. These works have been in operation ever since. A short time was sufficient to show that magnetic sand was to be found not only at Moisie, but almost all along the north shore. The richest deposits are, however, at Matashquan, Kegashka, St. John river, Moisie and St. Marguerite. Other deposits are also found elsewhere, but not of such considerable importance. Several experiments have been made to purify this sand in a rapid and economical manner, and to make steel by the direct process. According to *Iron*, both these problems have been solved. The secret of purifying we owe to Prof. Larne, of the Laval University, and the other we owe to Mr. Lahreche Kiger (now deceased), of Montreal.

The black sand deposits of the Pacific coast are known to be large, and if the method employed spoken of above is as practical as claimed, we ought to utilize our deposits. It might not pay to concentrate for the iron alone, but where our miners on the northern coast concentrate this sand for gold, they might save the concentrated iron sand for future use. It might either be shipped or worked here. Of course, at present, the concentrated sand is thrown away as useless, but it ought to be stored away for future use.

Two young gentlemen from Quebec, having great hopes in this new industry, have, according to *Iron*, induced some English manufacturers at Swansea to buy this black sand when prepared. They began in June to put up the necessary houses at a place called Black Point, between St. John's river and Mingan, and 23 men have ever since been constantly employed in preparing the sand, which contains in a rough state 30 per cent., and when prepared 99 per cent. of magnetic iron ore. These men prepared ten tons of it per day last summer, but arrangements are being made by which 30 tons per day can be prepared.

The experiments already tried for the fabrication of steel, and the quality produced, give sufficient security to rely on the success of this undertaking. Quebec has established a factory for the fabrication of steel from this sand, and Messrs. Duval and Michand have already sent up several tons of the ore to that city. At Matashquan, also, an establishment is being put up. The richness of the ore discovered in Labrador excels the similar deposit at Taranaki in New Zealand; and there is a probability that the industry thus developed will rapidly extend and become an important item in the commerce of the province. If these people can make a success of it, now is the chance for some of the people on this coast to reap a harvest also. Our deposits are extensive and claimed to be very rich, but they have never been utilized as yet.

THE proposed tunnel under the channel between France and England is thirty miles long—about twenty miles under the water and five miles on each side, of gradual approach. The long approach is made necessary by the great depth of the tunnel, which will be 200 feet under the bottom of the channel.

A New Antiseptic—Salicylic Acid.

Hitherto salicylic acid has possessed only theoretical interest on account of the occurrence of its methyl ether in wintergreen oil, and because of its close relation to the phenols and benzoic acid. But Professor Kolbe has shown a possibility of its extensive practical application and has at the same time discovered a method of making it cheaply in large quantities. He says: "After many months' trial, I have at last succeeded in gaining the clue which has led me to the discovery of a new, simple, and productive method of making salicylic acid. In dissolving sodium in hot phenol in the presence of a stream of carbonic acid there is always found, besides sodic salicylate, more or less sodic carbonate and phenylate. And I observed that the more of the former salt there was, the less was found of the two latter. I further observed that a product rich in sodic phenylate and relatively poor in sodic salicylate yielded richly of the latter salt when further heated in a stream of carbonic acid."

His attention being arrested by this fact, he began a series of experiments, which resulted in the discovery of the process which he describes as follows: "The method of manufacturing salicylic acid, upon which I finally settled and by which I have already prepared about 50 pounds, is the following: Saturate exactly commercial crude soda lye of known strength with crystallized carbolic acid previously fused, evaporated in a shallow iron vessel. The sticky, dough-like mass is now heated moderately with constant stirring, being finally powdered with a heavy pestle. This dried product is sodic phenylate. It is always a reddish yellow in color, perhaps on account of partial decomposition by the oxygen of the air during the evaporation, is very hygroscopic, and must while yet hot be bottled and kept well stopped. If the sodic phenylate is moist, or contains ether, free alkali or carbolic acid, the results are not good.

"The sodic phenylate thus prepared is heated slowly in a metal retort in an oil or air-bath. When the contents of the retort are about 100 degs. (cent.), begin to lead into the mass a moderate stream of carbonic acid. Let the temperature slowly rise, till after some hours it stands at 180 degs. After further action of the carbonic acid, phenol begins to distill over towards the last in greater abundance. Finally raise the temperature to from 220 to 250 degs. The operation is finished when at this temperature, under the continued influence of carbonic acid, no more phenol distills over.

"When the reaction is finished the residue in the retort is (if the operation has been conducted properly) a grayish white mass of sodic sodium-salicylate. The following equation represents the reaction:

$$\left.\begin{matrix}C_6H_5O\,Na\\C_6H_5O\,Na\end{matrix}\right\} + C\,O_2 = \left.\begin{matrix}H\\C_6H_3O\,O\,Na\end{matrix}\right\} O\,Na + C_6H_5O\,H$$

"The salt dissolves easily in water, to a dark brown fluid. Upon the addition of hydrochloric acid the whole forms a thick paste of salicylic acid, which contains only traces of phenol. It may be perfected by the usual methods." Curiously enough, upon repeating the experiment with potassic hydrate, not salicylic acid, but its isomer, peroxyhenzoic acid was formed.

"Knowing that salicylic acid may be easily made from phenol and carbonic acid, and on the other hand that it is decomposed into phenol and carbonic acid on heating it above its boiling point, I came to suppose that like carbolic acid it would retard or entirely prevent fermentation and putrifaction. Prof. Thiersch and myself having experimented in this direction find surprising confirmation of my conjecture."

To solutions of emygdalin, mustard, grape sugar and beer, was added a small quantity of salicylic acid, and these solutions were compared with others to which none had been added. The results were most satisfactory, fermentation being checked by the addition of a very minute quantity and completely prevented by the addition of a somewhat larger amount. In the preservation of meat, too, experiments were tried with a most satisfactory showing for this new antiseptic agent. After a month's exposure to the air the meat remained perfectly sweet, the salicylic acid with which it was impregnated being not at all disagreeable to the taste. The Professor looks to a probable practical application of that discovery by the South American meat preserving establishments. Furthermore this acid offers a substitute for carbolic acid in surgery as an application for wounds.

Prof. Thiersch reports: "Experiments thus far give good grounds for hoping that salicylic acid has all the good properties of carbolic acid and none of its drawbacks."

A WEALTHY inventor, Charles Clifton, has just died in Jersey City, leaving a fortune of $250,000. He has bequeathed all his wealth to an institution for the teaching of practical mechanics in Manchester, the cotton metropolis of Great Britain.

THE Santa Barbara stage road is being extended to Los Prietos mines.

Improved Heater for Cheese Vats.

Georgo Harris, of Petaluma, Sonoma county, California, recently applied through the Scientific Press Patent Agency for a patent on an improved heater for cheese vats and other purposes. The patent has been granted, and we herewith illustrate the invention. The principal feature is the method of distributiug the water, hoated so that it will give the same temperature at all portions of the vessel within which it is contained. For purposes of economy it is necessary to construct the vessel in which the wator is heated of some substance which is a non-conductor of heat, and within which water can also be boiled. Tho vessel is in this instance mede of wood. For the ordinary purposea of a water hoeter this vessel may be square, or with slightly tapering sides, and whou employed to heat water for a cheese vat it may he sunk below the level of the main part of the tank.

To heat the weter a metellic fire hox is constructed, made probably iu trausverse section, like an ellipae, as shown in Fig. 2. Openings are made in each end of the hox, the opening in one end being large enough for the fireplace to pass without touching the wood at all. At one end the fireplace is left its full diameter, and is provided with a flango which is securely fastenod to the outside of the water vessel, so as to be watertight; thus leaving a narrow space all around the fireplace which prevents the latter from touching the wood. At the front end the firodoor and grate aro placed. The opposite end of the fireplace may be reduced so es to form a floe, for the escape of smoke, and this flue passes through an opening at the other end, also provided with a flange, and so secured as to be watertight. By this arrangement the inventor gains all the advantages of a metallic fireplace, surrounded by water which will be quickly heated, while the containiog vessel is of such material that the heat will be retained for a long time without radiation.

In its use for a heater for cheese vats the vossel forms a part of the whole tank, as shown in Fig. 1 of the engravings. Much difficulty is experienced in keeping all parts of the vat at the same temperature, but in this device this is accomplished by the use of a wooden cover, which fits over the heater portion of the tank and extends to almost the middle of the tank. This cover rests on narrow ledges or strips, which just allow the heated water to pass ont toward the middle of the tank. The vat rests on longitudinal strips on top of this cover, and also upon the transverse strips secured to the remainder of the bottom. This bottom is in a line with the cover, so that the tank is really divided into a heating compartment and a distributing compartment.

Beneath the transverse strips are hollowed ont so that the water as it comes from beneath the cover can pass freely to the opposite end of the tank, while the longitudinal stripa offer no obstruction to its free flow to the end over the heating chamber above the cover. By this construction the inventor is enabled to produce a nniform temperature throughout the vat and at a small expenditure of fuel. When the work is finished, and the whey to be drawn off from the vat through the cock, it is desirable to cool off the vat as quickly as possible. This can be done by drawing off the hot water down to a point below the cover, by means of a cock, and then filling the space between the vat and the sides and bottom of the tank with cold water. But a small quantity of water will be needed for this cooling process, as the vat very nearly fills all the space close to the sidea and bottom of the tank; and the water around the fireplace will be hut little reduced in temperature, so that when necessary the whole can be speedily elevated to any desired temperature again.

A blast of 700 kegs of black powder was fired iu the claims of the Blue Tent Consolidated hydranlic gold mines on the 23d inst. Tho blast waa fired by Farmer's electro-dynamic blasting machine, the first used on this coast for the purpose. The Nevada *Transcript* says thet the amount of gravel thrown down, and the condition of the bank after the blast, has convinced all miners in this section that it is the only true way to blast to get the best results and full benefit of powder used. The bank was 150 ft. high. The main drift was 100 ft. back with three cross drifts, T's or L's. each 60 ft. long—280 feet of drifting in all. The bank was thoronghty shaken for over 60 ft. beyond the extreme back drift. Messrs. Park & Lacy, agents of the Burleigh drills in this city, are introducing thia blasting apparatus on this coast. We will shortly give a detailed description of it, es soon as the engravings can be prepared.

The miners of Ruby Hill and other mining districts have organized a Miner's Union. At the first meeting of the members, held at Ruby Hill on the 19th inst., the following officers were elected: President, M. L. Coady; Vice President, William Faught; Financial Secretary, Morgan Kavenaugh; Recording Secretary, S. S. Ritchie; Treasurer, A. Randolph; Conductor, Frank Birt; Warden, Frank Coyle. The organization promises to he a success.

The coast survey in Humboldt county is nearly completed.

Mechanical Drawing.

At the eascmbly of the students of the University of California on Friday of last week, John D. Hoffman gavo a lecture on "Mochanical Drawing," from which we take some extracts: In speaking to-day about drawiug, said tho speaker, I shall take a strictly professional view of the subject. I shall tell you how you may become practical draughtsmeu, and show that the surveyor eugineer, either civil or mechanical, ought to be a practical draughtsmen.

Drawing is the graphical representation of objects, either real or imagined—imagined in our case expressly for the purpose of being carried out in nature and becoming real. Now let me sketch the career of the draughtsman: His first practice will be free-hand drawing. All first practice is difficult and somowhat irksome. When you take your pencil in haud and find that you cannot do with it what you want to do, you ere apt to feel discouraged and thiuk that to do it requires *special talent*. Disabuse your mind of this idea. All that is required is the conviction that *real work* has begun, end must he carried on with earnest, thoughtful application. Without this apulication the most exalted talent will produce comparatively little. Let us look at some real work, executed for industrial purposes—for instance, the designs on calicoes, wall-paper, designs for carpets, etc. Try to copy them or invent some new ones and you will find that it requires a goodly amount of practice to produce anythiog as good. These designs are mostly produced in the factories by young men and women. By the by, girls make excellent draughtsmen. They have to work expeditiously, and are certainly not paid as artists. The necessity of supporting themselves has made them thoughtful and industrious, and their training rarely cousists in more than the first practice I recommend to you, zealously carried through. To become efficient in your profession, you are required to go through Calculus. Now, I have never met the person who discovered at the outset that he had a special talent for it; still it must be learnt, and you learn it, and ere glad of it afterwards. Drawing, in the same way, must he learnt.

After a little while of intelligent practice you will find that you had more talent thau you supposed at first, and the good opinion of yourself will increase with your progress, and with it the enjoyment in your work. All of you can become good practical draughtsmen, getting more and more expert in proportion as your profession offers you opportunities to execute drawings. The object of frec-hand drawing is to discipline hand and eye, the hand being the most teachable of the two. I will give a few instancea to prove that the eye must he educated to see. When I for the first time came among the negroes of a Virginia plantation, never having seen a colored man, except, perhaps, an isolated specimen in a traveling circus, I could not tell one individual from the other, nor could I distinguish males from females by the features in their countenances. A boy brought up in the city finds it hard to meke individual acquaintances, and has to be reintroduced many times to them before he knows them. A German lady told me when she first visited the United States she thought all the American ladies beautiful, very angels. She saw only the more delicate type of features. After her eye had become accustomed to the new type, educated, she began to perceive the differences in features, and had to acknowledge that there might be a few homely angels.

In your profession you want a keen, observing eye, that will take correct impressions at a glance. The surveyor passes rapidly over an unknown country, but he must see it and observe it. In running the boundary line between California and Nevada over a very rough, difficult country, I had two flag-men. The fore flag-man had to give sights ahead, in a straight line often distent a mile or more. He had to grope his way through gulches, timber, over rocks; but where he set up his flag he was seldom more than ten or fifteen feet off the line. He had an educated, keen eye. The hind flag-man had to set up on the station just abandoned by the instrument. He had plenty of time to study the line before him; but still he would get lost on his way from one station to the other, and had sometimes to be hunted up by others of the party, who found him bewildered and exhausted in some place far away from the line.

When you look now at some piece of machinery, especially if it be in motion, you will find it very difficult to see everything; whereas, when your eye is educated you will perceive the purpose of the construction and understand the thoughtfulness of the arrangements of its parts. The education of the eye begins with that of the hand with your first practice, and therefore I wish to impress upon you that your real work begins therewith. I will now make a few remarks, how you ought to begin and continue your exercises of free-hend drawing. You will understand that I only consider free-hand drawing as the *first practice for the mechanical draughtsman;* at the same time you may rest assured that there is nothing in this practice which will not help you along, if you intend to continue your free-heud drawiug into artistic regions.

You should begin with copying simple forms—contour lines from good drawiogs. I would prefer the forms of nature—forms of leaves, plants, flowers, going from the most simple to the most complicated ones. These will teach you a good deal beside drawing. Copy these forms; correct your copy patiently; end finally, when true, outline them with an even, deliberate line. Drawings of good architectural ornaments, and for advanced scholars, portions of the human frame, and, finally, figure drawing, is excellent practice.

With the brush you will have to practice laying on flat tints in India ink and color—next evenly, graduating from deepest shade to light.

FIG. 1. HARRIS' WATER HEATER AND CHEESE VAT COMBINED.

As soon as you have acquirsd some experience of haud and eye you ought to begin to draw from nature the same leaves and flowers you copy from drawiugs.

In shading take a cobble-stone or shell of uniform color, put it before you end try to reproduce on paper the delicate shading of nature. You will require all your patience and perseverance to vanquish that cobble-stone or shell, but when you have succeeded you will have made great progress in your carcer as a draughtsman,

Fig. 2. Harris' Improved Water Heater.

and your road will become more and more pleasant and enjoyable. Now, many may think that there is no use in drawing even so perfect a likeness of a cobble-stone. Will it do to have it framed and sent home to be hung up in the parlor? I, looking at these things professionally, think it will, and may show more real merit than many a dashiug sketch; and I only hope that I may succeed in converting you to my way of thinking. As you will see, we use drawing only as a means to commit our industrial thoughts to paper, and to have them carried out in the shop. Your conceptions may be bold, your combinations may be new and startling, but your drawing must only be true, simple, neat and clear.

"Heavy Blast.—A blast of from 2,500 to 3,000 tons was made at the mines of the Tomber Brook Mining Company, in Morris county, New Jersey, exceeding in magnitude any ever before accomplished in America."

This item we clip from an Eastern journal. The tons spoken of must refer to the rock, as it is scarcely probable thet they would fire from 2,500 to 3,000 *tons* of powder at once; but at first glance it looks as if they meant that quantity of powder. We do some pretty heavy blasting in this country, but not so heavy as that.

At the time those men were killed at the Justice mine there was much talk of lynching their slayers. Now the Graud Jury refuses to indict them and they are released.

About Addresses at Fairs.

People, somehow, will persist in believing, or in pretending to believe, that everything counected with agriculture must be serious, solemn, and rigidly practical. This error—end it is as great a blunder as the popular mind sver stumblod npon—has done much toward making agricultural journalism the dull, monotonous, unsatisfying stuff that it is.

The farmer is represented es writhing in the grasp of the monopolist. We must approach ths farm-house on tiptoe, as though it were the house of death or hopeless sickness. We should expect to be ushered into the solemn temple of the perseouted worshippers of common sense, by a woful visaged female, who is sinking under the disgrace of heiug "ouly a farmer's wife." The imagiuary farm house is entered, and the hoys and girls—embryo champions of the dignity of labor—are perusing, or pretending to peruse, the driest reading that the publishers of subscription books ever inflicted upon the country. The man of the house, to he consisteut with this newspaper style of farm life, must manifest the sereuity of the martyr, combined with the ferocity of a railroad conductor; no subjects, except such as are connected with crops, should be hroached in his presence; and he is not expected to say much on any subject, only gasping occasionelly, "how long, Mr. Nawspaper Writer, oh how long."

We shall not attempt to depict, in contrest with this, farm life as it is really fouud. Those who "have been there" know perfectly well that it is no more like newspaper farm-life than the social condition of any period is like that picture of it which is given in third-rate fiction. But the present, like all seasons of agricultural fairs, has brought out a point in connection with the error alluded to above, upon which we "rise to explain": it is the character of the addresses at agricultural fairs.

"What can he tell us about farming?" says the guardian angels of agriculture, when some accomplished speaker is announced to deliver an address at some fair. "What we want," they explain, "is plain, common sense; uttered hy a practical farmer." It is not, we repeat, the farmer himself who utters this unfriendly criticism; it is the agricultural flunkey who presumes, in the absence of the farmer, to speak for him on all occasions; and in his presence fawns and cringes, and exerts himself exclusively to convince the farmer that he has no sympathizer nor friend in this naughty world but he, Mr. Agricultural Flunkey.

Now, in our humble opinion, the season of fairs should be nothing more nor less than a great agricultural Sabbath. The farmer's mind needs this, as greatly as his muscles. It is not enough thet he is able to leave for a brief period the plow, the seeder end the harveste tbe mental faculties thet are brought intoreqni; sition in his vocation also demand their season of respite from toil. And especially should he have a few week's vacation from the school where incompetent teachers are endeavering to instill into his mind knowledge which they themselves never could fathom. While the farmer is enabled to flee from the sewing machine agent, the lightning rod man, and the book-canvasser, let him escape the presence of thet still greater bore, the agricultural demagogue, and dispenser of "useful information." Shallow, whining drivelers, who have got some one-sided Utopian idea into their heads, which they desire to "educate our farmers up to," superannuated professional men, who prate about the "dignity of labor." If ever a man had cause to exclaim "save me from my friends," it is the farmer of to day.

We are not afraid of being suspected of a design for leading the farmer astray—farmers are not so leadable as some people suppose—when we beg of him to not jealously withhold his own hardened hand from the more delicate one of the patient, enthusiastic student, the finished orator, nor even from the wealthy capitalist; for you will often find in such a one a true friend to yourself, and an ardent admirer of your calling; and either of these unhardened hands may be as honest as your own. Such men are regular visitors, careful observers, end liberal supporters of agricultural fairs; and when they meet the farmer there the pleasure and benefits derived from the meeting are mutual.

We would not, as a rule, go outside the farming fraternity for materiel for our fair addresses; nor would we wish to be restricted to this circle; and we believe we utter the hearty sentiment of the farming community generally, when we declare that the philosophy, the sentiment, the poetry, and the amenities of farm life, should prevail in these addresses, instead of labored scientific disquisitions, or the details of practical farming.

Let the bow of agricultural labor—mental as well as physical—be unbent for a time. It will be all the more effective when it is brought into service egain.

Prospecting for coal in the immediate vicinity of Verdi has been going on for some time, with fair hopes of success. Specimens have been tested to the satisfaction of the prospectors, and further efforts will be made to develop the ledge. That there is coal in the neighborhood cannot be disputed, for in several localities discoveries have been made that show unmistakable evidences of a regular formation.

About Fruit Drying Processes.

Preserving perishable food is a branch of industry of considerable importance to those suffering from inability to handle their bountiful harvest of fruits and vegetables. Many are endeavoring to solve the question of market and profit, for a dried article, and before canvassing any process of preservation, we offer some items from the Custom House reports. Into the port of San Francisco, for the year ending August 31st, 1874, $100,000 dollars worth of foreign fruit was brought. Just think of it ye fruit producers who ought to have reaped this harvest. In the United States, during the year 1873, over $9,000,000 worth of the same import was consumed.

These figures prove the demand. Why should this amount of money be paid for foreign produce and labor, when it would more than compensate the producers of this and other states, for the care and expense, involved in giving a well manipulated article to the commercial world. There is no reason why we should not use our surplus product to supply this demand; and to meet the necessity of rapid and easy work, comes the inventive power of our American mind. Already we have a number of processes in the field for preserving fruit and the root crops. Foremost in success in this industry is the method known as the Alden, but from its expense it fails to reach the mass of individual farmers, who are the ones to handle this question and reap the benefits. In many sections where co-operative establishments could be formed this is not excelled in its productions. Rider's American drier, however, comes nearer to the want of individuals. It is cheap, easy to handle and yields a fine article, but not in very large quantities. Later in the field comes Lloyd's process, which promises to do more work than either of the others, for the amount of money invested, reaching the farmer, who wishes a small machine for utilizing his own crop, or the capitalist who wishes a good and safe investment. A small farm drier, having a capacity equal to Rider's American will be put in the market at $60, and one carrying about two tons per day of 24 hours, will cost about $500. Fruits average from four to six hours in drying, with the exception of grapes and prunes, which take from 18 to 24 according to temperature. It is claimed that this is the only machine capable of handling hides, fish and meat on a large scale. The latter product, which we have seen, looks very fine, coming back to its original raw state after soaking in water.

A few words of knowledge gained abroad, and of experience here, and we close this article hoping it may benefit its readers with an idea of the demand for preserved food, and furnish some general knowledge of the modus operandi employed to give the present article of food to the market.

Raisins

Have the lead in price and consumption, the best being made from the Malaga. Muscatel or "sun raisin;" *these are dried on the vines*, the stem of each bush when ripe being partially severed and the leaves that shade it picked off. Thus exposed, the grapes soon shrivel by the evaporation of the water they contain, and become sweeter by the consequent concentration of the pulp. These, more than any other sort, retain the freshness and bloom of the fruit, and acquire less of the saccharine deposit which is found on most of the other varieties. Other raisins are prepared by drying the ripe grapes after they are picked, either in the sun or in heated rooms. Those known as the "Lexias," are so called from the lye employed in curing them. Included among these are the the varieties known as the Valencia and Denia. The best of these are hung on lines to dry in the sun, and as they begin to shrivel, they are dipped into weak lye, once or twice, then hung up again to complete the drying. The effect of the lye is to cause a saccharine exudation to take place, which forms concretions upon the raisins, and coats them with a thin varnish. Of Turkish raisins, two varieties, the Sultane and black Smyrnas are the best known. The former are from a small, delicious grape without seeds, and come packed in drums. The latter are also small, but have very large seeds. As a rule, they are free from the sugary concretions which are common to other sorts.

A very important variety of raisins, and one rarely understood to be the fruit of the vine, is the dried currant of commerce. This is a very small sized grape, largely cultivated at Patras, in Zante, Ithaca and Cephalonia. Its name is a corruption of Corinth or Corinthian grapes. They are no larger than peas, and the bunches are three inches long. The importation of raisins averages over $1,000,000 yearly; that of Zante currants about $300,000 yearly.

Prunes.

The best varieties of prunes are made from the Saint Catharine plum and the prune d'Aglue. After being exposed in the air for several days, until they become soft, they are shut up close in a spent oven and left 24 hours. They are then taken out, and replaced after the oven has been slightly reheated on the next day; they are turned by slightly shaking the sieves on which they have been laid. The ovens are heated again, and they are put in a third time. After remaining 24 hours they are taken out and left to get quite cold. This same process of heating the ovens is gone through with twice more; after which they are packed in boxes ready for sale. Can not this process be expedited by some of our American mechanics?

Apples

Our home production of apples comes next on the consumer's list. And in a fine article of machine dried fruit, a very palatable food reaches the public. But we deprecate the mode of bleaching by use of diluted sulphuric acid which though rendering them snowy in appearance robs them of all flavor. In the rapid evaporations which is natural in a drying machine, a fine color of a very pale yellow tint is left, but beware of too white an article, it has no taste.

Peaches

Are prepared in the best manner by putting them into boiling water for a moment, and then into cold, to prevent cooking. After which they will peel with perfect ease and can be dried to look very bright in any machine where artificial heat is applied. Nectarines and plums may be served in the same manner.

Onions and Potatoes

having been recommended as Army and Navy rations, on account of their preventive and curative properties in diseases occasioned by use of too much salt food, will always be staple articles and bring good prices. Onions are 40 cents and Potatoes 14 cents per pound.

Meat

preserved by evaporation without salt or cooking, brings 40 cents also. The method of cooking, by dipping into hot water and then salting to excess, afterward drying in the sun, is too old fashioned to suit the modern palate, which craves a more eatable food, when unable to obtain fresh.

Musk.—Musk is a secretion, and is obtained from the musk deer (*Muschus moschiferus*), a pretty little animal inhabiting the higher mountain ranges of China, Tonquin and Thibet. The musk is found in a small pocket or pouch under the belly of the deer. The hunters cut off this pouch, which becoming dry preserves its contents and in this state the best article reaches our markets. Musk, when moderately dry, is an unctuous powder of reddish brown color! It gives out a powerful odor, of a warm, aromatic character and most wonderful persistency. Blending well with almost every other scent, it discovers but little of its own peculiarity in compounds in which it is an ingredient.

Genuine musk is very costly, being worth when separated from its sac and all extraneous matter, from $25 to $35 to the ounce. Its great strength compensates in a measure for its price. One part of musk, it is said, will scent more than 50 tree thousand parts of inodorous powder.

A correspondent of the *Times*, writing from Alexandria, facetiously remarks: "Fancy mutton fattened on ancient Egyptians! The other day at Sakhara I saw nine camels pacing down from the mummy pits to the bank of the river laden with nets, in which were femora, tibia and other bony bits of the human form, some 200 weight in each net on each side of the camel. Among the pits there were people busily engaged in searching out, sifting and sorting the bones which almost crust the ground. On inquiry, I learned that the cargoes with which the camels were ladened would be sent down to Alexandria, and thence to be shipped to English manure manufacturers. They make excellent manure, I am told, particularly for Swedes and other turnips. The trade is brisk, and has been going on for years, and may go on for many more. It is a strange fate—to preserve one's skeleton for thousands of years in order that there may be fine Sonthdowns and Cheviots in a distant land. But Egypt is always a place of wonders."

Progress in China.—As an evidence of the progress evident in the East we learn that a Chinese Polytechnic Institution and Reading Rooms have recently been organized at Shanghai, China, with the object of bringing the sciences, arts and manufactures of Western nations in the most prominent manner possible before the notice of China. When the wants of the enormous population, as well as the immense, but hitherto almost latent resources of that country are taken into consideration, it is easy to see the great advantages that an institution of this kind is calculated to confer both upon the natives generally and upon European manufacturers and merchants. Shanghai being the great center of foreign commerce with the Chinese, is manifestly the most suitable locality for its establishment.

Phosphoaized Iron.—One per cent. or less of phosphorus so far modifies cast iron that it will resist the action of concentrated sulphuric acid to a greater degree than when entirely free from phosphorus; and those who separate silver and gold by the sulphuric acid process find that some cast iron vessels are destroyed in a few weeks, while others will last for years. Phosphorus modifies also the physical properties, imparting to the iron more fidelity when in a melted state and furnishing more compact castings.—*Iron.*

The average cost of a ton of coal, as purchased by the London gas companies in 1873, was £1 4*s*. 6·14*d*., the total outlay being £1,753,715. In 1862 the average was 17*s*. 6·15*d*. per ton; in 1871, 15*s*. 9·92*d*.; in 1870, 16*s*. 3·74*d*; and in 1869, 16*s*. 3·75*d*. Accordingly, these figures show between 1869 and 1873 a rise of 50 per cent. in the price of coal as purchased by the London gas companies.

Prof. Agassiz on Specialists.

In an address to the students of Penikese Island, he said, among other valuable suggestions: "You have been told here that books are of little use. Ours is a tirade against compilations, and not against original works, which you will find of use for reference. You have here for teachers men who are not only specialists, but each an original investigator in his branch or department. In order to know the animal kingdom right, method is more important than the study of a number of species; indeed a very few specimens are needed to illustrate the study of natural history. An eminent botanist said, he could teach botany, all he knew on the subject, from nine or ten specimens; so I can count on my fingers the whole number of specimens thoroughly known. Natural history is so vast a subject that if we would accomplish anything, we must be specialists."

We may add to this that the same may be said of all other branches of study; physics, medicine, chemistry, etc., have each become so vast a domain of research, that it has become almost impossible to be equally well informed in the whole field, so it has come to pass that among physicists there are electricians, opticians (we do not mean the traders in specs, who call themselves such), etc.; among physicians there are oculists, aurists, dentists, and special practitioners for special diseases, and for every separate part of the body except one. In chemistry we have metallurgists, also those who make paints or dyes a separate study; others who do the same for vegetable or for animal chemistry, etc. In fact in this nineteenth century all sciences have become so extended, that their branches form separate sciences by themselves, each of them sufficient to command so much attention that a whole life may be devoted to the study and advancement of a single branch.—*Manufacturer and Builder.*

Soavengering in Paris.—The *Debats* gives an account of the scavengering of Paris, the efficiency of which might serve as hints to the authorities of our large cities. The superficial area of the streets is eleven million metres, and to cleanse this before the traffic of the day begins, operations have to commence about 3 A. M. The staff employed musters in brigades at certain points of each quarter, and is then dispersed over the various streets. Beside them may be seen the nocturnal philosophers who pry into the filth and rubbish deposited near the curb. The two classes are on very friendly terms, the scavenger facilitating the *chiffonier's* search, and assisting him, if necessary, to obtain a good harvest. In addition to sweeping by hand, more than forty machines are at work, something like those used in the city of London. The driver, who must keep an eye on his horse, manages a spring which raises or lowers the sweeping cylinder. These are principally used for boulevards, avenues, wide streets, and squares, and are at work nearly all day. In bad weather they traverse the most frequented streets and sweep away the mud or snow. Sweeping by hand is very active the whole morning in the vicinity of the chief markets, where masses of rubbish of all kinds are found. Between six and ten o'clock scavengers are there hard at work, and heaps of rubbish are carted away.

Transit of Venus.—The Astronomical Commission deputed by the Mexican Government to observe the transit is composed as follows: Francisco Diaz Covarrubias, Sub-Secretary of State in charge of Public Works, chief of the expedition; Francisco Jimenez, Ingeniero Geografol, second astronomer of commission, Manuel Fernandez, topographical engineer and computer; Auguetin D. Barroso, computer, naturalist and photographer; Francisco Bulnes, computer and chronicler. The Commission is composed of good material. All those comprising it are gentlemen well qualified by general and special scholarship for the task before them. The party left for Japan on the "Vasco de Gama" last Monday, and expect to take up a position near Nagasaki or Yokohama. This makes the 16th party in the field to observe the transit of Venus.

Heavy Blast.—A mouster blast of 1,815 kegs of powder was fired in Pond & Constable's claim, at Todd's valley, on the 16th inst. It cost the company over $6,000, and was a perfect success. The discharge was made by electricity.

Gold in the Dutch West Indies.—The gold diggings in French Cayenne having proved remunerative, the Stadtholder of the Dutch West India colonies has sent out an expedition to the Maryone river in the hope of equally favorable results.

As an illustration of the extent of the jute manufacture, it may be stated that 100,000 tons of the fibre have this year been imported into Dundee alone by direct shipment from Calcutta.

Placer County miners are briskly engaged preparing for the season's work. If water should be plenty next year, an immense amount of gold will be taken out of our gravel banks.

A controlling interest in the Oak Grove quicksilver mine has just passed into the hands of Wm. A. Stuart. It is situated between the Ida Clayton mine and Pine Flat.

It is estimated that 10,000,000 boxes of sardines are annually sent away from the coast of Brittany to all parts of the world.

Gas on Railway Cars.

On one of the railways in Prussia the cars have been lighted by gas for about a year. The experiment has been so successful that there is little doubt of the ultimate exclusion of all kinds of oil lamps on the railways of Germany. The gas is manufactured expressly for this purpose from oil, being a richer hydrocarbon than common street gas. It is compressed to six atmospheres in cylindrical reservers five feet long, and from 16½ to 20 inches in diameter. If more than two receivers are to be connected, the connecting tubes are of one-fourth inch bore, very strong. A regulator is introduced intermediate between the burners and the receivers, in which the requisite low pressure is maintained so steadily that all the tremors and shock to which the cars are subject produce no perceptible effect upon it. This regulator consists of a cast-iron circular vessel 10 inches in diameter and six inches in hight, the open top of which is closed gas tight by a flexible membrane loosely stretched. The middle point of the membrane is armed with a metal disk, connected with a lever acting on the supply valve communicating with the gas holder. The weight of the membrane and its connections is made sufficient to furnish all the pressure needed to maintain the efflux at the burner. When the supply in the regulator is low, the supply valve is opened by the depression of the membrane. As the gas streams into the regular the membrane rises, and the supply valve is gradually closed. The illumination is thus maintained even more steadily than the gas jets in the cities, though the pressure in the gas holders of course gradually falls off. A single holder of six to nine cubic feet capacity will supply a burner for 45 to 67 hours. The intensity of the light, by photometric determination, is equal to that of ten candles, while that of ordinary coal gas, burnt at the same rate and under similar circumstances, is but about 3½ candles. The burners in actual use give about seven candles light; the Argand lamps usually employed give a light of only four candles. The whole apparatus, except the burners and their protecting lanterns, is placed beneath the cars. There seems to be no possibility of danger from its use, except such as might result from explosion.—*R. R. Register.*

Scientific and Practical Books on Mining, Metallurgy, Etc.

Published or issued, wholesale and Retail, by DEWEY CO., Mining and Scientific Press Office, S. F.

BY GUIDO KUSTEL,

Mining Engineer and Metallurgist.

Roasting of Gold and Silver Ores, and the Extraction of their Respective Metals without Quicksilver. 1870.

This rare book on the treatment of gold and silver ores without quicksilver, is liberally illustrated and crammed full of facts. It gives short and concise descriptions of various processes and apparatus employed in this country and in Europe, and explains the why and wherefore.

It contains 142 pages, embracing illustrations of furnaces, implements and working apparatus.

It is a work of great merit, by an author whose reputation is unsurpassed in his specialty.

Price $2.50 coin, or $3 currency, postage free

Concentration of Ores (of all kinds), including the Chlorination Process for Gold-bearing Sulphurets, Arseniurets, and Gold and Silver Ores generally, with 120 Lithographic Diagrams. 1867.

This work is unequaled by any other published, embracing the subjects treated. Its authority is highly esteemed and regarded by its readers; containing, as it does, much essential information to the Miner, Mill man, Metallurgist, and other professional workers in ores and minerals, which cannot be found elsewhere in print. It also abounds throughout with facts and instructions rendered valuable by being clearly rendered together and in simple order. It contains 120 diagrams, illustrating machinery, etc., which alone are of the greatest value. PRICE REDUCED TO $5.

Nevada and California Processes of Silver and Gold Extraction, for general use, and especially for the Mining Public of California and Nevada, with full explanations and directions for all metallurgical operations connected with silver and gold from a preliminary examination of the ore to the final casting of the ingot. Also, a description of the general metallurgy of silver ores. 1864.

As its title indicates, this work gives a wide range of information, applicable to all vein miners and workers in precious metals, affording hints and assistance of exceeding value to both the moderately informed and the most expert operator.

Price, $5 in cloth; $6 in leather—coin.

BY OTHER AUTHORS.

The Quartz Operator's Hand-Book; by P. M. Randall. 1871. Revised and Enlarged Edition. Cloth bound, 175 pages. Price, $2.

Sulphurets: What They Are, How Concentrated, How Assayed, and How Worked; with a Chapter on the Blow-Pipe Assay of Minerals. By Wm. M. Barstow, M.D.; 1867; cloth bound, 114 pages. Printed and sold by Dewey & Co. Price, $1; postage free. The best written work, and most complete work on the subject treated.

ANY OTHER BOOKS DESIRED will be furnished at the most reasonable rates by Dewey & Co., Mining and Scientific Press Office, S. F.

A Good Binder for $1.50.

Subscribers for this journal can obtain our Patent Elastic Newspaper File Holder and Binder for $1.50—containing gilt title of the paper on the cover. It preserves the papers completely and in such shape that they may be quickly fastened and retained in book form at the end of the volume, and the binder (which is very durable) used continuously for subsequent volumes. Post paid, 25 cts. extra. It can be used for Harper's Weekly and other papers of similar size. If not entirely pleased, purchasers may return them within 30 days. Just the thing for libraries and reading rooms, and all who wish to file the Press. 1sm bp

DEWEY & CO.

American & Foreign Patent Agents,

OFFICE, 224 SANSOME STREET, S. F.

PATENTS obtained promptly; Caveats filed expeditiously; Patent reissues taken ont; Assignments made and recorded in legal form; Copies of Patents and Assignments procured; Examinations of Patents made here and at Washington; Examinations made of Assignments recorded in Washington; Examinations ordered and reported by Telegraph; Rejected cases taken np and Patents obtained; Interferences Prosecuted; Opinions rendered regarding the validity of Patents and Assignments; every legitimate branch of Patent Agency Business promptly and thoronghly conducted.

Our intimate knowledge of the various inventions of this coast, and long practice in patent business, enable us to abundantly satisfy our patrons; and our success and business are constantly increasing.

The shrewdest and most experienced Inventors are found among our most steadfast friends and patrons, who fully appreciate our advantages in bringing valuable inventions to the notice of the public through the columns of our widely circulated, first-class journals—thereby facilitating their introdnction, sale and popularity.

Foreign Patents.

In addition to American Patents, we secures with the assistance of co-operative agents, claims in all foreign countries which grant Patents, including Great Britain, France, Belgium, Prussia, Austria, Victoria, Peru, Russia, Spain, British India, Saxony, British Columbia, Canada, Norway, Sweden, Mexico, Victoria, Brazil, Bavaria, Holland, Denmark, Italy, Portugal, Cuba, Roman States, Wurtemberg, New Zealand, New South Wales, Queensland, Tasmania, Brazil, New Grenada, Chile, Argentine Republic, AND EVERY COUNTRY IN THE WORLD where Patents are obtainable.

No models are required in European countries, but the drawings and specifications should be prepared with thoroughness, by able persons who are familiar with the requirements and changes of foreign patent laws—agents who are reliable and permanently established.

Our schedule prices for obtaining foreign patents, in all cases, will always be as low, and in some instances lower, than those of any other responsible agency.

We *can and do* get foreign patents for inventors in the Pacific States from two to six months (according to the location of the country SOONER than any other agents.

Home Counsel.

Our long experience in obtaining patents for Inventors on this Coast has familiarized us with the character of most of the inventions already patented; hence we are frequently able to save our patrons the cost of a fruitless application by pointing them to the same thing already covered by a patent. We are always free to advise applicants of any knowledge we have of previons applications which will interfere with their obtaining a patent.

We invite the acquaintance of all parties connected with inventions and patent right business, believing that the mntual conference of legitimate business and professional men is mutual gain. Parties in doubt in regard to their rights as assignees of patents, or purchasers of patented articles, can often receive advice of importance to them from a short call at our office.

Remittances of money, made by individnal inventors to the Government, sometimes miscarry, and it has repeatedly happened that applicants have not only lost their money, bnt their inventions also, from this cause and consequent delay. We hold ourselves responsible for all fees entrusted to our agency.

The principal portion of the patent business of this coast has been done, and is still being done, through our agency. We are familiar with, and have full records, of all former cases, and can more directly judge of the valne and patentability of inventions discovered here than any other agents.

Situated so remote from the seat of government, delays are even more dangerous to the inventors of the Pacific Coast than to applicants in the Eastern States. Valuable patents may be lost by the extra time consumed in transmitting specifications from Eastern agencies back to this coast for the signature of the inventor.

Confidential.

We take great pains to preserve secrecy in all confidential matters, and applicants for patents can rest assured that their communications and business transactions will be held strictly confidential by us. Circulars free.

Engravings.

We have superior artists in our own office, and all facilities for producing fine and satisfactory illustrations of inventions and machinery, for newspaper, book, circular and other printed illnstrations, and are always ready to assist patrons in bringing their valuable iscoveries into practical and profitable use.

DEWEY & CO.,

United States and Foreign Patent Agents, pnblishers Mining and Scientific Press and the Pacific Rural Press, 224 Sansome St., S. F.

The Mining and Scientific Press--Ever Onward.

Our careful system of compiling, judiciously condensing, and conveniently arranging into regular departments, has been heartily endorsed. It renders the paper worth more to readers, who can find handily that which interests them most.

The weekly issues of the PRESS will contain reliable

Information for Practical Miners,

Treating on the Opening of Mines; Mining of Ores; Milling of Ores; Smelting of Ores; Separation and Roasting of Ores; Amalgamation; Saving of Gold and all precious Metals; New Processes of Metallurgy; New Discoveries of Mines; Mining Engineering and Hydraulics.

For Inventors, Mechanics and Manufacturers.

All new and important developments in Scientific and Mechanical Progress; Patents and Inventions of the Pacific States; Progress of Home Industries; Hints for Local Manufacturers; Illustrations of New Machinery; Reports of Popular Scientific and Industrial Lectures.

Our Mining Summary

Gives the progress of mining work from week to week in the various counties and districts throughout the principal mining regions of the United States, arranged in alphabetical order. It is the most extensive record of mining operations published in the world. It affords the intelligent miner a rare opportunity to know and profit by the work and experience of his neighbors. Miners have few sources of practical information in their calling, and should embrace every reliable means for improvement. Mining Operators and Shareholders, at home and abroad, weekly examine our Summary with increased interest and profit.

Our "Domestic Economy"

Embraces new and important facts which should be known in every cabin and household. Short and interesting—the articles under this heading are freely read and practiced with profit and improvement to the readers.

The PRESS is not strictly a "paper for professional scientific men," but rather a

Liberal and Popular Scientific Journal,

Well calculated to make practically scientific men from our intelligent masses. This is our stronghold for accomplishing good. Plain, correct and pleasing language, easily comprehended by all, confined mostly to short articles, is our endeavor.

For Self-Improvement,

Every issue of the PRESS abounds with articles of an elevating character, to stimulate the higher virtues and natures and progressive intellects of both men and women.

Hundreds of Dollars

Are oftentimes saved to the readers of this paper by a single hint or article of information in its columns; Such instances have been repeatedly reported to the editors and proprietors during their long connection with the PRESS. Our paper presents

The New and Novel Developments

In the progress of this comparatively new section of the Union (but recently settled and now rapidly increasing with a population of the most intelligent and venture. some people, attracted from nearly every quarter and clime on the globe), enable us, with due enterprise, to display vigor and freshness in our columns not met with in similar journals elsewhere. The same circumstances also render such a paper more especially valuable to its readers in a new, and, to a certain measure, untried field, where the best methods and processes of industry are not so well established or traditionally known as in older communities. Published experiences often save costly experiments and disastrous results.

A Great Variety of Industrial Information,

in brief and fresh form, suited to the wants and tastes of the readers of this coast, which is not obtainable otherwise so timely, or in so cheap and convenient form. As an industrial publication, meeting the wants of so many kindred industries, this journal stands pre-eminent and without a precedent.

Subscriptions payable in advance—$4 per annum Single copies, post paid, 10 cents. Address

THE NEW WINCHESTER

REPEATING RIFLE,

(Model of 1873.)

San Francisco Agency.

The Winchester Repeating Arms Company, of New Haven, Conn., have recently made still further valuable improvements on the celebrated Henry Rifle, which now make it, beyond doubt, the most magnificent weapon in the world. They have just introduced this beautiful arm upon the market, and their San Francisco Agency is fully supplied with all the various styles, together with cartridges for the same.

In the manufacture of the new gun, iron mountings (blued or case-hardened) have been substituted for gun metal or brass, thus increasing the strength of the arm and decreasing its weight. It is also now so constructed as to carry a Central Fire Cartridge holding one-third more powder than used in the cartridge of the model of 1866, thereby greatly augmenting the power and accuracy of the weapon.

THE SPORTING RIFLE

Has a Set or Hair Trigger which can be used at will—set or not set, as preferred. All the arms have a sliding lid which covers the opening in which the Carrier Block moves up and down. This lid, by the action of the Carrier Lever, is always open when the gun is fired, and closed by hand when the firing ceases, thus protecting the lock and inner works of the gun from dust and rain.

Various other improvements, which it is not necessary to mention in detail, by which the strength of the several parts is increased and the general appearance of the gun improved, have also been made.

There is now a greater variety of the Sporting Rifle than heretofore. They can be had with a length of barrel (round or octagonal) ranging from 24 to 30 inches, fitted with Globe and Peep Sights, or any other kind in use.

The Carbine is now made with all the improvements above referred to, except the set trigger.

The Sporting Rifle and Carbine will also be made as Extra Arms, Gold, Silver or Nickel Plated, plain or beautifully engraved.

MILITARY ARMS.

Still further improvements have been accomplished which overcome all objections heretofore raised against the Repeating Rifle as an army gun. It is safe, certain and effective in fire, whether used with deliberation or during excitement in action, and no more motions are required than in operating the old muzzle gun.

More extended and minute particulars concerning the new gun can be had by writing or applying to the San Francisco Agency for circular.

CARTRIDGES.

The trade is notified that the Shells of the Central Fire Car ridge for the new gun can be reloaded, and that the Winchester Repeating Arms Company are manufacturers of every description of Cartridge used for Carbine, Rifle and Pistol of any make, and that the Company have a full stock constantly on hand at their San Francisco Agency

Ayer's Hair Vigor

—FOR—

RESTORING GRAY HAIR

TO ITS NATURAL VITALITY AND COLOR.

Advancing years, sickness, care, disappointment, and hereditary predisposition, all turn the hair gray, and either of them incline it to shed prematurely.

AYER'S HAIR VIGOR, by long and extensive use, has proven that it stops the falling of the hair immediately, often renews the growth, and always surely restores its color, when faded or gray. It stimulates the nutritive organs to healthy activity, and preserves both the hair and its beauty. Thus brashy, weak or sickly hair becomes glossy, pliable and strengthened; lost hair regrows with lively expression; failing hair is checked and stablished; thin hair thickens; and faded or gray hair resume their original color. Its operation is sure and harmless. It cures dandruff, heals all humors, and keeps the scalp cool, clean and soft—under which conditions, diseases of the scalp are impossible.

As a dressing for ladies' hair, the VIGOR is praised for its grateful and agreeable perfume, and valued for the soft luster and richness of tone it imparts.

Shonld have a copy of Brown's

507 MECHANICAL MOVEMENTS,

Illustrated and described.

Inventors, model makers and amateure mechanics, and students, will find the work valuable far beyond its cost Published by DEWEY & CO., Patent Agents and pubilshers of the Mining and Scientific Press. Price, post paid, $1.

Health of the State.

In August last the Stete Boerd of Health ssued a circular signed by Dr. Thomes M. Logar, Secretery, for the purpose of obtaining ee much as possible of the information which mey have accrued since the American occnpetion of California respecting the effects of settlement, cultivation, drainage, irrigation, mining operetione, equeducts, reservoirs, forests and tree culture—eepecielly the *Eucalyptus Globulus*, or Australian gum tree—upon the eanitary condition of the inhabitants. This information ie desired more particularly with a view of discovering some means of controlling —or at least of modifying the influence of malaria in the prodnction of fevers, and also of determining by the vote of ropresentative men both in and ont of the medicel profession, the prevalence of consumption in each section of the State, in its reletion with soil moisture, nneffected by immigretion or emigietion, likewise the best climetee and locelitiee for the amelioration of its epecial types and stages.

We mentioned this eubject at the time of receiving the circnlar and now speak of it again for the purpose of reminding our readers that answere to the qnestions, when properly compiled, will be of greet value to the State at large. Dr. Logan solicite answere to the qnestions printed in the circular, end stetes that extended answers, striking exemplee in illnstration of theoriee, topographicel description of places represented, or a monograph on any subject, germene to these inquiries, provided it is written in a compect manner, would be gladly received. The blanke are arrenged in such a menner as to be readily filled out with little trouble. They can be procnred by addressing Dr. Logan at this office, where we have a cupply.

The Early Rain.

Mr. Croeker expresses a characteristic feeling of disgust at the recent rains: He deolaree thet they are quite out of time; and hes notified ns thet a dry winter must inevitably follow. With the exception of Mr. C., however, the copions showers, several in nnmber, which we heve had of late, have been thankfully received. The farmer says it will expedite the inangnration of the plowing seeson—a very desirable point—it will do something towards opening the dairy season at en earlier date, and will eave cnred feed.

The city people are also glad. For—thanks to the beneficent powers thet are not influenced by discrimineting newspeper twaddle — the rain, and its gladdening consequenoes, falls upon the city as well as npon the country. It ie confidently hoped thet the price of butter will eoon come down in consequenoe of the rain. It is now nearly ont of sight, and beyond the reach of poor people. These realistic canses are snfficient to make the people of the city rejoice at the approach of the rain, bnt they have roesons of a still finer texture. They want to eee the hille in the suburbs of the city oovered with the green mantle of winter; and they anticipete with pleasure a generel freshening np of field and garden, shrubs and flowers.

There ie something about the loug deferred rain which is refreshing to the heart, even; and to geuge the appreciation of onr late reine by eny estimate of dollars end cents, wonld do injustice to the people who mako it a topic of conversation.

The Pioneer Wagon Factory.—A correspondent sends ns the following items abont the firet wegon manufectory in the city of Sen Francisco: John Lewton, a pioneer from Troy, New York, soon after his arrival in this city in the "spring of '50," concluded he would "dig for gold in wegon hube end eich." Accordingly he started bnsiness on Kearny street, near Sacramento. At that time the only building standing between Kearny and Dupont wae an old adobe house, occupied by the "tall woman." In those deys Kearny etreet wae a sandy trail and Montgomery was planked only to California etreet. Here he built the first truck ever construoted in Sen Francisco. It was made for John Lay, who paid $500 for it. In 1853, Lewton moved hie shop to Bush etreet, near Kearuy, where the Californin Theater now stends. In 1860 he removed to Market street, between Montgomery and Kearny etreets. In 1862, heing ronted hy fire, he opened again on Merket street, between Sutter and Powell; thence he removed to Nos. 20 and 22 on Seventh street. This prospering business is now carried on by the sons of the now aged pioneer, under the namee of Elhurton and G. Webster Lawton, in their own speoious two-story building, 50x120 feet in eize. Their boss hlecksmith, Enoe W. Berber, is a "'49er," from Rnode Ieland, and the carriege painter, Louis Smitten, ie from New York. The establishment ie vigorously at work on new and old cerriagee, wheele, etc., giving employment to from 15 to 18 hands. They did a business last year of $21,000, aud this year will exceed $25,000.

A fire whioh occurred at the Black Diemond Coal Company's worke on Saturday night, destroyed the splendid new engine and other property of the company, causing a total loss of over $50,000. The mines of the company are situated in Contra Costa county, abont six miles south of the San Joaqnin river.

General News Items.

Brutal Assault.—A brutal assault was made upon the person of Mr. P. H. Sumner, at Oekland, on Monday evening lest, while going to his place of residence. He was knocked down with a sand bag, brutally kioked and left for dead. He eurvived, however, and was taken home by a neighbor, bnt at lest accounte was nnable to communicete any particulars. Robbery wes evidently not the object of the assent. Some think it due to the interest he hee taken in the temperance movement in Oakland. Othere sey that he haa received threatening letters since he took an active pert in turning the Rev. Parshall out of his church. It is hoped that the whole affair will be brought to ligbt when Mr. Snmner has sufficiently recovered.

A Dangerous Rock in Mid Ocean.—The discovery is announced of a dengerous rock in the middle of the Atlentic Ocean, and in the direct track of Europeen steemere. It projects about 18 feet out of water at low tide, and is only about 3,000 feet long by 30 or 40 wide. It wae formerly eet down in the charts; but hae latterly been omitted in the supposition that it had no reel existence. It is thought that its presence may account for the mysterions disappeerance of the "President," "City of Boeton," "Pacific" and meny other vessels which have been lost withont leaving the elightest trace of their fate.

A war olond seems to hang over Europe jnst at this time, growing out of the apparent nnfriendly relations between Rnesia and Germany. If a war should break ont between these two countriee, not only Frence, bnt most likely several other continental powers, would beoome involved. The repeated assurances of the "Great Powers" of the prospects of long-continued peace, while differences and annoyar cee are known to exist, only eerve to create still greater nneasiness.

A Fatal Affray occnrred at Porterville, Tulare county, on the 22d instant, between J. A. Floyd and employees of the Queen circus troupe. Floyd wes shot and seriously injured, and Frank B. Holton was etebbed aod instantly killed. The Coronor's jury justified Floyd. Holton recently lived in Stockton. His father lives in Sacramento. He was a nephew of Generel Ben Butler.

Making for the Hills.—The Gilroy *Advocate* of the 24th says that the squirrele, gophers, tarantules and other creeping thinge thet burrow in the ground, are all leaving the valleys, and taking up their line of march for the hills. It is said they go in droves, and are seemingly anxious to get into winter quarters ae soon ae possible.

The situation in Louisiana can be pretty well nnderstood, when it is stated that the tax levy this year for State purposes foots np 7¾ per cent. Thie does not inclnde the tax in cities for municipel purposes. Can any one be surprieed thet the people are dissatisfied? This rate of taxation is in excess of the nsual interest in most of the States of the Union.

The Carlists.—Now that Alfonzo, brother of Don Carlos, hae got ont of the way of harm, and the Don's fighting General Dorregaray is safely held hy the French anthorities, and small bodies of Carliets ere making epeciel terms for themselves with the Spanish authorities, it would seem that the rebellion mnst be well nigh cloeed ont.

The "City of Peking," when one day out from New York, lost one of the blades of her propeller, and eleven days after loet another, in consequence of which she wae obliged to put into Rio de Janeiro, to replace them. She was supplied with extra blades and a coffer dem to uee in replacing them.

Grain Exposed.—It was eetimated just previous to the etorm of Sundey that there was at leest 25,000 eacks of grain exposed to the weather on the line of the narrow-gange, between Monterey and Salinas City, to say nothing of the amonnt on the depot gronnde at the latter plece.

The salmon lew expires with October. The prospect of a lerge catoh is extremely good, but the prices in this market will be a little uppish for the first month or six weeks. Fifteen cents to two hits a pound will be about the figure.

The Parents of Charley Ross.—The Boston *Globe* hae information thet the mother of Charley Rose, the abdncted child, is becoming insene over her grief, and that the father hes heen reduced to a bed of eicknese, from which it ie doubtfnl if he will ever arise.

A San Franoisco prodigy, "General Dot," the rival of Tom Thumb, is creeting a sensation in Peris. Hie real name is Leopold Kohn, and he wes born in San Francieco, his parents being both of full size. Dot weighs eighteen pounds.

Incease of Population.—There have come into California by sea and land, in the nine months ending September 30th, some 60,500 persons. The departuree in the eame time were 27,700; showing a gain of 32,800.

"Sixteen Killed" and meny seriously injured is the reported result of the explocion of the boiler of the steamer "Brooklyn," on Detroit river on Wednesday last.

Mining in Napa.—It is estimated that there are 300 men engaged in active mining pursnits in Napa connty.

Just What Ails California.—Recently two boxes of applee came to ue from Oolfex, weight in all 80 ponnde, R.R. freight 10 ots. for the lot. Transfer from R.R. depot to 224 Sansome street, S. F., 50 cts.—three times what it ought to have been. Express to Oaklend by slow ronte, 50 cents. From O.P.R.R. depot, Sen Francisco, to Franklin street, Oakland, $1. Onr citizens are outrageouely cherged like this for nearly all the little accommodatione needed, and it makee living so high that manufacturing and other industriel pureuits, which give so much life and progress to Eestern Stetes, are impracticable at present here. Let us have reform from the bedrock.

Slight Damages by the Rain.—The latest accounts of the effects the late rains ehow thet in some ceses they were slightly damaging. In some localities—in the Russien river region for instance—where the hervests ere always late, the nnthreshed grain was injured to some extent, end at Watsonville and some other pleces where a portion of the hay wes unproteoted, this crop was also damaged by wetting.

Nena Sahib.—A person calling himself Nena Sahib, the chieftein who took a moet prominent pert in the Cawnpore maseacre, has been arrested in Britieh India. He deniee, however, that he committed the atrocitiee attributed to him. There are grave donbts ae to his identity; and some time after his arrest he said he made the confeseion while in a state of intoxication.

A Cool Robbery.—About the coolest robber that Boston has seen for a long time is a men who went to the Public library building, and borrowed tools from eome workmen, removed the copper lightning rods, laboring several hours, and heving loaded his spoils upon a wagon, rode off. Tho workmen supposed he wae acting nnder orders from the city.

Von Arnim.—The London *Standard* says the examination of the archives of the German legation at Paris hes feiled to lead to the discovery of any weighty evidence against Count Von Arnim. The letest telegraphio dispatches eey thet the Count has been set at liberty, but will not be allowed to leave Germany.

The great cotton case now before the U. S. Snpreme court iuvolves from $12,000,000 to $15,000,000. If the case is decided favorably it will throw this vast amount into the hands of a few individuele, who have bought np the cleims for a mere aong—'and that's the wey the money goes."

Lecture on California.—G. A. Johnson, editor of the Santa Barbara *Press* lectured at Cooper Institnte, New York, on Tuesday and Wednesday eveninge lest, on Southern California, or "New Itely," ae he calls it. The lecture was well received.

Adrift.—The "Costa Rica," on her wey from Panama, became disabled about 100 milee from Sen Diego, and wes towed into that port by the "Newbern." A steemer has been sent from this city to tow her np. She has thirty peesengers.

A Woolen Mill for Santa Rosa.—Prominent men in Santa Rosa feel certain of the snccessfnl establishing of a woolen mill during the coming year; $35,000, in enms of from $5 to $1,000, have been promised by responsible perties.

A Woman Sentenced to be Hung.—Mrs. Johnson, who was convicted of murder in the first degree for poisoning her huebaud in May last, will be hung at Mayville, New York, on Friday of this week, nnless Governor Dix interferes.

Saved by her Corsets.—Jamea Bowering hes been convicted in Toronto, Ont., for attempting to kill a youog lady who had rejected his addresece. The ball from hie pietol struck the steel ribs of her corset, which saved her life.

Increasen Mail Service.—The Post Office Department on the 26th instent ordered the mail service between Soledad and Los Angelee, via Santa Barbara, California, increased from six times per week to deily.

Oakland Terrifien.—Incendiaries appear to be holding a cernival at Oakland. No less than seven fires occurred there within the 30 houre ending with Mondey lest. A number of other fires have occnrred since.

The Bakersfield and Lone Pine etage company are now completing arrengements to put on a tri-weekly line of stagee between Bakersfield and Panamint.

The Fermers' Bank of Wheetland has filed erticlee of incorporation. The capital etook is $125,000, divided into 1,250 shares of $100 each.

A temperance crnsade hes been inangurated by the women of Liverpool; the werfare, however, to be strictly confined to temperance halls.

Loss of Life by Fire in England.—A cotton mill in Chester connty, England, wes burned, together with operetives.

Pursuit of Hostile Indians.—Col. Buell has destroyed 475 Indian lodgee on the Salt Fork of Red river.

The Trains Free.—The gamblere have been driven from the traine passing through Nevada.

Damage to Cotton.—The rain has done much damage to the unpioked cotton crop.

Patents & Inventions.

A Weekly List of U. S. Patents Issued to Pacific Coast Inventors.

[From Official Reports for the Mining and Scientific Press, Dewey & Co., Publishers and U. S. and Foreign Patent Agents.]

By Special Dispatch, Dated Washington, D. C., Oct. 27th, 1874.

For Week Ending Oct. 13th, 1874.*

Process of Manufacturing Products from Animal Fats.—Geo. Bloom Van Brunt, S. F., Cal.

Gang Plow.—Robt. N. Howes, Wm. A. Dorr and J. B. Webeter, Stockton, Cel.

Sun Dial.—David B. Scofield, Auburn, Oregon.

Reissue.

Shingle Machine.—Frank A. Hnntington, S. F., Cal.

Trademark.

Hair Restorative.—Tilton & Cammet, S. F. Cal.

*The patents are not ready for delivery hy the Patent Office until some 14 days after the date of issne.

Note.—Copies of U. S. and Foreign Patents furnished by Dewey & Co., in the shortest time possible (by telegraph or otherwise) at the lowest rates. All patent bnsiness for Pacifio coast inventore transacted with perfect security and in the shortest time possible.

From an Inventor.

The following letter, which was recently received from an old client of Dewey & Co., now residing in one of the Eestern States, speeks for itself, and will do more, perheps, to convince inventors of our cepacity for bnsiness than eny number of locel complimente. We extract ee followe:

Gentlemen: It wee throngh yonr house that I secured my first patent, and although I have eince done bueiness here in the Atlentic Stetes with the ablest patent solicitors—gentlemen who have done me justice—yet I have often regretted that yon were too far off to advise with me in my ceses. It has teken a longer time with every patent I heve taken out since I left California and oeme Eest, than in the ceses yon prepered for me in San Francieco, which ie certainly very creditable to yon.

By the wey, one of my patents has passed the ordeal which is the esaential test of a patent'e valne. I mean that of a trial in the courte, and it stood the bettling of one of the best lawyers in the country. The specifications and claims were completely made ont and there wae a perfect comprehension of its principle during the trial. Since giving it thie test we thought that we would make it even etronger, if possible, and eubmitted it to one of the best patent solicitors for advice. After a careful examinetion of the ceee he edvised ue to let it elone ae it etood, seying that whoever mede np those papere nnderetood their business. I then informed him that they were drewn np by Dewey & Co., of San Francisco, and he replied thet he knew yon well by repntation. * * * * * Very truly youre,

L. L. Sawyer.

Meriden, Conn., May 16, 1874.

The Cerson river hae risen considerably since the recent rains, and the quertz mills are ell nnning to their full cepecity.

The Bidwell Bar nining claim, Butte Co., wes last week sold to Geo. C. Perkins for $18,000.

Female proepectors are hnnting for qnicksilver in Sonoma county.

Our Agents.

Our Friends can do much in aid of our paper and the cause of practical knowledge and science, by assisting Agents in their labors of canvassing, by lending their influence and encouraging favors. We intend to eend none bnt worthy men.

L. P. McCarty—Generel Agent.
W. H. Rattenberry—California.
Chas. W. Otis—Contra Costa County.
Chas. T. Bell—Alameda, Santa Clara and Santa Cruz Counties.
J. W. Anderson—Orange and Santa Ana, in Los Angeles County, Cal.
Hoon Alston—San Lnis Obispo, San Bernardino and San Diego Counties.
Jas. Kearney—Amador, Calaveras, Tuolumne and Mariposa Counties.
B. Goodwin—Sacramento Connty.
S. G. Crawford—Nevada, Sierra and Plumas Counties.
J. G. Kelley—For Washington Territory.
B. W. Crowell—California.
F. B. Alderson—Nevada.

FROM AN INVENTOR.

Placerville, October 3d, 1874.

Messrs. Dewey & Co.—*Gentlemen:* Yesterday I received from you my Letters Patent for my Hydraulic Mining Lamp, and I herewith tender you my grateful acknowledgements for the energy and promptness which you have displayed in working said invention through the Patent Office for me; and shall in the future, as well as the past, recommend all parties having new inventions, to go direct to the office of Dewey & Co., and ask for Mr. Boone, in the Patent Department, and if he cannot procnre a patent for them, they will find it useless to try further. Yours Respectfnlly, C. B. Bnown.

Campo, San Diego Co., Cal., Jnly 3d, 1874.

Messrs. Dewey & Co.—*Gentlemen:* To-day I received the patent and other papers of my animal trap, that you so successfully worked throngh the patent office for me, for which please accept my best wishes. The chances are that I will have another application for yon to make for me before long. I am well satisfied with your manner of doing business, and I think inventors of this coast stand in their own light when they do not put their business into your hands.

I remain yours truly, A. M. Gass.

Fourth Year of the Pacific Rural Press.

The publishers of this journal design making its weekly issues during its fourth year (1874) still more acceptable and valuable than those of the past.

A Farmer's Paper Always.

The RURAL PRESS—established Jan., 1870, has been thoroughly a farmer's paper—" first, last, and always." Its success in popularity and rapidly increasing circulation has exceeded that of any other weekly on the coast.

Neither Politics or Creeds.

We refer with satisfaction to the independent, chaste and useful character of our reading matter and the absence from our columns of questionable and demoralizing advertisements.

We shall strive to make it an ever welcome visitor to those who desire to constantly

Improve the Heart and Mind,

And shall give a larger space to our HOME CIRCLE department, which from the first has been a popular feature of the RURAL.

Our aim is to gather information from all reliable sources, in the varied forms in which it is to be obtained. Our work is to divest our gleanings of all superfluities; condense such information as is of most importance to our special class of readers—give it to these in the plainest and lowest words possible,—saving *their time by our labor.*

Our Leading Departments

Will be continued under the following heads:

The Home Circle,	The Horse,
Young Folk's Column,	The Swine Yard,
Short Stories,	Sericulture,
Home and Farm,	The Vegetable Garden,
Useful Information,	The Flower Garden,
Domestic Economy,	The Vineyard,
Good Health,	The Orchard,
The Dairy,	Tropical Fruits,
The Apiary,	Small Fruits,
Poultry Notes,	The Cereals,
Horned Stock,	Pasturage, etc.,
Sheep and Wool,	Fertilizers,
Goats,	Miscellaneous.

Practical Farmers

Know how important it is that the above subjects should be treated from a local standpoint—that generally the farming tactics of the East will not do for this coast; that agriculture, in its infancy here, can derive greater benefits from an exchange of experience through the columns of the press than in older fields. Constantly observing and studying developments in the special field we represent, we can be expected to give truer information on agricultural subjects, than more general writers at home or abroad.

Our Traveling Correspondents

Will do much service by gathering a large amount of interesting information from various parts of the Coast, which, but for their research and practiced observation, might never be placed on record or reach the eye of the reading public. Of our many

Local Correspondents

We have particular reason to be proud. No paper on this Coast—old or new—has ever been so highly favored with volunteer contributions. They are talented, reliable, independent and generous representatives of an intelligent and enterprising people, noble types of good humor, unselfishness and true progress.

Short Stories,

Original and selected, will hereafter appear in each number. Their selection, we trust, will be such as to render them popular and unobjectionable to all. In addition to a large number of

Fine Engravings,

Representing Choice Stock, Farm Products, Scenery, Remarkable Productions, Improvements in Farming Implements and Machinery, Works of Art and the Beautiful in Nature, we shall from time to time present the modest

Faces of Prominent Farmers

Who, as pioneers in the development of agriculture on this Coast, or as active laborers in the "Farmers' Cause," are worthy of the distinction they enjoy, and the favor with which they are looked upon by our many readers at home and abroad.

Engravings (costing thousands of dollars originally) are inserted in our columns during a single year. They afford instant and perpetual impressions often more perfect and real than words can convey.

Patrons of Husbandry.

We shall continue to give our weekly summary of matters connected with the interest and progress of this growing and important movement. We shall aim to give information as fresh as possible in this department. Its readers are aware that the RURAL has been in the lead in calling farmers to organize. We shall continue to work zealously with the Granges for the noble objects of the Order.

The present is an

Important Period

In the history of our Coast. The coming 12 months promise greater developments in its agricultural progress than have been experienced in any previous year. Agriculturists are alive to improvements in every direction, and those who would keep up with the spirit of the times should certainly read the RURAL PRESS.

The S. F. Market Reports

Will receive greater attention in the department of DOMESTIC PRODUCE than that of any other weekly journal. We shall spare no pains to render the reports as reliable and complete as possible. By the employment of our special reporter we hope to make this very important part of our paper one of its best and most satisfactory features.

Kind Words and Acte

Have done much to build up in this isolated and sparsely settled coast so large and complete an agricultural journal as the PACIFIC RURAL PRESS. We commence the new year with a regular circulation of

Over 5,000 Copies,

A far greater issue than that of any weekly on this Coast, independent of a daily publication. If our friends will continue to "help us help ourselves," we hope to reach a circulation of 8,000 this year, and do a correspondingly greater service of good. While we have the greatest advantages and can make by far the best weekly for

Agriculturists on This Side of the Continent,

We cannot expect one-half so large a circulation as journals in older and more populous districts. Consequently readers cannot rightly expect such a paper here at Eastern rates.

No Premiums But a Good Paper

Do we offer. A flashy chromo (or cheap map), with an ill suited paper, will hardly satisfy the farmers of this Coast, whose time is too precious for trifling. To many of you the benefit of a reliable and valuable paper should reach a hundred fold its cost, while to all a poor journal would be dear at any price.

Sample Copies Furnished Free

On receipt of stamp for postage.

Agents are Wanted

Who will do more or less active canvassing. To such we will furnish free samples and pay liberally for their services.

SECOND EDITION—REVISED AND ENLARGED.

The Explorers', Miners' and Metallurgists' Companion.

Comprising a Practical Exposition of the Various Departments of Exploration, Mining, Engineering, Assaying, and Metallurgy.

Containing 672 Pages and 83 Engravings

BY J. S. PHILLIPS, M. E.,

Of California, a Practical Operator for Thirty-four Years; Explorer, and Resident in the Pacific States and Territories for the past Eight Years.

PRICE, bound in cloth, $10.50; in leather, $12. Forwarded by mail for 60c. extra, at the MINING AND SCIENTIFIC PRESS Office, by

DEWEY & CO.

THE GREAT MEDICAL SUCCESS OF THE AGE.—Leading druggists who have been in business for half a lifetime state that they have never known a medicine to enlist the entire and universal confidence of the public as rapidly as *Hale's Honey of Horehound and Tar.* Although it has only been a few years in use, it has already taken precedence of all other medicines advertised as remedies for Coughs, Colds, and incipient Consumption, and its annual sales are without a parallel in the history of this class of preparations.

Pike's Tooth-Ache Drops—Cure in one minute.

FOR STATE OF NEVADA.—We have appointed Mr. F. B. Alderson our special agent and correspondent for the State of Nevada. He will visit our friends and patrons there soon.

Designing
and
Engraving
at
This Office.

We are prepared to do fine Wood Engraving for illustrating Landscape Scenery, Buildings, Machinery, Works of Art, Manufactured Articles, Trade Marks, Seals, Etc. We have a first-class

Machine for Engraving

A portion of the work, which can be finished thereby more perfectly than by the eye and hand alone. Our patrons can depend upon first-class work always, and at reasonable prices. Samples can be seen at our office.

DEWEY & CO.

To Mining Secretaries.

An amendment to Section 336 of the California Code, taking effect **July 1st, 1874,** provides that in addition to the regular publication of the assessment and sale notices as heretofore,

PERSONAL NOTICE

Must be served as provided in the following quotation from the law:

"The notice must be personally served upon each stockholder, or in lieu of personal service, must be sent through the mail, addressed to each stockholder at his place of residence, if known, and if not known, at the place where the principal office of the Corporation is situated."

The above refers to the ASSESSMENT NOTICE only. Advertisers in the MINING AND SCIENTIFIC PRESS will be furnished with copies of assessment notices printed on slips suitable for serving personal notice under this law at short notice.

DEWEY & CO., Publishers.

June, 1874.

Mining and Other Companies.

H. Hampton, Trustee	5	225	67 50
H. Hampton, Trustee	6	225	67 50
OLD ISSUE.			
William Sell	36	100	67 50
William Sell	37	100	67 50

And in accordance with law, and an order of the Board of Trustees made on the 19th day of September, 1874, so many shares of each parcel of said Stock as may be necessary, will be sold at public auction at the office of the Company, 217 Sansome street, San Francisco, California, on the 16th day of November, 1874, at the hour of two o'clock, P. M. of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of the sale.

W. S. ANDERSON, Secretary.

Office—217 Sansome street, San Francisco, California.

Land Purchasers' Association—Office, No.

331 Montgomery street, Room 7, San Francisco, Cal.

Notice is hereby given, that at a meeting of the Directors or Trustees of this corporation, held on the 28th day of October, 1874, an assessment of ten dollars per share (being the 42d monthly installment on the subscription to the stock) was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary, at No. 331 Montgomery street, Room 7 San Francisco, Cal.

Any stock upon which this assessment shall remain unpaid on the 30th day of November, 1874, will be delinquent and advertised for sale at public auction, and unless payment is made before, will be sold on the 24th day of December, 1874, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

C. S. WRIGHT, Secretary.

Office, No. 331 Montgomery street, Room 7, San Francisco, California.

The Orleans Mining Company—Principal

place of business, San Francisco, California. Location of works, Grass Valley Township, Nevada County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 16th day of October, 1874, an assessment (No. 1) of one dollar per share was levied upon the capital stock of the corporation, payable immediately, in United states gold coin, to the Secretary at the office of the company, Room 8, 315 California street, San Francisco.

Any stock upon which this assessment shall remain unpaid on the 2 th day of November, 1874, will be delinquent, and advertised for sale at public auction, and unless payment is made before, will be sold on Tuesday, the 15th day of December, 1874, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

J. F. NESMITH, Secretary.

Office—Room 8, No. 315 California street, San Francisco, California. oc24

The Orleans Mining Company---Principal

place of business, San Francisco, State of California. Location of works, Grass Valley Township, Nevada County, State of California.

There will be a special meeting of the Stockholders of the Orleans Mining Company, on Tuesday, the 10th of November, 1874, at 1 o'clock, P. M., at the office of the company, room 8, No. 315 California street, San Francisco, California, to take into consideration the disposal of the company's reserve stock, and transaction of such other business as may come before the meeting.

By order of the Board of Trustees.

J. F. NESMITH, Secretary.

Stanislaus River Mining Company—Lo-

cation of principal place of business, San Francisco, California. Location of property and works, Stanislaus River, Tuolumne County, California.

NOTICE.—There are delinquent upon the following described stock, on account of assessment (No. 4) levied on the 23d day of September, 1874, the several amounts set opposite the names of the respective shareholders, as follows:

THE
AMERICAN TURBINE WATER WHEEL

Recently improved and submitted to thorough scientific tests by James Emerson, showing the following useful effect of the power of the water utilized, being

THE HIGHEST RESULTS EVER KNOWN.

Percentage of part gate, ¼ 50.08; ½ 69.64; ¾ 78.73; ¾ 82.53; ⅞ 82.90. Percentage of whole gate, 83.14.

Mr. Emmerson says: "These are the best average results ever given by any Turbine Wheel in my experience."

A splendidly illustrated descriptive catalogue, or any further information desired, furnished on application to

BALL'S
SWEEPING DREDGE,
A NEW AND VALUABLE
CALIFORNIA INVENTION,
Has been very lately well proven by performing a job of dredging at the mouth of San Antonio Creek, at Oakland, Cal.

There is but this one machine that has ever had these improvements employed. It is an old machine, formerly built for another device, and is unfavorably constructed for Ball's improvements; yet this first temporary experimental machine has filled a scow of eighty-five cubic yards in sixteen minutes in unfavorable digging. For durability, digging hard material and fast work, it has a reputation (supported by leading engineers) as having no equal.

Testimonials and references will be given on application to the inventor, who is the sole owner of patents (excepting having made an assignment of the one machine now belonging to the Central Pacific Railroad Company). Having resolved not to sell any rights unless upon a basis of actual work performed by a machine built by myself for the purpose of fairly establishing the worth of the invention, I therefore offer to sell machines or rights on the following plan, which is warranting the capacity of the machine by actual work:

I will enter into an agreement with any responsible party to build and sell a machine, scows and tender, all complete, and right of all my improvements in dredging machines throughout the Pacific Coast for $20,000, warranting the machine to dredge six cubic yards per minute (to fill a scow at that rate). $20,000 will but little more than pay the cost of building the machine, scows, etc., all complete; therefore I am proposing to ask *nothing* for my patents unless my machine dredges more than six cubic yards per minute. But it shall be further agreed that in case (at a fair trial to be made within a stated time) the machine shall fill a scow at the rate of more than six cubic yards per minute, then $10,000 shall be added to the price above stated for each and every such additional cubic yard thus dredged per minute, and for additional fractions of a cubic yard thus dredged in the same ratio the $10,000 is to be added to said price above stated.

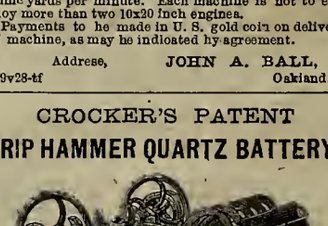
I will sell any other Territorial or State rights (either United States or Foreign) upon the same plan and at a lower price proportionately than the rights for the Pacific Coast.

I will sell a single machine with scows and all complete, and right to use the same in a limited territory, for $20,000 on the same plan as above stated, but will add only $2,000 to each additional yard over the six cubic yards per minute. Each machine is not to employ more than two 10x20 inch engines.

Payments to be made in U. S. gold coin on delivery of machine, as may be indicated by agreement.

Address, JOHN A. BALL,
9v28-tf Oakland.

CROCKER'S PATENT
TRIP HAMMER QUARTZ BATTERY.



This machine, complete, weighs 1,500 lbs. Has an iron frame, five steel arms with stamps weighing 17 lbs. each, which strike 2,000 blows per minute, in a mortar provided with screens on both sides, and crushes FINE 600 lbs. per hour, requiring one-horse power to drive it. Has been thoroughly tested, and is guaranteed to give good satisfaction. PRICE, $600.

G. D. CROCKER,
17v26-tf 315 California street, San Francisco.

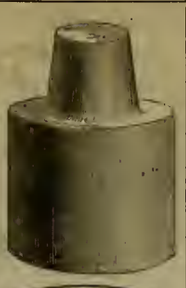
Of all sizes—from 2 to 60-Horse power. Also, Quartz Mills, Mining Pumps, Hoisting Machinery, Shafting, Iron Tanks, etc. For sale at the lowest prices by

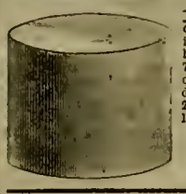
10v27tf J. HENDY, No. 32 Fremont Street.

Improved Cast and Forged

STEEL SHOES & DIES FOR QUARTZ MILLS.

[PATENTED MAY 26TH, 1874.]





To Superintendents of Quartz Mills and Mining Men Generally.

We guarantee these SHOES and DIES to do the work of four sets of iron and to be at least 10 per cent cheaper. They are gradually coming into use in all of the principal mills on this coast.

Their advantages over iron are cheapness on first cost, increased crushing capacity, time saved in changing and in setting tappets, increased value of amalgam by absence of iron dust and chippings, and a saving of 75 per cent. in freight. They possess a similar superiority that steel rails do over iron rails. It takes 40 days to fill orders from the manufactory East. Price 20 cents per pound shipped at San Francisco. Terms liberal.

Address all orders, with dimensions, to

Varney's Patent Amalgamator.

These Machines Stand Unrivaled.

For rapidity pulverizing and amalgamating ores, they have no equal. No effort has been, or will be spared to have them constructed in the most perfect manner and of the great number now in operation, not one has ever required repairs. The constant and increasing demand for them is sufficient evidence of their merits.

They are constructed so as to apply steam directly into the pulp, or with steam bottoms, as desired.

This Amalgamator Operates as Follows.

The pan being filled, the motion of the muller forces the pulp to the center, where it is drawn down through the aperture and between the grinding surfaces.—Thence it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, and to the circumference as before. Thus it is constantly passing a regular flow between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powder, and the metal amalgamated.

Setlers made on the same principle excel all others They bring the pulp so constantly and perfectly in contact with quicksilver, that the particles are rapidly and completely absorbed.

Mill-men are invited to examine these pans and setlers for themselves, at the office, 229 Fremont Street, San Francisco

Cazin's Combination Ore-Sizer and Concentrator—One Plunger System.
[Covered by Letters Patent of July 2d, 1872, and recent applications.]
Containing a sizing apparatus, (revolving screen) delivering two or tour sizes of ore to two or four rows of sieves, each row independent of the other, and each having 5 sievee, each row concentrating according to specific gravity the special sizs sutomatically fed unto it, reeulting in the simultaneous continual delivery of separated materials, working 2d and 3d-cl-ss ores into 1st-class ores of perfect cleanness. It thoroughly separates native gold or copper from quartz or any other lods matter;—galena and silver sulphurets from pyrites; baryta and quartz; and pyrites from quartz.
Added to a battery of stamps these mschines constitute a full system of ore concentration, sufficient in most cases for the requiremeuts of western mines, with a capacity of 15 or 20 tons per 24 hours.

Purifying Quicksilver.

We give on this page the process employed at New Almaden for purifying quicksilver from the soot and other foreign matter which becomes intermingled with it during the condensing and reducing process, or that may become intermingled with it in any other way. The blast or draft which draws off the mercurial fumes into and through the condensers from the furnace where the ore is roasted, also carries with it a mechanical mixture of fine dirt, particles of unconsumed carbon, some ash, some undecomposed cinnabar, and various other impurities and minute particles of the metal. This combination of matter is deposited in the condensers in a condition resembling lamp black or paste, it having become moistened by the steam introduced from the fuel and ore, and, as a consequence, it becomes intermingled with the quicksilver.

James B. Randol, superintendent of the New Almaden mine, and Charles W. Wright invented and patented the method herein described of purifying the mercury when in the state referred to. To do this, the quicksilver, intermixed with soot or other extraneous substances is placed in an iron tank marked *A*, to which water heated to the required degree is added, and the substance intimately mixed. Wood ashes or other suitable alkali are added for the purpose of still further cleaning the quicksilver, which is then drawn off through the pipe, *G*, into the vessel, *H*. The apparatus for supplying hot water is simple. A boiler or heating apparatus is placed under the tank; *E* being the fire door and *F* the ash pit. The cold water supply pipe, *D'*, has a float ball, *K*, attached to the valve, so that the tank gets the requisite supply without attention. The cold water pipe, *D*, feeds the boiler with water which on being heated passes into the tank, *J*, through the hot water pipe, *C'*. The water in the tank, *J*, is kept at the boiling point, and is drawn into the soot tank, *A*, as required through the hot water pipe, *C*.

When the soot and ashes are put into the tank, *A*, the hot water is shut off. A man mixes the soot, ashes and hot water thoroughly with a shovel, and thus separates the soot from the metal, allowing the quicksilver to pass off clear and pure through the siphon, *G*, into the vessel, *H*. The shaded lines in the tank, *A*, represent the water and soot, the darker part showing the position of the soot. This apparatus can be kept running continuously and is very effective. The process has been in use at New Almaden for over a year, and is also in use at the Great Western mine. The Kellogg Furnace Co., at Knight's Valley, have also purchased the right to use it. All the quicksilver is saved from the soot by this process, which has worked satisfactorily at the mines where it has been in use.

DROWNED OUT.—The Stanislaus river mining company, operating in the Stanislaus river at the old Central Ferry, have been unfortunate again this season. The company is a live one showing good pluck and energy with a determination to see the bottom of the river, which promises to yield a good amount of the precious ore. Last year the claim was brought to working condition when the waters rose and stopped operations before any returns were obtained. The *Union Democrat* says that this year promised better, a short time ago everything was ready, rich gravel was being taken out when the storm came, the water rose, saving of lumber, pumps and other appliances became the necessity of the hour. We learn nearly all the appliances were saved. It is too bad the company has been so seriously impeded by the elements.

THE cinnabar and silver fever has extended to Modesto. A company has been formed with the view of prospecting claims in the Coast range, east of Grayson. Many men are already at work in these mountains, and some excellent croppings of silver have been discovered.

ALL the mills and mining companies are getting in stores for winter.

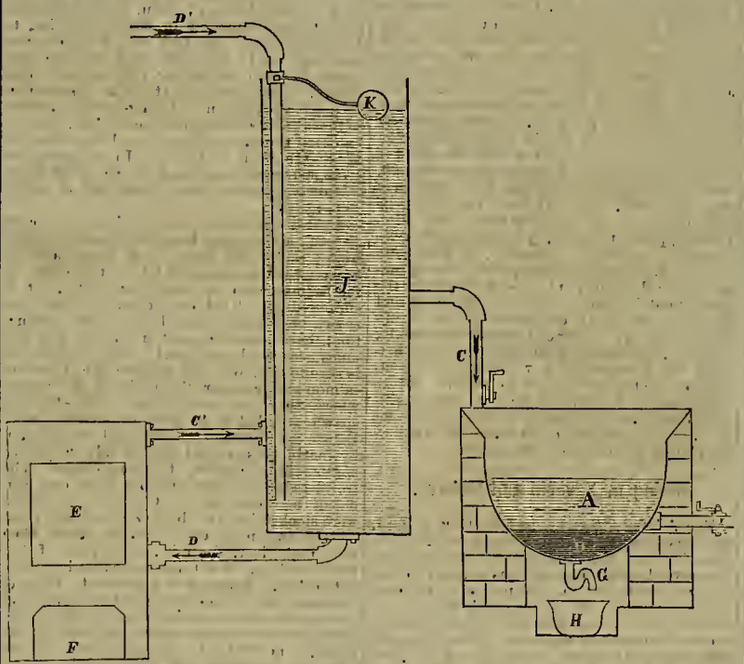
Patent Nonsense.

It is really amusing to read some of the criticisms of the daily press on our Patent Law. The following article we clip from the *Daily Evening Post* of this city, dated Nov. 2d.:

"When the United States grants letters patent to an inventor it declares only that the invention if new and original is one which can be patented. The inventor no doubt believes that he is the first inventor, but in nine cases out of ten where an invention is useful it turns out that some one has previously invented the same thing, though he has failed to bring it into public use. Inventors and purchasers of new patents often do not find this out until they have invested large sums of money in procuring, perfecting and working the patent. The knowledge of this fact enables speculators to get hold of new and valuable inventions by ransacking the archives for forgotten inventions of a similar character, purchasing them for a song, and then frightening owners of meritorious inventions into giving away half or three-fourths of their interest to save the balance and avoid litigation. It is now seriously urged by some of the Eastern Press that the patent laws should be changed, and that the search for prior inventions should precede instead of following the issue of the letters patent. In the patent office are the only full records of United States patents. Their number is great, and is increasing rapidly every week, but as they are classified, experts could in a reasonable time make the necessary search. It is suggested that it would be well even to increase the fees if necessary, for the inventor could better afford to pay $160 to his agent for a patent which, like any United States patent for a portion of the public domain, would be unassailable and irrevocable, than to pay $40 for a patent which proves nothing, not even that somebody else had not two years before received a patent for identically the same invention."

The writer of this above article evidently did not know that a corps of seventy-one examiners are constantly employed in the United States patent office, examining into the novelty of patent applications *before the patents are granted*. If he had ever made an application for a patent he would have learned that his application had to pass through an ordeal of examination previous to its allowance by the office that would astonish his innocent ignorance. Ten to one he would find himself rejected on references that would require a wonderful stretch of mechanical imagination to discover any similarity between them and his invention. Yet with all this strictness of examination before granting patents, duplicate patents are sometimes issued; and that such is the fact is no wonder, when we consider the multitude of patents which have been issued from the office, and the number requiring to be examined daily in order to keep the work of the office from running far behind.

The trouble, we apprehend, is with the patentees themselves. It is too often the case that when an inventor improves some old machine



RANDOL & WRIGHT'S QUICKSILVER PURIFYING APPARATUS.

and secures a patent for his improvements, that he either through ignorance or wilfully represents that his patent covers the entire machine, whereas it only covers the improvements. In such a case the trouble complained of by the *Post* would certainly occur; but our system of examinations and granting and issuing patents is correct, and our Government always sustains a patent when it is possible, for all that it covers.

A SOUTHERN extension of Colonel Wilson's coal mine, at Lincoln, has been opened at Cook's ranch, where a wide stratum of fine coal abounds. Another vein has been discovered at Whisky Diggings, ten or twelve miles farther east, an old pioneer mining locality where considerable gold was taken out about 18 years ago. The last deposit is of the anthracite character, and is likely prove of value.

A PARTY of several persons employed at the Butte Flume and Lumber company, made boxes for boats and came down the flume one day last week. They started at 4 P. M., and arrived at 12 midnight, making the trip in 8 hours; distance, about 40 miles.

COAL has been discovered on Patrick Nicholas' ranch near Benicia. Although only surface ore, and mixed with conglomerate, it ignites readily and burns steadily, furnishing a good degree of caloric, and with little apparent waste.

LAKEPORT is excited over quicksilver discoveries at Clear lake.

A NEWSPAPER will soon be published in Pauamint.

Academy of Sciences.

The regular semi-monthly meeting of the California Academy of Sciences was held on Monday evening last. The donations to the museum were as follows: A collection of ores and minerals from different donors. John Edwards, of Thompson Flat, three miles north of Oroville, Butte county, presented fossil teeth and a leg bone, found in a hydraulic mine in that locality, at a depth of thirty feet, in a stratum of sand, close under a layer of pipe clay, and about two feet above the bed rock. Many other bones were unearthed at the same time, but they were much broken up by the hydraulic piping, and washed away.

W. G. W. Hartford presented a large specimen of the cuttle-fish, from the island of Santa Rosa. G. Larkin, of the California market, presented a similar specimen.

Dr. W. H. Dall, of the United States Coast Survey, presented a collection of small shells from the Soloman islands.

General Colton presented unusually fine specimens of fossil fish, from the Church Buttes, Wyoming Territory.

J. Begg, of Gilroy, presented specimens of the enormous cone of the Saberriana, from Southern California. Mr. Begg is engaged in the construction of a large pyramid, artistically designed, containing all the varieties of cones found in Californoia, for exhibition at the Philadelphia Centennial.

W. H. Ford presented through Barry & Patten specimens of the caddis worm, found in Nisgara creek, near the summit of the Sierras, Tuolumne county.

Henry Edwards read the tenth paper of his series on Pacific coast Lepidoptera.

Dr. Harkness described a recently extinct volcano which he discovered in the course of a recent trip in portions of Lassen and Plumas counties. He also described a lake as large as Donner, which he had discovered near the volcano, at an elevation of 7,330 feet above the level of the sea. We will give Dr. Harkness' description of these curiosities in full, shortly.

Dr. Behr made some remarks on the Encalyptus globulus, or blue gum tree. He stated that he had been recently informed by an Australian correspondent that the wood of this tree made most excellent shingles, by reason of its non-inflammable characteristics. It was a common joke in Australia to hand new comers an ember from the fireplace of this wood, by which to light their pipes. It would go out as soon as drawn from the fire. Made into shingles it furnishes a first-rate fire-proof material for buildings.

LATE advices from Cape of Good Hope report that new gold discoveries have been made in that section, causing great excitement. As soon as the reports regarding the new diggings reached the settlements, hundreds flocked thither. The discoveries are said to be rich and extensive, and yielded well.

THE Portland Boiler Works, of this city, have just finished a new smokestack for the steamer "China," 10¼ feet in diameter, 40 feet long and weighing 7 tons.

THE waters of Great Salt Lake, according to the monument of Black Rock, have receded several feet in the past six months, through evaporation and other causes.

THERE was coined at the Carson Mint, during October, $541,000 in gold and silver, the largest amount ever coined in that institution in a single month.

THE Panamint operators must have faith in that country. They will have put out probably half a million dollars before they get anything back.

SENATOR JONES is spreading his mining operations as far north as Oregon.

GALENA has been discovered in Kern county, near the railroad.

THE Humboldt reduction works resumed operations on Wednesday.

Mining in Colorado.

A remarkahly open and pleasant autumn is drawing to a close, and parties who have spent their summer in working or prospecting in the ontlying districts, are returniug to the mining center for the winter, thereby increasing the number of laboring men in our community, where they will find abundant employment. For ns here the season has been one of uusual activity in mining. In many mines, for years idle, work has been reeumed, and nonproductive mines have been converted into productive ones. Our gold and silver bullion shipment from this county will foot up three millions of dollars this year, one-eighth of which will be silver from our gold ores, obtained mainly in smelting. More miues are today worked with profit than duriug any previous period of our history. Formerly, when ores ran down as low as five ouncee of bullion per cord, work was discontinued, because it did uot pay. At the commencement of the year there were a great nvmber of mines in whicb a vast quantity of low grade ores was known to exist. In these mines and the portions of rich mines where low grade ores existed, people have entered and successfully solved the question of working them to a profit. A large portion of our bullion shipments has been derived from this source, and yet they have in every instance been worked with profit. In many mines, where at the beginning of work only low grade ore was in sight, the comparatively barren ground is passed, and rich ore in large quantities is being raised, thus showing that, though poor oree do exist in most mines, they also alternate with rich ores. While the low grade ores have paid, the rich ones yield immense profits.

Work this year bas been prosecuted almost exclusively by private enterpise, and this too in many inetances where the operations of companies have resulted in failure. Roberts & Co. have paid a high royalty to the owners of the Ophir mine, and yet have been growing rich. For years they have worked on tribute, and have always made it pay. Meesrs. Kimber & Co., on the Gnnnell, are another example of the same sort. As an element in the present success, the reduction of wages is not to be overlooked, $2 50 per day being the current rate of wages; as much as $3 was paid last year. The half dollar gained from this source is alone enough to change the balance from the debit to the profit side of the account, nor does it appear in the least degree probable that wages will again advance in price. Wages are far too low in the East; too many working men are idle there, and the cost of passage from the East here is too low, having fallen to $35 for immigrant fare from New York here. These facts are known alike to the employer and employed. The cost of living here is greatly reduced from the standard of a few years ago, and is destined to be still lower. While year after year our forests disappear, and thus the source from which our fuel so far as it consists of wood becomes so remote, yet the price bas not risen, and the vendors of coal are now prepared to lay it down at our mines and mills cheaper than wood can be furnished. The success of the past year is such that the amount of work performed during the year that is gone will be greatly in excess of that of the year passing away. Already the work of resumption has received an immense impetus. The first of January will bring consolidation to a host of mining interests at present disjointed, and while the production of the country with its six thousand inhabitante will reach nearly or quite three millious this year, it promises to be increased from 24 to 50 per cent. for the year to come. To secure the greatest success, several changes and additions to present facilities are necessary. We need still cheaper living. We must have greater economy in personal and business expenses. Our people from the wealthiest to the poorest wear too expensive clothing and eat too expensive food.

Less expensive articles in both lines would afford greater comfort and better health, and would secure greater prosperity.

Above all, we want water, in snch quantity as to create water powers in so close contiguity to our mines as to afford a sufficient supply for our mills, domestic use and security against the ravages of fire. There can no longer be a doubt that as a private enterprise and investment of individual capital, it will pay. In many instances, the greatest expense attendant on the raising and reduction of ore is the hauling. While no scheme bas so far ripened as to present even incipient fruit, there is still good reason to believe something will be accomplished within a twelvemonth.

Looking over the entire field and taking all its incidents and bearings into consideration, the prospects for the future were never so good as now, and this is conceded to be the case by everybody, whether mining or not.—*Colorado Register.*

Buying the Right of Way.—The right of way has been obtained by the Spring Valley mining company through the lands of parties living west of Bigge', for the purpose of digging a canal to carry off the water and earth sent down from the mines, and also the large volume of water that comes in this side of Cherokee from the different ravines during the winter season. The company are doing all in their power to save these lands from destruction. They have bought a great many farms along Dry creek, and this step is now taken to save the rest.

Montana Mining Matters.

The *New Northwest* says: The yield of the placer mines of this county the present season will not vary much from eight hundred thousand dollars. This is a decrease of at least one-third below the yield of last year, according to the judgment of the bankers of this city. The falling off is due partially to the short mining season of 1874, the scarcity of water in many of the camps and to the additional fact that the rich mines of Pioneer and that vicinity have not paid in their usual tribute. Some of the old mines which have steadily poured out their golden treasures for the past four years, are becoming worked out, or at least the richest streaks have been mined. Much prospecting has been done during the summer and not without beneficial results. New and valuable strikes have been made, and are now being developed, both in the lower and upper ends of the county, that will next year give a new impetus to the placer gold yield of this section. The introduction of new hydraulic mining machinery, with greater capacity for mining large breasts of less than wages diggings by the old process, will also materially assist to increase the yield. We refer to the introduction of the Little Giants, the superiority of which has been so successfully proven the present season. The silver and gold yield from quartz, although not brought so prominently to notice, will be far greater this year than last. This yield will be largely, if not almost wholly, from shipments of ore to San Francisco and Swansea, Wales, for reduction or sale in the rough; for humiliating as it may be, it is an indisputable fact that our mills are still incompetent to successfully ornsh ores, and our mill men have not yet satisfactorily to themselves, even, solved the question as to the most economical and successful method of treating the various grades of ore found in the different quartz districts. Although the progress of milling operations has been much slower than had been anticipated, still some improvements have been made, and the appliances for reduction are gradually becoming more perfect. Few shipments have been made during the season that have not paid the shipper a handsome profit on his venture. Owners in the Vipond and Bryant silver districts, though not within the bounds of this county yet properly figuring with the yield of this side, have shipped largely this season and, having thoroughly demonstrated the wisdom of such a course, will next year increase their shipment by many hundred tons. The Philipsburg quartz interests, lying stagnated on account of complicated litigation, in part, and the lack of capital to develop, are now apparently placed on the road to good results by the investment in and the working of the Trout mine by the heavy capitalists of the Northwest company. The rich Cable mine is surely, if slowly, unwinding itself from the legal network which the courts have built around it, and may be looked upon as no distant aid to the annual gold yield. Taking a general survey of the mining prospects of Deer Lodge for 1875, the indications are all favorable to an improvement upon the present season.

Mining in Yavapai and Mohave.

The *Arizona Citizen* learns from Gov. Safford, who has recently visited Yavapai and Mohave counties, that the mining interest thereaways has never looked so prosperous as now. From $10,000 to $15,000 in gold per week is being sold at Prescott. It is mostly taken from ore crushed in arrastras, and men who had little or no means own these arrastras. Notably among the successful ones in quartz mining are Fredericke & Co., and the owners of the Gen. Crook lode. Fredericks & Co. have paid the expenses of opening their mine from its proceeds and purchased thereby machinery for reducing the ores, and the owners of the Gen. Crook have a large quantity of very rich ore in sight. A. O. Noyes has a fine mill ready to run; C. C. Hitchcock has a number of men at work at Big Bug, and his prospects are very flattering. Jackson & Co. have been troubled a good deal for want of water to run their mill, but their mines never looked better. No work has been done recently on the Tiger, but the company have 700 tons of ore at the dump that assays over $100 per ton, and the lode is from 15 to 35 feet thick and glistens with native silver. Smith's mill below Wickenburg is doing very well. It daily crushes from 15 to 20 tons of ore, which pays well.

In Mohave county several new and rich discoveries have been made, principal among them being the Owen lode, which promises to be one of the most remarkable ever made on the Pacific coast. Thousands of tons are found on the surface, which will assay $100 per ton and upwards. In Cedar district the Hope, Arnold, Billy Ingle and Echo are showing very well, and considerable work is being done on them. At Mineral Park the Keystone company is sinking a shaft on its lode, which is now down 180 ft., at the bottom of which they find 4 ft. of ore worth from $100 to $500 per ton. The Lone Star company, a short distance above the Keystone, is working with good prospects. Near Cerbat, the "'63" company is taking out very rich ore and shipping it to San Francisco, and work was about to commence on the Little Tiger.

The Savage mining company intend to put in a monstrous engine, erect new buildings, and sink a shaft 4,000 feet into the bowels of the Comatock lode

Salmon Hatching.

John Muir, the mountaineer geologist, has made a tour this year through the foothills of the Sierra, and his wanderings having brought him to the McCloud river, he writes an interesting account of the fish breeding establishments there. In 1873, one and a half million of eggs were procured and shipped; this year 5,752,500 eggs were obtained and distributed over the United States, while 25,000 eggs were sent to New Zealand. Of the operations Mr. Muir writes as follows:

Toward the end of August the McCloud river salmon are ready to spawn, and are then seen pushing their way up toward the sources of the river to deposit it. Mr. Stone has constructed a salmon dam at this place which stretches across the river from bank to bank. In front of this dam the salmon collect in great numbers, and keep up a constant plashing in their efforts to leap over it. Most of them are unsuccessful, and fall back wearied and glad to rest in the first slow-currented eddy. This eddy is a few yards below the dam, and here the tired salmon are captured, and the eggs stripped from them into suitable vessels. The eggs are then impregnated by pressing the milt of the male salmon upon them, and stirring them gently, so as to bring every egg in contact with it. The eggs, thus artificially spawned and artificially fecundated, are then placed in troughs through which a stream of pure water, carefully filtered, is kept flowing. The eggs measure about ¼ of an inch in diameter—are pink in color, and look like ripe currants. After they have been in the hatching-troughs about 16 days the eye-spots of the coming salmonets begin to appear, and they are now ready for shipment. They are packed in boxes, in layers spread upon mosquito netting, between layers of green, living moss, and these boxes are packed in crates with ice, to keep them cool. In this way, with adequate care and skill in handling, they may be sent safely by ship, wagon or rail, to great distances. After arriving at their destination, they are replaced in hatching-troughs similar to those from whence they were taken, and the hatching process continued until the young fry break the shell and swim. In procuring the 5,752,500 eggs mentioned above, about 5,000 salmon were taken, more than half of which were males.

Thus it will be seen that the berry-like eggs or seeds are stripped from the salmon like peas from a pod. The empty fish husks average about fifteen pounds, and fall to the share of the Indians, who dry them for winter. It is supposed that all salmon die after yielding their spawn even in the natural way. This destruction, therefore, of so many handsome fish legumes need not be deplored. Here the question is sure to rise, Why not capture the breeding salmon and transport them alive to the waters where they are wanted, and allow them to spawn and hatch in their own natural way? Before the discovery of artificial fecundation by Jacobi, this method was the only one known and is still in practice to some extent. The trontless streams that rush out from cool cañons of the Sierra in the Owen's river valley were stocked last year by a German, who packed trout in cans on the backs of mules from the King's river, Yosemite, over a pass of 12,000 feet hight. But this more natural method is too slow. Nature does not seem to think of hatching more than one or two in a hundred of the eggs that are spawned, whereas Mr. Stone hatches more than ninety-five per cent. by the artificial method. In every hundred, Nature gives one to the frog, one to the mink, one to the snake, and one to the water ousel, etc., and hatches one into a salmon. In like manner the nut-eggs of pine trees, contained in burrs, are sufficient for the food of many a bird and squirrel as well as for the wants of reproduction.

Artificial destruction has made lakes and rivers as barren as deserts, so far as fish-food is concerned. Prior to the gold period the Tuolumne abounded in salmon, but the mud of mining destroyed them, or drove them away. The Connecticut was also a salmon stream until obstructed by dams, and poisoned by those strangely-complicated filths for which our civilization is peculiar. When fish-ladders are constructed over dams and the sewage of towns and factories is consumed upon the land instead of being poured into the water, leaving paths from the ocean to the spawning grounds free and clean, then our migratory food fishes, such as the shad and salmon, will again become abundant, and that ere long, provided artificial destructions be compensated by artificial reproductions.

Fish may be tamed, and many engage in their culture for the novelty of the thing, or for a natural love of playing and choring in an ichthyological atmosphere, but Stone and his fishy co-workers mean bread and business, and their practical success, considering the infancy of the piscicultural art and the magnitude of the obstacles which had to be overcome, is truly remarkable.

Besides the hatching and distribution of McCloud salmon ova, Commissioner Stone brought shad, bass, whitefish, eels, horn pouts and oysters from the East mostly for the fructification of California waters. The first aquarium car destined for this State tumbled through the railroad trestlework into the Elkhorn river with all its precious fry, much to the discomfiture of Commissioner Stone, who had not the slightest intention of thus casting his shad upon the waters, though some may grow and be found again after many days.

Nearly a million of the eggs taken here this season have been fully hatched and turned into the McCloud river, from whence they were derived, and for this host of wriggling fry the State of California pays the Commission $1,000.

The eggs hatch out into finned fishes in about fifty days, more or less, according to the temperature of the water. When they break the shell they seem eager to try life, and immediately ply their fins. They are then only half an inch long, frail and semi-transparent, and utterly incapable of gaining an independent living; but nature makes that all right by providing each youngling with a bag of provisions big enough to last six or seven weeks, and at the end of this period they are grown sufficiently strong to shift for themselves. Their provision sacks are twice as heavy and bulky as their bodies, and they cannot swim far with them at a time. In resting they frequently lean back or lie down upon their provisions, just as mountaineers do when weary and heavy laden. Long may McCloud salmon swim.

Steel for Cannon.—The *Revue d' Artillerie*, published by order of the Minister of War, in France, contains the report of Major Bobillier, of the artillery, on the experiments made last year, at Creusot, in steel for the construction of cannon. The object of M. Schneider was, of course, to produce a metal that should be free from the faults both of cast iron and bronze, and according to the report this object has been obtained, for in the words of a communication made by General Morin to the Paris Academy of Sciences on the last day of August, "On the one hand accidents like those which caused the Russian government to reject a whole material of artillery from the famous establishment of Essen are not to be feared with the soft steel tried at Creusot; and, on the other, the three pieces of 78 m. 6 mm. (310 inches), experimented on supported without reaching the limit of their power of resistance, and without being deformed nearly as much as bronze would have been under the same circumstances, the most severe trials, and to which guns of that calibre are never submitted in ordinary service." The experiments are still being pushed, but General Morin told the academy that it might be safely asserted that the establishment at Creusot possessed the necessary elements for the production of cannons in steel with all the qualities demanded for artillery, namely, resistance against fracture and deformation.

South Mountain.

To-day the first consignment of base bullion from South Mountain mining district, Idaho territory, arrived in Winnemucca. It consists of 30,300 pounds, and was brought down by G. W. Baker, who has been engaged extensively in the freighting business from Winnemucca to Idaho for several years, and whose teams were the first to enter South Mountain district with large freight wagons. From Mr. Baker, who arrived in town yesterday direct from the mines, we learn the following relative to South mountain. The district is situated thirty-five miles south of Silver City, Idaho territory, and 150 miles north from Winnemucca, in a direct line between the two places. There is considerable timber in the immediate vicinity of the mines, and thirty miles from the district the supply of that indispensable article is practically inexhaustible. Three months ago the South Mountain Mining and Smelting company was incorporated in San Francisco for the purpose of mining and smelting in the district. The company went to work with a will, and within ninety days had a furnace in full blast on ore from the Bay State mine, and over 15 tons of bullion at the depot in Winnemucca. The capacity of the furnace is sufficient to produce on an average 7,000 pounds of bullion daily. Two more furnaces of greater capacity are now in course of erection, and the quantity of ore in sight is sufficient to run them for an unlimited length of time. Our informant says that experienced mining men from Salt Lake and Eureka who have examined the mines are confident that they are equal in richness and extent to the famous mines of those localities. He is also of the opinion that when the district is more thoroughly developed, and the furnaces now being built are in full blast, every pound of freight for Idaho territory will leave the railroad at Winnemucca, as teamsters will always have back freight from South mountain. The success of this smelting enterprise, which is now practically demonstrated, will add greatly to the prosperity of Winnemucca, and to its importance as a shipping point for the whole northern country.—*Reese River Reveille.*

The two furnaces erected by C. A. Luckhardt for the California Borax company, at Sulphur Banks, Lake county, are proving quite a success. They produce daily from the lowest grade ore twelve to fifteen flasks of quicksilver. Mr. Luckhart is about to erect some of his furnaces at the American and other quicksilver mines.

Quicksilver.—The quicksilver prospectors in the coast range of this county, says the Stanislaus *News*, are still sanguine. Many are taking the necessary steps to locate and prove up on their claims in accordance with the laws of Congress. This done, we may expect to hear of work being done to develop and improve claims.

SCIENTIFIC PROGRESS.

Singular Effect of Great Heat—Fire Proof Construction.

Before entering upon the consideration of what arrangements of buildiug are best calcnlated to resist fire, it is advisablo to give some further data of the actions of fire npon other snbstancos than those mentioned in onr la t issno.

After the great fire at Hamborg some 30 years ago, Dr. Zimmerman, an accnrate and truthful observer, wrote an accoont of the effects prodnced by the great conflagration npon various materials. He says, "There were bricks, the snrfaces of which were fnsed and thns coated with enamel. Lime had become brittle and loose, and re-acquired its caustic property. Pieces of granite bnrst into fragments, and the surface of many square stones separated into thin layers. The bells were partially fnsed, at the same time becoming oxidated and forming a slag and red copper ore.

A portion of the fnsed metal broke through tha vaults and entered the sepulchers, coating and filling the skulls and bones with metal. The bell metal nnderwent a partial refining, the tin being separated by fnsion and the copper left behind in a porous state. Steel became soft and condensed by flowing into a thick mass. Iron, after being fnsed, formed a slag and changed into a graphite-like substance, or even into magnetic ironstone which was found in the shape of crystalline octahedra. Glass was frequently fused into a kind of enamel, bnt sometimes it was only fritted and received a crystalline appearance. A magazine of blue paper was entirely destroyed, bnt the smalt was left behind without nndergoing any change and fonnd afterwards fnsed together into a lump. The greater part of the large store of minerals belonging to Messrs. Abel, the great manufacturing chemist, was destroyed, being fused or fritted, especially the metallic minerals. Cobalt alone was able to resist the intense heat, and the smalt had partially become harder and bright in snch portions where it was glazed or changed into a black carbonaceous sabstance. The sparry iron ore had preserved its crystalline form; bnt was transformed into brown iron ore; the green iron ore had undergone the process of fnsion, but still preserved its peculiar color. All the magnesian minerals resisted the red-heat; garnets and opals remained unchanged; the iron garnet however, lost its brightness and assnmed a yellow-brown color. The diamonds were either entirely bnrnt or had become opaque and smaller. Black mica and chlorite schist became of a golden yellow and silicious standstone was changed into opal; clay into porcelain jasper; flints became white-fused with iron into a breccia or were coated with a green enamel. A remarkable circnmstance was that the footpaths and roofs covered with asphalte did not ignite, and that the gronnd underneath the smouldering rnins, for a whole fortnight —in some instances for eight weeks, or even three months—was so little affected by the heat, that an ice cellar was found filled with undissolved ice."

This last, apparently incredible, circnmstance is endorsed by another able writer.—*Architect.*

VARIABILITY OF THE SUN'S DIAMETER.—The disagreement in the observations of the diameter of the snn, made by different astronomers, has thns far been ascribed to faults in the instruments or errors by the observers; but P. Rosa, assistant at the observatory of the Roman College, after having corrected those discrepancies which were the results of errors, finds that different observations with instruments which give for the diameter of the moon a constant quantity, give different diameters for the snn at different times, while the errors of observers or instrnmenta are easily determined by comparing the simultaneons observations made in different localities. When comparing the observations made from 1750 to 1870, it becomes evident that the sun's diameter is really variable, and the qnestion arises: Is it the photosphere which changes its size or form, or is it the influence of the solar heat in the instrnmenta? The last supposition P. Rosa thinks highly improbable, and he adheres to the first—the reality of a variation in the sun itself. Even as our little moon exerts an influence on our ocean, by prodncing the tides, and thus changes the shape of the liquid of our terrestrial snrface, so the large planets Jupiter and Satnrn cause a kind of tidal wave in the gaseous photosphere, and probably even on the liqnid nucleus of the snn, and in altering the form may contribnte somewhat in elongating and shortening some of its diameters.—*Ex.*

TRIUMPHS OF SCIENCE.—A candle 13,000 ft. distant shines with a light 20,000 times more brilliant than do some nebulæ. Yet the constitution of these nebulæ have been determined; and are found to consist of hydrogen and nitrogen. We know the nature of worlds situated at distance inconceivable! And the relative ages of the stars we know. The white stars are the hottest and youngest. The yellow stars, including our sun, are older; while the colored stars are not so hot, and are still older.

A NEW LAMP.—A new lamp has been patented for taking photographs at night, in which bisulphide of carbon is burned on oxide of nitrogen. It is said to be eqnal to sunlight in its effects and intensity.

Purification of Water by Contact with Iron.

Almost all large water pipes are of iron, as tax payers well know when they are called upon to replace the old rusty mains with new ones every few years. Bnt, according to good chemical authority, the iron has an advantage with its defects. Professor Medlock proved by analysis, several years ago, that iron by its action on nitrogenous organic matter produces nitrous acid, which Mnspratt called "Nature's scavenger." The latter chemist found, as a general result, that, by allowing water to be in contact with a large surface of iron, in about 48 hours every trace of organic matter was either destroyed or rendered insoluble, in which state it could be purified effectually by filtration. Medlock found, on examining the water at Amsterdam, which smelt and tasted badly, that the sediment charred on ignition, and was almost consumed, showing that it consisted of organic matter. He also found that water, instead of taking iron from the service pipes, before entering them contained nearly half a grain of iron to the gallon; while in the water issuing from the pipes, there was only an unweighable trace. Before entering the reservoir, the water holding iron in solution formed no deposits; while the water coming from the pipes, and freed from iron gave organic sediment above mentioned. He then made analysis of water brought in contact with iron, and water not in contact, with the result that the water which had not touched iron contained 2.10 grains of organic] matter, and 0.96 grain iron; the other gave only a slight trace of both, showing plainly that the organic matter in the water was either decomposed or thrown down by contact with iron; and this water, when filtered, was found to be clear, of good taste, with no smell, and free from organic matter. It is not stated in what shape the iron was held in solution, but it was probably in that of carbonate, the usual iron salt of springs, since carbonic acid is so common in water in general.

These facts may be made useful in certain places and ways in effecting the purification of water rendered injurious and offensive by the presence of organic substances. And if the interiors of iron mains could only be kept from rusting by a swabbing with nitric acid, or by a paint of charcoal and plumbago, so much the cheaper.—*Ex.*

WHITWORTH STEEL.—Some idea of the solidity of compressed castings of Whitworth metal may be gleaned from the fact that, five minutes after the application of pressnre—about twenty tons to the square inch—a column of fluid steel becomes shorter by 12.5 per cent., or 1¼ inches to the foot. Sir Joseph Whitworth, as a writer in *Iron* states, holds the proportion that for certain purposes a metal must be used having a certain ductility. Hence the metal cast at the Whitworth works is classified according to its possession of these qualities, and arranged for convenience in four groups, distinguished by colors, red, blue, brown and yellow, and by numbers, No. 1 of each group representing the most ductile metal, and No. 3 the least so. Various samples of Whitworth steel tested gave from 36 to 72 tons tensile-streogth, and from 33·3 to 14 per cent. elongation. There is shown a singular relation between the tensile strength and ductility of metal, the one generally increasing as the other decreases, a circumstance which, it is suggested, may possibly deserve investigation.

THE VIBATORY NOTE.—It ia well known that in order to enable processions to safely cross large suspension bridges, it is necessary that they should break step in order to insure safety; and it is told, in illustration, that when the first suspension bridge was built in England, a fiddler offered to demolish it with his fiddle. Striking one note after another, he eventually hit the vibrating note or fundamental tone, and threw the structure into extraordinary vibrations. It is said that a bridge once went down in France under the tread of a regiment of infantry who neglected to break step on entering it, and that many persons were drowned. The experiment of breaking a tumbler or other glass vessels by frequent repetitions of some particular note of the human voice belongs to the same class of phenomena.

A NEW AMERICAN BAROMETER.—At the August meeting of the American Association at Hartford, a paper was read by Prof. B. S. Hedrick, describing "An Improvement on Descartes' Barometer;" referring to an instrument containing mercury and heavy petroleum, which boils at about 300°, the tube being enlarged above the position of the mercury, so that the light liquid on top exhibits all changes very readily, and is plainly visible even at some distance.

PUTREFACTION.—Meat does not oxidize or putrefy in compressed air, though it undergoes changes of color, texture and flavor. Certain fermentations may be arrested by oxygen at a high pressure. Wines may be prevented from undergoing the acetous fermentation by the action of compressed air.—*M. Paul Bert, in Les Mondes.*

PYROMETERS.—It appears from a report of a committee of the British Association of Science charged with examination of the above instruments, that, by means of the Siemens electric electric pyrometer, changes of resistance amounting to about 1-10,000 of the quantity of heat to be measured can be detected without much difficulty.

MECHANICAL PROGRESS.

Greasy Water in Steam Boilers.

This subject was recently discussed before the Society of Engineers in Aix-la-Chapelle. Lamberts remarked in the course of the discussion that in hundreds of cases the use of greasy water has caused a corrosion of the plates of iron used in constructing the boiler, and that it ceased at once on feeding the boiler with fresh well water. On that ground the construction of heaters in which the water come into direct contact with the exhaust was inferior to the indirect acting through a metal diaphragm. In the first a great part of the oil employed for lubricating the cylinder got into the boiler.

Boecking laid stress on the fact that in innumerable cases no injury could be proven to have been done by the condensation water at least. Buettner was of the opinion that the action of the grease was due to its adhering to the metal and isolating it from the water, so as to expose it to overheating on the side exposed to the fire, since the chemical action of the fatty acids was too weak to be injurious. If we undertake to saponify the fat with soda, we have the disadvantage that the water foams a great deal, and the steam produced carries a great deal of water with it. Dr. Stahlschmidt declared that from a medical standpoint the various undoubted proofs of the injurious effects of grease are a riddle. In the distillation of paraffine, kettles are employed which are in contact with fatty acids from year to year, and yet they last a long time. It is desirable that scientific experimenta be made on real steam boilers to explain this phenomenon.

Lamberts remarked that the injurious effect of greasy water was experienced to a greater extent in South Germany, where the water frequently contained magnesia, which substance is contained to a much slighter extent in waters of the Rhine. The fatty acids form with magnesia a totally insoluble soap. By making the experiment on a small scale a white powder will be seen floating on the water, and on putting the finger into the water, this powder envelops the finger and protects it from being wetted. Magnesia, even when the water is not greasy, has an injurious effect, as experience has proven in the case of waters which contained much carbonate of magnesia.

G. Piedbœu, on the contrary, claimed that without any grease the carbonate of lime and magnesia did no injury. As soon, however, as any grease gets in it, a precipitate is formed, which attaches itself to the sides of the boiler, and prevents the water touching it, thus exposing it to the destructive action of the fire. In such cases the evil is at once overcome by taking the water direct from a well or spring, no matter how much magnesia it contains, provided it is free from fat and oil. In a steamship boiler, worked with a surface condenser, after a week's use, both fire-lines collapsed simultaneously, although there was plenty of water present. New York engineers had attributed the accident to a want of circulation in the water, and altered the construction of the boiler to that end; but on the return trip the very same thing happened again. To help this soda has been employed, thereby preventing injury from the grease, but producing a violent boiling over. Finally, sea water was principally used for feed, and the boiler was no longer injured by the deposit of grease, but was destroyed by incrustations.

Silica has a totally different effect from the carbonate of lime and magnesia. This, now and then, produced injury in perfectly pure water, especially in mountain streams, by hastening the oxidization of the iron. Von Gizycki stated that after the introduction of surface condensers in ships' engines, they were soon compelled to mix with the distilled and greasy water, from time to time, a small quantity of sea water, and that at first sea water alone should be employed until a protecting crust had been formed. A ship's boiler, where this precaution had been neglected, was destroyed after four weeks' use, and was found to be covered with a deposit of oxide of iron. Another means that has been employed with good results is to frequently let out the boiler water from the surface condenser.—*Ind. Zeit. and Am. Art.*

THE first duty of an engineer, when he enters his boiler room in the morning, is to ascertain how many gauges of water there are in his boiler. Never unbank nor replenish the fires until this is done. Accidents have occurred, and many boilers have been entirely ruined, from neglect of this precaution.—*The Locomotive.*

A 6,000-TON STEAMER FOR THE MISSISSIPPI.—Parties in New Orleans are proposing to build a new style of boat, of iron, three hundred feet long, of six thousand tons capacity, able to run twelve miles an hour either way, with a consumption of less than one hundred tons of coal in a round trip from St. Louis.

IT is not alone in the United States that steel rails are growing in favor to the exclusion of iron. All of the contracts lately given out by the Belgian government for the State lines are for steel. These amount to no less than 29,000 tons.

Portable Fire Walls.

While a thousand plans are being devised as safeguards in time of great conflagrations, the following suggestion from the Chicago *Manufacturer* commends itself as sensible:

What we need, in addition to our other fire apparatus, is a portable fire wall. This wall must be easily transported to a point of exposure, readily erected and thoroughly efficient when placed. The value of such a wall is beyond estimate, and its cost comparatively light. Sheets of iron stiffened with iron frame backs, about 6 ft. wide by 20 ft. long, are hinged together at their sides in such a manner that they will fold right and left and make a compact load, such as would ride snugly upon an iron wagon, like those used for hooks and ladders. Nine of these sheets so joined would form an iron curtain, when extended, 20 ft. wide by 50 ft. high. When needed, say among our highest buildings, several teams, each with such a curtain, would drive rapidly to the point of exposure, and draw up in front, not of the building burning, but of the one exposed. Two of the men in charge would go to the top of the building, and throw down the end of a rope, and draw up and put in place two hooks, like a painter's roof hook, holding tackle blocks, through which would run wire ropes coming from similar blocks below; the lower blocks would then be attached to the upper side of the curtain, and the two horses would be enough to raise the curtain in front of the building. If more than 50 ft. in hight are required, a second curtain could be hooked to the bottom of the first. By the side of the first, others overlapping could be raised until the exposed front was covered. The whole could be braced and ganged. Behind this curtain, separated from it by a wide air space, the building would stand securely while the opposite side of the street or alley burned down; and it would not be even defaced or blackened, or have its glass cracked; nor would the firemen, in keeping it cool, break the windows and deluge the goods within.

To use this fire wall among the lower buildings, lumber yards, mills, etc., an apparatus should be furnished capable of holding it, at the required hight. I prefer a tripod constructed of gas pipe. This would be light to transport and erect, and yet, if well set at the bottom and firmly gauged, it would stand the strain demanded.

I will not occupy your space by dwelling upon details. But if my suggestions seem worth attention, I shall be glad to explain them at length. I am confident that, with such a portable fire wall, fires may be always confined to the spot where they begin; and if, unfortunately, they extend further, this wall will enable the fire department to make a successful stand at any point selected.

SIMPLE AND INGENIOUS DEVICE.—The liability of water-pipes to burst from the effect of frost is one of the most prolific sources of discomfort and expense both in households and in manufacturing establishments, and no effectual safeguard from the evil has hitherto been found. An English inventor now proposes a method which has certainly the merit of ingenuity, and seems well adapted to attain the object aimed at. The increase in bulk of water, in freezing, is about one-twelfth, and the expansive force thus exerted is so powerful that no pipe or vessel yet made can resist it.

But this inventor adroitly avoids the difficulty by passing through the water pipe an India rubber tube of such dimensions that the space inside of it is a little more than the increase in the volume of water in freezing. The rubber tube is kept full of air, its supply being acted upon by the water pressure in such a way that the equality of tension is automatically preserved. When the water in the pipe freezes and expands, the rubber tube simply yields to it and thus gives space for the necessary expansion.

A NEW MECHANICAL SEPARATOR.—A new form of mechanical separator for the removal of fine particles of iron that become mixed with turnings and filings of copper and brass from workshops, has recently been devised by M. Varin, of Paris. Two superposed hollow cylinders turn in the same direction, and upon them the material to be separated is scattered through a hopper. The surface of the cylinders consists in bands of soft iron which are kept in a magnetic state. The particles of iron are attracted to these cylinders, and at a certain period of revolution are brushed therefrom into a receptacle, while the scraps or other metal fall to the bottom of the apparatus. The machine is said to be capable of separating 1,100 pounds of material per hour. It has also recently been employed by M. Mangon, for detecting titanic iron in arable earth with remarkable precision, the iron, in such small quantities as 15 or even 7 grains in 22 pounds of earth, having been readily separated.

THIN SAWS.—It is claimed by some saw makers that there is a great waste of both power and timber in using the thick saws so commonly run, that a saw to cut in the roughest timber should never be heavier than eight gauge, and for walnut and poplar not more than ten or twelve gauge. It is true, doubtless, that sawmill men are generally of the opinion that a thin saw cannot be successfully run; but whether this is due, as is asserted, to a vicious education, fostered by saw makers who had not the ability to make a thin blade, is a question which has two sides probably. At any rate, the advocates of the thin blades say those who test them are satisfied of their superiority.

Obituary.

It becomes onr painful duty to record the desth of onr late ssociate and friend Mr. W. Wadsworth, who died in Sacramento city on Sunday last, after a long aod most painful illness of several months' duration. His disesse was bone cancer at the outlet valve of the etomach, by which that organ wss grsdually closed to all possibilities of performing its appropriate functions, and onr friend was literally starved to death by inches.

Mr. Wadsworth was well known throughout the State as a sterling, energetic business man, and he has passed away at the ripe sge of sixty-three. He was a native of Dnrham, Conn., and although never a politician he was elected, when but twenty-one years of age, a member of the Legislature of his native State, in which cspacity he served two years. His principal record there was the anthorship of what has since become famous as "Wadsworth's Bird Bill." This bill has never yet been erased from the etatnte book of that State, snd was, we believe, the first ever framed in America for the protection of small birds; and of all the acts of his long and useful life none seemed to be reviewed by him with more satisfaction tban this. It has formed the baeis of nearly all the similar bills which have been passed in otber States. Immediately after the expiration of his second term, he removed to Monroe, Michigan, .wbere he entered upon the active dntiee of farming. In going West he took with him all the improved systems of farming, and was the first to introduce into that, then a new country, improved varieties of fruit, suitable for that climate—none but seedlings having previonsly been known there. He also took with him improved farming tools, and soon had the best cnltivated farm in all the "far West."

Just before leaving Michigan for California some twenty years ago, he took the State agricultural premium for having the best cnltivated farm in Miohigan. He reached California at too early a date for entering npon his favorite occupation; and soon after his arrival repaired to Placerville, where he took the editorial charge for a while of the Placerville *Herald*, and aleo acted as engineer in laying out some of the early mining canals in that county. After leaving that locality he returned to this city, where he continned his editorial career for a while on *Hutchings' Magazine*, but chiefly as editor and joint publisher, with Bacon & Co., of the *California Cnlturist*, a mssazine of sterling merit, and one which did much to initiate the trne spirit of farming among the people of California.

He eubsequently went to Sacramento, where he was among the first to point out the possibilities snd importance of sugar beet culture in thie State. He was sent to Europe to pnrchase the machinery for tbe Sacramento sugar beet msnufactory; and if the management of that institution had been permanently kept in his hands, the nnfortunate mistakes which impaired the early history of this important industrial enterprise would never have become a mstter of record.

In November, 1871, Mr. Wadsworth wss invited to a chair in the editorial rooms of the RURAL PRESS, which he continued to fill most acceptably nntil he was compelled to retire by reason of the insidions disease which began to make itself seriously felt about seven months ago. He was one of the ablest writers on agricultural matters in the United States, and it is largely to his pen that the RURAL PRESS owes its popularity and usefulness. As a companion and sesociate, as well as a writer, his loss is most keenly felt in this office. He was a devoted hueband and father, an honorable gentleman and a kind friend to all. He died the death of a Christian, and in his demise the State has lost a most valuable oitizen. During the four or five years past he has made the beet sugar business a specialty, and his knowledge of it was beginning to be justly appreciated. He and his family were largely interested in the factory at Sacramento, and just previons to the last months of his life, some three or four different parties were applicants for his services in the establishment of beet sugarics in as many different portions of tbe State.

Words of onrs will scarcely add to the regret which the friends of Mr. Wadsworth will feel on learning of his death, and we oan only press our sentiments of sorrow for the loss of a kind and generous friend, an able writer and a nseful citizen.—*Pacific Rural Press.*

PANAMINT.—A gentleman just from Pansmint reporte the district in a fever of excitement. The mines a:e developed sufficiently to warrant; the helief that the are very rich. He says that the camp now contains some 700 miners, and more are arriving every day, eome from the Bakersfield route, but most oome by the San Bernsdino route, as it is the cheapest and quickest. Meals can be procnred in Panamint for 75 cente. The town ie filled with saloons, afid gamblers are doing a big business. Building lots command a high price, from $500 to $1,000, and considerable numbers are changing hands at that figure. New bnildings are going up rapidly.

MINING SHAREHOLDERS' DIRECTORY.

Mining Stocks.

Business during the week under review has been confined almost exclusively to the Comstocks. Last week was marked by a steady and severe decline throughout the list, with the exception of Con. Virginia and neighboring mines, which stood up pretty stiffly. The canse of the falling off in prices is understood to be the apprehension which onteide holders had that the market wonld break on or before the 3d inst., the day of the Nevada elections, a story having been circulated that certain stocks said to be carried by Mr. Sharon wonld be then pnt upon the street. The rush to realize cansed a momentary weakness, from which the market hse since recovered. News from the mines continnes very favorable, and is accepted as having good foundation in the facts. The prospects of the Comstock never looked brighter, and although lower figures are looked for a few months hence, the present indications point to a rise.

The Ophir and Con. Virginia ore body proves even richer than wss anticipated. The connections made by the California company are eo far advanced that the extraction of ore will soon commence in earnest. It is expected that in the course of a few months there will be no less than five dividend-paying mines among the Comstocks as long as the Belcher and Crown Point bonanza holds out. The Best and Beloher company have purchased a valnable tract of ground from Gou'd & Curry, to be paid for in a stock dividend. The capital stock of the Best & Belcher company is now 100,800 shares. Of this 48,000 shares are due the Gonld & Curry company for 321 feet of the r gronnd; 50,400 shares will be issued to the holders of Best & Belcher stock, in the proportion of 2¼ shares of new stock for each and every share of old stock eurrendered—to wit: 22,400 shares by 2¼ equals 50,400—and the remaining 2,400 shares will belong to the Best & Belcher company and will be nsed for a working capital

There has been a considerable movement in Overman and cognate stocks. The latest upheaval will probably be in Baltimore Consolidated, a mine which was once a favorite, but which has latterly been neglected by buyers. The stock is very firmly held and is steadily advancing.

Ae intimated, bnt little attention has been turned to Pioche, Eureka, Idaho and California stocks, and they have suffered accordingly. It is noticeable that outside mining districts attract but little speonlation while an excitement in Virginia and Gold Hill exists.

We give a table of sales made one week ago, by which to compare present qnotations.

New Incorporations.

The following compsnies have filed certificates of incorporation in the County Olerk's Office, San Francisco:

THE CARSON HILL M. CO.—Oct. 30th. Location: Carson Hill, Calaveras county, California. Directors are H. D. Bacon, Thomas Brown, Chas. T. Botts, Wm. Irvine and Robert Irvine. Capital stock, $2,000,000, divided into 20,000 shares.

COMSTOCK S. M. CO.—Nov. 3d. Location: Pansmint Mining District, Inyo county, California. Directors: James A. Pritchard, J. D. Fry, B. Peart, S. A. Raymond and Joseph McGillivray. Capital stock, $6,000,000, divided into 60,000 shares.

LITTLE BLUE S. M. CO.—Nov. 3d. Location: Panamint Mining District, Inyo county, California. Directors: James A. Pritchard, J. D. Fry, B. Peart, S. A. Raymond and Joseph McGillivray. Capital stock, $6,000,000, divided into 60,000 shares.

SILVER BELT S. M. CO.—Nov. 3d. Location: Panamint Mining District, Inyo county, California. Directors, James A. Pritchard, J. D. Fry, B. Peart, S. A. Raymond and Joseph McGillivray. Capital stock, $6,000,000, divided into 60,000 shares.

ESPERANZA S. M. CO.—Nov. 3d. Location: Panamint Mining District, Inyo county California. Directors: James A. Pritchard, J. D. Fry, B. Peart, S. A. Raymond and Joseph McGillivray. Capital stock, $6,000,000, divided into 60,000 shares.

SUPERIOR CANON TOLL ROAD CO.—Object, to build a toll road in Surgise valley, Panamint district. Directors: James A. Pritchard, J. D. Fry, B. Peart, S. A. Raymond and Joseph McGilliwray. Capital stock, $1,000,000, divided into 10,000 shares.

EUREKA VENTILATION CO.—Nov. 3d. Object, to manufacture and sell ventilators. Directors: Charles J. Smith, Joseph E. Smiley, John D. Cusbeon, George E. Carter and Edwin W. Woodward. Capital stock, $300,000, divided into 3,000 shares.

BLACK HAWK COAL M. CO.—Oct. 2d. Location: Murray township, Alameda county. Directors: John P. Jones, W. A. Bechtel, A. D. Kiborn, John Keyer and C. L. Manning. Capital stock, $2,000,000, divided into 60,000 shares.

LIVERMORE G. & S. M. & M. CO.—Oct. 3d. Location, Calaveras county. Capital stock, $2,600,000, divided into 26,000 shares of $100 each. Principal place of business, Oakland, Alameda county. Trustees: A. A. Moore, J. A. Neal, Hiram Bailey, Newton Ingram and W. M. Mendenhall.

MARIPOSA LAND AND MINING CO.—The objects of the Association are to acquire the land and appurtenances known as Los Mariposas, situated in Mariposa county; to irrigate the same; to lease and convey the same in parcels or otherwise; to develop and work the mines and lodes of precious and other metals and minerals known to exist there, and generally make such property useful and productive. The principal place of business will be San Francisco. Directors: E. W. Burr, of San Francisco; S. Heydenfe dt, of San Francisco; William H. Patterson, of San Francisco; Chauncy Vibbard, of New York; and Mark Brumagim, of New York. Capital stock, $15,000,000, divided into 160,000 shares of $100 each.

San Francisco Stock Market.

MINING SUMMARY.

THE following is mostly condensed from journals pnb lished in the interior, in proximity to the mines mentioned.

California.

AMADOR COUNTY.

LIVERMORE COAL MINE.—*Enterprise*, Oct. 31: We have seen a sample of the recent vein of coal which was struck on the drift at 125 feet from the main shaft. It has a very black and glossy appearance and is more compact and heavy than the sample we had here some weeks siuce. The stratum from whioh it was taken is about 15 inches in width and dipe from sonth to north, and has every indication of being near the main vein. The snperintendent and workmen feel confident of reaching the main vein within 25 feet. Considerable coal has already been taken out, and Mr. Harris thinks he will be able to supply the local demand in a few days. The work is progressing finely and the owners are determined to push matters.

CALAVERAS COUNTY.

FAIR YIELD.—Calaveras *Chronicle*, Oct. 31: Fifty-seven tons of quartz, taken from the mine of Lewis, Smith & Willet, at Mosquito, yielded 42 ounces of retorted gold. Richer rock has been crushed, of course, but we call that a pretty good averse yield for nnassorted quartz. It shows, also, that the upper conntry is alive and productive, a fact that is worth telling in these times. The rock was milled at Garland's.

DITCH BAOKE.—The Mokelnmne Hill Water company's canal broke, Monday last, a short distance below the dam across the river where the water ie taken out. The inconvenience consequent npon the "break" was of short duration, however, as damages were speedily repaired. There ie now an abundant supply of water all along the line of the ditch, from inlet to outlet.

West Point District.—A splendid body of ore has been struck in the Josephine. The quartz shows considerable free gold and is said to be five feet thick. Work on the new tunnel at the Good Faith is being pushed lively. The superintendent of the Mina Rica is busily engaged at rebuilding the old Belcher mill. The battery will consist of 8 stamps, 2 Wheeler pans, a large Hepburn settler and other appliances for the manipulation of the rich sulphurets for which the Mina Rica is noted. The milling machinery will be driven by a large overshot wheel; the whole to be in running order by the 1st of December. The company intend to erect a 20-stamp mill early next spring. About 1,500 tons of milling ore ready for stoping in the mine; 200 tons on the dumps. The tunnel of the Valentine shows in its face 18 inches of fair milling ore. Sinking shaft. Miller & Co. are erecting a new mill at the old Oro Plata mill-site to crush the ore from their mine at Anderson's Flat. Two tunnels are being run on the Pancho.

EL DORADO COUNTY.

The Big Blast.—*Mountain Democrat*, Oct. 31: Last Friday afternoon many of our citizens gathered in the vicinity of the Excelsior claim, Coon Hollow, to witness a blast of 170 kegs, 4,250 pounds, of black powder. This powder was placed in a 60-ft. tunnel, with a 30-ft. "T," making a total distance of 90 ft. from the face of the bank, which in the center is about 130 ft. high, of which about one-third is a lava stratum, overlaid with mountain gravel, and a cement of volcanic origin. The fuse was lighted at precisely five o'clock, and in just 15 minutes the blast exploded, producing but little sound, though a large section of the face was thrown down, and the entire hill seamed and lacerated up for a considerable distance. In proportion to the quantity of powder used, it was the most successful blast of the kind that we have ever witnessed. We have seen blasts in which 300 kegs of powder were used, and in far less tenacious ground, and the execution was not to be compared with that of the Excelsior blast of last Friday. We very much doubt whether, even with the complete hydraulic apparatus which they possess, the El Dorado water and deep gravel mining company will be able during the entire winter to pipe off the dirt thrown down and loosened by this single blast. We should like to see an experiment with a shaft to the lava stratum and a blast of nitro-glycerine in the Excelsior claim. We are confident that it would be more thorough in its pulverization.

NAPA COUNTY.

Chiles Valley Iron.—Napa *Register*, Oct 31: C. B. Sharp says he will soon commence building a road on which to haul the ore taken from the iron mine on his place in Chiles valley, expecting to commence the hauling of some two hundred tons that is to be delivered this winter, in about three weeks.

On Monday last eight bars of silver, from the Calistoga mine, passed through here in charge of W. E. Robinson, Wells, Fargo & Co.'s messenger, which were estimated as being worth $10,000.

NEVADA COUNTY.

Providence Mine.—*Transcript*, Oct. 31: In the 600-ft. level of the Providence mine the ledge is supposed to be of the usual width. A cross-cut has been run about 20 ft. on the ledge and no foot wall found. The ledge on the upper levels is from 40 to 50 ft. wide, and it is probably the same in this level. The twenty stamps at the mill are kept at work steadily, night and day, on the ore raised. The sulphurets works recently erected are kept busy and work to a charm. Everything around the mine is in a satisfactory condition.

Empire Mine.—Grass Valley *Union*, Oct. 31: This mine has been improving in underground appearance during the month. The yield in gold has been about $14,000, with a splendid prospect of doing better in the future, and for an indefinite period.

Howard Hill Mine.—We understand that the Howard Hill mine, near this place, is soon to be worked again.

Perrin's Mill.—Perrin's mill, engaged in crushing rock from the Slate Ledge mine, broke a pinion four days ago and has been idle since then. Everthing will be repaired by Monday morning next, and the stamps will then be set at at work.

The Omaha Mine.—This mine is making a fine showing at the present time. Thursday last very fine specimen rock was taken out of the bottom of the shaft at a depth of about 280 ft. on the incline. The ledge at that depth is over two feet thick, is strong and solid and is between beautiful walls.

At Moore's Flat, says the *Foothill Tidings* of the 25th, the Illinois company, after a six weeks' run, cleaned up $12,000, and the Blue Bank cleaned up nearly $12,000 after a short run. Others have done well.

At Willow valley, the Blue Ledge, a recent location, and the Montana are being prospected, with favorable symptoms of becoming valuable mines.

The Oriental, a custom quartz mill near Nevada, has worked about 1,000 tons of rock the past summer, from the various prospect claims in the vicinity, and the average value per ton has been about $25.

An accidental discovery of a quartz ledge, while washing surface dirt, now known as McCormick ledge, near Nevada city, has turned out 160 tons of rock during the season, which worked about $25 a ton.

The Murchie mines will both be turning out rock for the mill soon and it is thought keep it running. The Lone Star is now furnishing good rock but the Independence has not yet recovered from the effects of a cave which took place about three months since.

Cheap Mining.—It costs a heap of money sometimes to break up and throw down an acre of gravel banks. The heavy rains of Monday and Tuesday had the effect to soak and cave off about an acre of the Manzanita ground on the west side of the claims, tumbling it down nicely, ready for hydraulicing when sufficient water is in the ditches.

PLACER COUNTY.

Rich Strike.—Placer *Herald*, Oct. 31: Just now, while the Booth, the Julian, the Crater, the Green and the St. Lawrence mines are running on a good sound basis, with good results, or encouraging prospects, we hear of the discovery of another ledge, which, so far, promises to equal the best. Last week Charles Robinson, an old quartz miner in this section, discovered a ledge below Auburn, so rich, our informant tells us, that they pounded out about $200 in less than a day, with a hand mortar.

The St. Patrick.—The Crater Hill mine of the St. Patrick company is looking much better than it has recently, and work is progressing favorably under Greenwell, the new Superintendent.

Iowa Hill.—Cor. *Argus*, Oct. 31: Every one is busy fitting up their claims for winter, with the expectation of the coming season being the most prosperous one that this community has seen for many years and from present indications it certainly will be. The Mountain Gate company's main tunnel at Damascus is at present over a mile in length, and the farther they advance into the main divide, the richer the gravel becomes. The monthly dividends, which have been large, keep steadily increasing and a man that owns a share in the claim at the present time is considered fortunate. The Iowa Hill Canal company have been pushing their work to completion, and although they will not finish the present fall, enough has been done to insure a good supply of water the coming winter.

The Julian Mine.—*Herald*, Oct. 31: Mr. C. H. Schnabel, the owner, has recently erected a fine 20 stamp mill near the mine. Since the completion of the mill he has had a force of about 15 men in the mine extracting ore. They have now a few tons of ore, but the mill will not be set in motion until a sufficient force can be obtained to take out rock enought to keep the mill running.

SONOMA COUNTY.

The Mines near Windsor.—Petaluma *Argus*, Oct. 30: We learn from J. L. Dinwiddie that work on the Olive Gold, Silver and Copper Mining company's mine is being rapidly pushed ahead. The mine is located about five miles from Windsor. On Saturday last some ore was taken out that will assay 80 per cent. copper. The vein is about four feet wide and well defined. About 10 tons of rock are now upon the dumps, and the work will be continued during the winter. The company will erect a smelting furnace in the spring.

Occidental Mine.—We have received from James E. Fowler some specimens of cinnabar from the Occidental mine, in Green Valley, three miles from Bloomfield. They were taken out fifteen feet below the surface, and contain 2½ per cent. of quicksilver.

STANISLAUS COUNTY.

Catching the Fever.—Stanislaus *News*, Oct. 30: At last the cinnabar and silver fever has extended to Modesto. We understand that a company has been formed in this place with the view of prospecting claims located by members of the company, in the Coast Range east of Grayson. Many men are now already at work in these mountains, and some excellent croppings of cinnabar have been discovered. If mines are discovered it will certainly be a great addition to the wealth of the county.

TULARE COUNTY.

Smelting Works.—Tulare *Times*, Oct. 31: Mr. J. W. Brown, of Antioch, left this place last Thursday morning for the Mineral King mines. Mr. Brown is highly pleased with the specimens from there, and he is now visiting the district with the intention of erecting smelting works. It is the calculation to haul the machinery as far as possible this fall, on wagons, and transport it the rest of the way on sleds, on the snow, during the winter.

TUOLUMNE COUNTY.

New Claims Being Opened.—Tuolumne *Independent*, Oct. 31: Messrs. Nelson, Trout and others are about to start in the old San Juan tunnel in Table Mountain, to work the Nelson ground. About 200 feet of the old tunnel is good and the remaining portion badly caved.

Mons. Mounefoi & Co. are re-opening the tunnel ground between the "Empire" and the "Buckeye," T. M., and expect large results.

On Monday the water company commenced to clean up the Columbia Gulch flume, employing from 10 to 24 men each day. As it was expected to take but four or five days, the job is probably completed.

Mine Mining Improvements.—The Golden Gate company are making arrangements for an addition of ten more stamps. Superintendent Gleason has let a contract to sink another fifty feet in the tunnel shaft—which, when completed, will be at a depth of 150 feet. The company are determined to develop this mine in good shape.

Flume Fell Down.—The flume of the Shaw's Flat ditch crossing Wood's creek below Saw Mill Flat, fell the early part of the week during the storm. There is a talk, it will be replaced by an iron pipe.

Nevada.

WASHOE DISTRICT.

Consolidated Virginia.—Gold Hill *News*, Oct. 29: The face of the north drifts in advance of the ore breasts on both the 1,300 and 1,400-ft. levels are still in rich ore. The ore breasts and stopes on the 1,300 and 1,400-ft. levels are yielding the usual amount of rich ore. The south cross-cut on the 1,500-ft. level has penetrated the ore vein a distance of 90 ft. without reaching the east wall, the face still being in rich ore. The middle cross-cut on this level is in 87 feet, the face in rich ore. The north cross-cut on the California line is still pushed vigorously ahead, but has not yet reached the ore vein. The north drift on the 1,500-ft. level of the Gould & Curry is still steadily advancing through the same rich body of sulphuret and chloride ores, the assay of car samples of which averages over $600 per ton.

Ophir.—The ore breasts and stopes in all the ore bodies on the 1,300 ft. level are yielding the usual amount of rich ore. The ore body in the south winze between the 1,300 and 1,465-ft. levels is opening out finely. On the 1,465-ft. level the ore stopes in the west cross-cut on the north ore body are showing better as the opening advances.

Crown Point.—The ore breasts on the 1,400-ft. level are opening out splendidly and promise a goodly yield of rich ore. The ore breasts on the 1,500-ft. level are also opening out fully as well as those of the 1,400. The south drift on the 1,500-ft. level has reached to within about 40 ft. of the Belcher line, the face still in rich ore.

Sierra Nevada.—The drift in the ore body recently opened in the old Sierra Nevada tunnel is being enlarged, and cross-cuts are being made in the ore body which show it to be of greater width and extent than was at first expected. Daily yield, 65 tons of ore.

Julia.—The water has been drained sufficiently to admit of the resumption of work in the drifts on the 1,000-ft. level.

Imperial-Empire.—The bottom of the south winze on the 1,850-ft. level is still in rich ore, as is also that of the north winze on the same level.

Mint.—During the past week a fine body of quartz was encountered while sinking the shaft. This quartz vein was struck at a depth of 372 ft., and is of a very promising character. Assays from the bottom ran as high as $17 per ton, mostly silver.

Rock Island.—The flow of water has been reduced sufficiently to resume work in the face of the main west drift.

Leo.—The work of raising the main shaft is progressing well. North drift still in very favorable material.

Phil. Sheridan.—New shaft 150 ft. deep. The ore bodies of the Sierra Nevada mine, adjoining it on the south, doubtless run into the Phil. Sheridan. New hoisting works are soon to be erected over the shaft.

Yellow Jacket.—Sinking an incline below the 1,740-ft. level has been commenced. The sinking of the north winze is being continued.

Dayton.—The south drift at the third station level is running through fine ore, following the red ledge toward the Kossuth line. The ore breasts on both levels are looking and yielding finely.

Woodville.—The ore breasts on the 200 and 300-ft. levels are all looking well and yielding splendidly. The ore vein in the winze below the 300-ft. level shows considerable improvement during the week. The mill is kept steadily running.

Nevada.—The ore dumps are completed, and the extraction of ore from the breasts on the level of the old upper tunnel has been commenced.

Hale & Norcross.—Sinking the main incline below the 2,100-ft. station is being pushed ahead.

New York.—The ore vein in the north and south drifts from the main drift on the 260-ft. level, is looking very promising and some of the assays of the ore run very high, in both gold and silver.

Savage.—Sinking the main incline below the 2,100-ft. level is being pushed with all the vigor possible.

Overman. — The prospects are still very encouraging for the development of a paying mine. Sinking the main shaft is making good progress.

Utah.—The prospecting drifts both north and south on the 400-ft. level are still in quartz of a fine character.

Belcher.—The ore breasts on all the different levels are yielding splendidly. Daily yield, 550 tons of ore. The mills are all running up to their full working capacity, and the mine promises a rich return for many months yet to come.

Lady Bryan.—The west cross-cut at the 250-ft. station is in 32 ft., the face in fair working ground.

Sutro Tunnel.—Work going ahead as usual in the main header, 80 ft. being added to its length since last report. Total length of main tunnel, 7,600 ft. Rock in face of header hard, but blasts well.

Bullion.—The north drift from the 1,700-ft. station of the Imperial shaft is still pushed vigorously ahead, following the west wall of the ledge, with steadily increasing prospects of ore developments.

Globe Consolidated.—The ore body in the north cross cut, from the main west drift, on the 400-ft. level, is still showing finely.

Justice.—Work has been resumed on the Waller Defeat shaft, with increasing ore prospects on the lower levels.

California. — The north drift from the Ophir, on the 1,500-ft. level, has encountered some fine looking quartz, which gives low assays, but is supposed to be a spur from the main ledge. The entire face of the north drift, from the Virginia Consolidated shaft, on the 1,500-ft. level, is in fine ore.

Caledonia. — Sinking the shaft below the 1,076-ft. level for a camp, is making good progress, notwithstanding the extreme hardness of the rock.

Chollar-Potosi. — Daily yield, 75 tons of ore, the assay value of which is $29 per ton.

Kossuth.—The ore vein in the south drift, on the east side of the ledge, from the west cross-cut, is looking finely and promises a fine development.

Silver Hill.—Everything in and about the mine is working finely and the prospects of yet striking bodies of paying ore on the lower levels are growing more favorable.

Original Gold Hill.—Some water and fine ore indications encountered at the 340-ft. level.

Senator.—The ore streak found in the west drift at the 400-ft. level, is showing a steady improvement in both looks and quality.

Occidental.—The up-raise from the lower tunnel level is up 94 ft., the face in fine ore.

Arizona.

Cave Creek District.—Cor. Arizona *Miner*, Oct. 23: In making up your mining news, you could very properly speak of some leads located and now being worked by Mr. Rowe and others. The Cave creek district, in which they are situate, is about twenty-five miles northwest of here. They have a number of leads located, some in which silver predominates, although there are several others very rich in gold, with a sprinkling of baser ores.

Mr. Rowe and two other men are engaged at present arrastraing from a spur of the principal lead in the hill—the Lion, and are well recompensed for their work, although their mode is the most primitive, and they labor under many disadvantages. Three miles east of their mine is an excellent, living stream, named Camp creek, capable of turning a water-wheel. They project building a trail to it shortly, and doing work on a larger scale.

Colorado.

White Cloud.—Colorado *Register*, Oct. 28: B. P. Haman and Joe Walker commenced work to-day on the White Cloud lode, near the head of Russell gulch. They have leased the property for a year, and propose sinking the 60-ft. shaft to a depth of 100 ft., before running levels. The surface quartz from this lode gave exceeding rich returns in 1863-'64, on the strength of which the property was then sold to a New York capitalist for $36,000.

Moses Hall and Henry C. Merrill are working one of the 100-ft. levels of the old Alps lode, in Leavenworth gulch. Their last run of ore yielded $60 per cord, returning them about $12 per cord, net.

The lessees on the Clifton silver mine, Willie gulch, have been notified to suspend work under their lease, in view of the anticipated immediate arrival of the English owners of the property. This, we understand, points to a prospective resumption, at an early day, of extensive operations in this valuable mine by the Clifton company.

Wm. Lyon, L. P. Miller and E. A. Lynn, are still working the Buckley lode, a discovery made by them in August last, on the Prosser slope of Gunnell hill. They employ no additional hands, but themselves break and hoist five cords, or about 40 tons of ore and quartz per week, all of which is sent to the stamp-mill. The ore yields an average of three and one-half ounces of gold per cord, which sells at the banks at $17 in currency per ounce. Messrs. Lyon, Miller & Lynn, estimate the total cost of breaking and raising the ore, including their own labor, at $11 per cord, hauling and milling at $30 per cord, leaving them a net return of $18.50 per cord, or (at five cords per week) $92.50 net yield per week, or a clear profit of $30.83½ per week to the man.

Utah.

Little Cottonwood.—Cor. Salt Lake *Tribune*, Oct. 30: Since yesterday noon the snow has fallen to a depth of two feet, and still it is snowing and blowing, as it only can do in Alta.

Business has been quite lively for some time, as the miners have been busy laying in and getting up to the mines their winter supply of provisions, powder, steel, whisky, etc. Every team and pack animal in the canon has been pressed into service, and kept moving early and late.

The mines are pushing things lively, and making preparations for a winter's siege. They are generally looking well,—in fact, much more encouraging than at this time last season, and are sending down plenty of the precious metal, and larger amounts will be brought to light before spring.

The Emma has again started up, and has a force of men employed concentrating the dump, hauling wood and doing other necessary outside work; but as yet nothing has been done in the mine. Rumor says it will be running in a few days.

The Flagstaff still keeps up its reputation as the leading mine in camp. It employs about 80 men, and ships from 50 to 60 tons daily, and has enough in sight in the mine to run it one year at least.

The Sweepstake Plow Company's Works.

In visiting the beautiful little town of San Leandro, the most prominent object met with is the manufacturing establishment of the Sweepstake Plow Co. The works occupy two large buildings, and these are found very inadequate to the demand for room. This is the principal establishment of the coast devoted to the manufacture of agricultural implements, and the business has rapidly grown into one of the most important industries on the coast. The question is fast being demonstrated that it is better to manufacture than to import. This company employs about ninety men, and find the demand for their wares, sold through the well known firm of Baker & Hamilton, constantly increasing. The main room of the largest building contains the machinery upon which the woodwork of the implements is prepared. All this machinery is of the latest and best, and everything possible is done by steam power—boring, mortising, sawing, planing, drilling, punching, polishing, etc. In a side-room, running the whole length of the main room, are the blacksmith's forges, eight in number. The shop is supplied with two steam power hammers, and inventive genius is displayed everywhere. In the rear of the main building is the foundry, where all the castings used in the machinery are moulded. The filling of the moulds at night with the melted metal from the furnace is a sight worth see. The glowing, red, molten stream as it is poured from the iron kettles into the moulds lights up the whole room with a beautiful yellow light. Myriads of beautiful sparks go dancing and crackling in all directions. This is the poetry of blasting; the prose is the lifting, carrying and emptying of these heavy buckets, the heat from which is very intense. It requires powerful men to handle these kettles. The work turned out is of first quality. The grinding and polishing of the mould boards, which is done by machinery, is very interesting. The grinding is done upon a very large stone, with a very rounding surface. The plows are placed on a machine something like a long wheelbarrow, a man taking hold of the handles and holding the plows against the stone, moving them constantly backward and sideways. They are then placed upon another wheelbarrow and brought in contact with a wheel revolving with great velocity, the surface of the wheel being prepared emery. This is done dry of course, and the contact of the steel with the rapidly revolving wheel produces a magnificent shower of glowing sparks, the metal becoming very hot by the friction. A very fine polish is put upon the plows. Perhaps no other plow, save the Garden City Clipper, receives so fine a finish as the Sweepstake plow, manufactured by this company.

After the implements are finished they are removed to another large building where they are painted and varnished. All the work is done in the most thorough and substantial manner, and the material used is of the best quality. The company are too proud of their reputation to allow any but first-class work to leave the factory. The principal implements made at these works are the Sweepstake and Eureka gang plows, an illustration of the latter being given in this issue. These plows have earned for themselves an enviable reputation, carrying off the first prize at the two last State fairs at Sacramento, and the last fair held at Stockton. At these fairs these plows were put to the severest test in competition with about one dozen others and gave entire satisfaction. The steel gangs with cast steel points have 5-16 inch moulds, extra hardened, warranted to scour in any soil, and are recommended as the best steel gangs in the world. The immense number of these plows which are being manufactured and sold is the best testimonial in their favor. There is but little difference between the Sweepstake and the Eureka—an illustration of one is sufficient for both.

The company are also manufacturing the "Sweepstake" single gear header. They have adopted this header after the most careful investigation and have made several important improvements upon it and believe that the machines they now offer to the public are as near perfection as it is possible to make them. The drive wheels are strengthened and made higher. The draper is extra strong and completely protected from wear by leather belting. The guide wheel and boxes are much improved, making the steering much easier for the driver. They are also making three styles of harrows, the patent flexible, the improved hinge and Sweepstake harrow. The patent flexible is made in four sections and adapts itself to the inequalities of the ground, thoroughly pulverizing the lumps, and leaves it in a smooth and mellow condition. The company believe this to be the best harrow in the State. Another useful agricultural implement made by this firm is the chisel cultivator. It is put together with bolts, in a very substantial manner, and each tooth is intended to stand the entire pull of the team. The firm are also turning out quite a number of very pretty and substantial express wagons, designed for the country. They are made with the Sarven patent wheel and are first-class in every particular. Another article made at these works is the Stockton gang plow. From five to eight plows are put upon a strong beam, this beam forming the hypothenuse of a triangular frame, the whole being carried upon three wheels, one at each angle. The plow is designed for light, sandy soil and will do immense execution. But the implement upon which the company pride themselves particularly, next to the Sweepstake plow, is the Gem seed sower. This sower has been in use on this coast for five years and is constantly growing in favor. It is placed in the hind end of a wagon and geared to the wheel, thus getting rid of the chain and small gears, which have always been a source of annoyance. The grain is thrown out horizontally, in this manner avoiding being carried about by the wind.

One hole can be closed, thus throwing the seed on one side only. Sows evenly, about 60 feet wide, and will sow 90 acres per day. The friction wheel runs the machine at a uniform rate of speed. There is no chain to run off on a hill side or consume power.

The works present an animated scene when in full blast. Their location is in one of the most lovely spots on the globe. Climate delightful, water excellent. The cars of the C.P.R.R., run by the finishing room, and with a new and commodious building the arrangements for manufacturing would certainly be first-class in every particular.

Rights of Locators.

The case of Livingston *et al. vs.* Paxton *et al.*, in which the jury returned a verdict for plaintiffs on Friday, is one of great importance to the original locators of mines in Utah and elsewhere. This was a suit in ejectment, the plaintiffs claiming under their discovery and location of the Southport mine in Rush Valley district, in the year 1864, at which time many soldiers then serving in this territory, and citizens also, made similar locations. On June 11th, 1864, the miners organized the district, established a code of by-laws, and otherwise provided for the government and protection of mining interests there. The case just concluded manifestly turned upon the validity of the district regulations, as appeared from the law presented to the jury in the charge of the court. Chief Justice McKean instructed to this effect: That owners of mines deriving their titles from the operation of the by-laws of districts hold against all except the United States, provided always that these owners had complied with such district by-laws, and this for the reason that Congress, by the act of 1866, made the laws of miners and mining districts virtually legislative enactments. Under these instructions, the jury, after a few moments' deliberation, returned a verdict for the plaintiffs, who were original locators, deriving title to their mine according to the mining laws of Rush Valley district, prior to the act of Congress of 1866. Messrs. Robertson and McBride were counsel for the plaintiffs, and Haydon and Gilchrist for defendants. The case just closed has been before the courts for nearly three years, and now its decision, if final, establishes a principle which gives both justice and right to the pioneers in Utah mining.—*Salt Lake Tribune.*

EUREKA GANG PLOW.

The new Knox & Osborne furnace, at the Ida Clayton mine, on Knight's Valley ranch, is working satisfactorily. It is run by water power; fifteen inches is accessible for the purpose of driving the overshot wheel, which turns the fan creating the draft through the condensers, which are sixteen in number.

There is a firm of brass and copper wire manufacturers in Scotland who have made a penny go further than ever the thriftiest Scotchman could make it, having drawn it out 2,700 feet, or more than a half a mile of wire.

The California Mine.

In five or six days connection will be made between the drift running north from the 1,500-foot level of the Consolidated Virginia and the drift running south from the corresponding level of the Ophir mine. When this connection shall have been completed cross-cutting may be commenced. The drifts, for the sake of stability, are being advanced in west country rock. This rock is very hard, therefore the progress made in it is not rapid, but in the long run it will be much cheaper than if driven through softer material. Drifts and shafts which require frequent repairs eat up a great deal of money. The connection completed, there will be a circulation of air between the Consolidated Virginia and the Ophir through the California ground. Cross-cuts may then be driven east into the vein, and there can be no doubt that rich deposits will be found, as the claim is sandwiched between two large and rich bodies of ore. The opening of the California mine will give employment to a great number of miners; eventually, in all probability, as many as any claim on the Comstock. They may begin hoisting ore at any time by bringing it out through the Consolidated Virginia shaft. The shaft contains four compartments, and all of these may be used for hoisting purposes, as they have not yet found it necessary to place their pump in the compartment intended for its reception. About the time they reach ore in the California, the big mill of the Consolidated Virginia company will be started up, and there will probably be a portion of its stamps that can be procured for the reduction of California ore. Eventually, however, the California company will doubtless build a mill of their own in the neighborhood of the Consolidated mill. The opening up of the California mine will add greatly to the value of property in the northern part of the city. The many men who will be employed in the mine, and eventually in the mill, will look for homes in the neighborhood. The married men will want houses for themselves and families, and the single men will be the paying patrons of not a few boarding and lodging houses yet to be built. Should good bodies of paying ore be found in the Union Consolidated—and the prospects are now very flattering—the north end of the town would soon be packed with buildings—not only dwelling houses, but also stores and shops of all kinds. This, followed by a strike in the Sierra Nevada, would cause half the people in the north end of town to stand on their heads. Well, all this may yet be seen!—*Enterprise.*

Microscope.—According to Prof. Abbe, of Jena, the limit of capability of a microscope in showing the structure of tissues and the character of minute objects has nearly, if not entirely, been reached, higher power than those now in use giving rise to optical phenomena which are likely to completely mask the structure and character of the object under examination. Thus it may happen that while different structures give the same microscopical image, like structures will give different images; and while systems of the fine lines and the like may appear ever so distinct and well marked in the microscope, we are not entitled to regard such appearances as of morphological significance, but merely as physical phenomena from which nothing can be inferred except the presence of such structural conditions as are incapable of producing the diffraction effects obtained. These observations apply more especially to the marking of certain diatoms and striated muscular fiber. According to Prof. Abbe, by no microscope can parts be distinguished if they are so near to each other that if the first bundle of light rays produced by diffraction can no longer enter the object simultaneously with the undiffracted cone of light.

The "Otter" brought down the largest piece of gold which has been found in British Columbia; it weighs very nearly sixteen ounces, and was taken out of the Lyons & Co.'s claim on Dease creek.

Metal Manufactures of the Japanese.

The Japanese are a very industrious and ingenious people, and while in many respects they resemble the Chinese, there are marked points of difference in the habits and manners of the two nations. There is a stamp of originality in the productions of the former as distinctive and peculiar to them, as can be seen in the two peoples of the Anglo-Saxon race, designated as English and American. The Japanese mechanic is generally well-skilled in his employment, and his work is characterized by that nice perception of style and finish which indicates the true artist. It is pains-taking work, but it is performed with all the enthusiasm and devotion so noticeable in the inhabitants of the Orient. Whole families work together at the same trade in the domestic quiet of their own homes, and in this way they transmit a kind of inherited skill to their children, which is observly displayed by even the youngest members of the household who are large enough to be acquainted with the use of tools.

Factory life is almost unknown in Japan, and there are few large establishments of this description, the exceptions being witnessed in a number of important silk factories, porcelain works and cabinet workshops. There are potteries, tile-yards, dye-houses, paper mills, private looms, forges and iron works; but these are mostly domestic pursuits carried on by families, and free from outside assistance. They have few labor-saving appliances worthy of the name, and, with the single exception of the bellows in some of the forges, which are controlled by the action of a water-wheel, there is no evidence that useful inventions are known or have ever been used.

In the fabrication of metals they display rare ability. Bronze articles of exceeding beauty are sold surprisingly cheap. They make ordinary utensils and table appliances of iron, copper and bronze; tall candelabra of many queer and curious shapes; altar vases representing sheaves and wreaths of loaus leaves; ornaments studded with small bells; incense boxes, and beautiful bronze vases. The latter are especially deserving of notice, some of them being of most exquisite model and decoration. Flowers of delicate design are traced on the smooth black surface by hammering fine silver wire into the bronzes, a piece of work never performed except in the East, and considered when properly executed, as displaying most wonderful skill. Their candlesticks are also very graceful and elegant in design, representing birds or plants, flowers, and even children, with a fidelity to to life truly wonderful. At various distances are sharp points on which are stuck large candles made of vegetable wax. In hardware the people transact an extensive internal and export trade, which is very profitable.

In the manufacture of lacquer ware they also excel, and varnishing or japanning has arrived at such a degree of perfection that when it is applied to the most common woods they become as elegant and attractive as polished metals. A vast number and variety of articles are made of lacquer, such as toilet stands, traveling cases, looking-glass frames, etageres, altar-pieces, cases, shelves, and other household articles; beside all the tables, incense stands, tripods and fixtures required in the temples of the idols. The drinking cups of the Japanese are made of red lacquered ware, ornamented with gilt tracery and arabesques, or gorgeous paintings of scenery and landscapes illustrating charming locations throughout the empire. Some of these utensils are still more costly works of art, fashioned from the shells of the nautilus and heliotis, very richly carved, and mounted on silver filigree.—*Iron.*

Technical Schools.—Where our future skilled workmen are to come from is a question which is crowding for solution. The decline, or rather the total abrogation, of the apprentice system has deprived the youth of the opportunity of learning trades. The result is that there are few who are learning, so that skilled labor is getting scarcer in every department of industry. It is therefore a matter of urgent importance that some method should be devised to remedy this difficulty. Of all the plans discussed there seems to be but one which promises success; that is, the establishment of technical schools. The large degree of success which has followed the introduction of these schools in some departments of our activities is strong proof of their utility in all branches. We might refer to our various schools of design and art, to our medical schools, and schools of mining and engineering.

A French journal connected with the metal trade gives the following curious estimate of the value of a piece of iron costing in its rough state 1f., after being employed for different manufactures. Made into horse-shoes it is worth 3f.; into agricultural implements, 4f.; forged into ornaments, 45f., converted into needles, 75f.; into steel buttons, 900f.; employed as polished steel for decorative purposes, 2,000f.; and made into shirt studs, 6,000f.

Good Health.

Good Food and Good Health.

Upon this topio Prof. Blot expresses himself as followa: "The man who does not nee his brain to select and prepare his food is not above the brutes that take it in the same state. It is to the physique what education is to the mind—oourse or refined. Good and well-prepared food beautifiee tbe physique tho same as a well-dirscted education beantifies the miud. People's taste is in food as in drees, differing not nnly in colors but also in shape; therefore, hy nnr variety of dishes and nur different styles of dressing them, by the ease with which they can be prepared, in the cheapest as in the most costly way, we think we moet all wants aad tastes. Iu fact, to make a very little romark, yon cannot make a gentleman hy feeding him nn codfi-h."

There is no conntry where there is so much dyspepsia as in America, because our people pay bnt little attention to food, aad eat too mnch meat for tbe exeroiee they take. If oae has mental labur fish evory secoad day at least is a requisite. Sonp sots all the glands at work, and prepares the stomach for the most important functions of digestion; and therefore should be takeu at dinner every day. Beef broth is to nld age what milk is to the yonng. Cookery, properly attended to, keeps man in health. If tbe stomach is ont of order the brain ie affected.

We have the hard and soft parts in our anatnmy, nnd the bile, and therefore it is requisite to vary onr food. We sbonld eat more fruits, vegetables, soups and fish. Fish and cheese are the best articles of diet to give to children. The United States has the most money of any people, and tbe greateet abundance of the rnw material; yet they live more poorly, in comparison, than any civilized nation. For instance there ie a millionaire in Brooklyn, who has pork and beans every second day for dinner. Wrinkles are produced by a want of variety in food.—*Ex.*

What Girls Should Drink. — Dr. Dio Lewis, in his book, "Our Girls," says: I am astonished that a young woman who is ambitions of a clear, fine skiu, ehould drink tea. It is a great enemy to fair complexions. Wine, coffee and cocoa may be used without tiuging the skin, bnt as soon as tea drinking becomes a regular habit, the eye of the discriminating observer detects it in the skin. Tea compromisee the complexion, probably, by deranging the liver. Weak tea or coffee may be ueed occasionally, in moderate quantities, without noticeable harm; bnt I advise all young women who would preserve a soft, clear skin, and quiet nerves, to avoid all drinks hnt cold water. It is an excellent plan to drink one or two glasses of cold water on lying down at night and on rieing in the morning. If you have good teeth, nnd can help the food into yonr stomach witbont nsing any finid, excent the saliva, it will, in the long rnn, contribute much to your health.

Red and White Muscles. — M. Rinvier points out that the red and white muscles of a body—very clearly seen by removing the skin nf a rabbit—which exist mingled in the same region, are different both in structure and properties. On applying the electric current, the white portions contract almost instantly, and reepond even to rapid and continuous shocks. The red portions, on the contrary, are mnch more sluggish; it requires a certain time for them, apparently, to feel the excitement, while, on quick interrnpted discharges of electricity beiag administered, they eimply assnme permanent contraction. It is believed by the author that the latter are involuntary and of the nature of the mnscles of the heart or other portiona relating to the animal existence; the former, however, he thinks, are controlled hy the will.

Bathing in Cold Water.—Nothing is more common tban a custom of many persons to have a cold water bath immediately on leaving their beds as a daily habit. Delicately organized ladies not nnfrequently have established the eame course, considering it conducive to the health. There is an impreesion that it invigorates the individual, hardens the muecles and etrengthens the constitntion. The snddeu abstraction nf caloric or vital warmth in that way has not only injured bnt deetroyed more than ever were benefited thereby. A reaction, as it is called, a glow of warmtb that subsequently follows, a direct draft npon the system to meet a snddeu loes of vitality, ie by no means ae beneficial as theoretically imagined. .A tepid bath makes no auch injnrious demands, and therefore is not injurions to those of a frail structure.

Increase of Short-Sightedness.—There is nn doubt that the largely increasing number of short-sighted persons resnlte from the imperfect mode of teaching and learning. It is, in a large measure due to the unnatural positions children are compelled to assume by reason of the conatruction of the deska and aeate, and to the imperfect lighting of the school buildinga. It is high time tbat ateps be taken to remedy this increaaing evil, by not allowing children to keep their booka closer to their eyea than is neceasary for correct vision, and to give them a chance to exercise their eyes periodically and often at distant objects.

Bone Felon.—Of all painful things can there be anything so exernciatingly painful as a bone felon? We know of noae that flesh ie heir to. As this malady is quite frequeut, and the subject of much earuest consideration, we give the last recipe for its cure, which is given by that high authority, the London *Lancet:* As soon as the disease is felt put directly over the spnt a fly blister, aboat the size of your thumb nail and let it romain for six hours, at tho expiration of which time, directly under the surface of the blister, may be seen the felon, which can instnatly be tnken ont with the point of a needle or a lancet.

Hash and Health.—At last science grapples with this mysterious compound. The attention of tho averege New York boarding honee keeper is directed to the words of Prof. Redfern, who condemns tho process of cutting up meat into small blocks, and then stewing it, the effect of which is that the albumen in the outer surface of each block becomes firmly set, and the whole affords about as indigestible a mass as can well be imagined.

Useful Information.

Strength of Various Kinds of Glass.

Acqnaintance with the strength of glass, in the various forms in which it is employed in art and industry, has generally been quite limited, and the result of recent experiments shows some interesting facts, not commonly nnderstood, as to the tenacity, the resistance to compression, and to barstiag and collapse, characterizing this widely used material.

The experiments relating to the tenacity of glass, made by tearing specimens asnnder, showed the tenacity per square inch, of fiiut glass, to be 2,413 pounds; of green glass, 2,896; of common glass, 2,146; these, of course, being the mean results.

To test the resistance of the material to crushing, small cylinders and cnbes of glass were crashed between parallel steel surfaces by means of a lever. The cylinders were cut of the reqnired length, from rods drawn to the desired diameter, when molten, and then annealed—in this way retaining the exterior and first cooled skin of glass. The cnbes, however, being cnt from much larger portions, were consequently in a less perfect condition as regards annealiag. Without attempting to present the details involved in this part of the investigntion, snffice it to say, that the specimens were crushed almost to powder by the violence of the concnesion—bnt it appeared that the fracture occurred in vertical planes, splittiag np the specimens in all directions. Cracks were noticed to form some time before the specimen finally gave way; then these rapidly increased in number, splitting the glass into innumerable prisms, which fiually bent or broke, and the specimen was destroyed. The mean resistance to crnshing was, in the case of flint glass, 13,130 pounds; green glass, 20,206; crown glass, 21,867.

Mine of Liquid Sulphur.—It is reported that a few miles from San Martino, near Palermo, a mine of liquid sulphur is being worked. That is to say, the sulphur is being removed as it runs from the fissures in the rock, at the rate of 400 to 500 quintals (abont 40 or 50 tons) a day. The sulphur proceeds from a mine in the interior of the mountain which is in a molten state. The men are often obliged to stop np the fissures from which the molten sulphur ruas so as to give it time to cool sufficiently to be removed, after which the fissures are again unstopped. It happened at the end of July, on unstopping one of these fissnres, that no sulphur was found, nnd the idea entered the heads of the workmen to reopen the hole by blasting. They succeeded in re-establishing a communication with the interior, but the pressure had become so strong during the obstruction, that the expansion of the gas produced a terrible explosion, which blew the workmen ont of the mine and even sent them flying 50 meters (nearly 55 yards) into the air. Five were killed on the spot, four were seriously injured, and two had to be left in the mine, whence it was impossible to remove them, owing to the snffocating smoke which was evolved. Not one of those eleven workmen came out safe and sound.

To Make Good Dutch Cheese.—Set the sour milk on a warm stove until the whey separates from the curd; then put it into a large, coarse towel or thin cloth, and tie it np. Lay it in a pan and let it lie. Occasionally turn off the whey until no more whey runs out. Then put it in a dish, and with the hands work in it salt to taste, and a piece of butter and cream to make it adhere sufficiently to make into balls. Some persons like to eat it with sweetened cream.

Wind Power.—There are said to be upwards of a hnndred private mansions near New York city which employ windmill power for pumping water, sawing wood, grinding, threshing grain, etc. The *American Manufacturer* states that in many instances they are superseding steam engines, water wheels, hydranlic rams, horse power and caloric engines, being run without cost, exeept for lnbricating oil. These mills are not only noiseless, as now constructed, but they are also self-regulating.

How Eggs are Hatched.

People have an idea that the hen sits on the eggs for a time, and when the time comes for hatching the chick bursts forth. There never was a greater mistake. The chick, until liberated from the shell by ontside aid, is as incapable of motion as if it formed a solid egg, which it nearly does. You might as well inclose a man in an iron boiler, and tell him to get out of the shell without help. The chick grows on the insido of the shell, until at last the excrescence on the point of the beak of the bird prosses against the inside of the shell, and bursts up a very small scale. Of course when it does this, it at the same time "breaks in that spot" the inside of the egg. This admits the air; in a short time it breathes and gets strength to cry loudly. The hen then sets to work to liberate it; she brings it forward under the feathers of the crop, and supporting it between the breast-bone and the nest begins the work of setting it free. She hitches the point of her beak into the hole formed by the raising of the scale by the chick's beak, and breaks away the egg-skin or shell all around the greatest diameter of the egg. The joint efforts of the hen without and the chick within then liberate the prisoner, and he struggles into existence, and gets dry under the feathers and natural heat of the hen. All female birds which sit on their eggs to hatch them have the hook in the beak strongly developed. Even the broad-billed duck and goose have those hooks specially developed, and with them they liberate their young. In Australia, where everying seems to be by contraries, it is the cock of the bush turkey that hatches the eggs, and not the hen. It would be interesting whether the hook of the beak is better adapted for this service in the male bird than in the female. The hook of the beak of the ordinary cock of the common fowl is quite different from that of the hen—it is adapted for wounding in fighting, but not for hatching of eggs.

Cause of the Rusting of Iron.—It has nenally been snpposed that the rnsting of iron depends principally npon moistnre and oxygen. It would appear, however, from Dr. Calvert's experiments, that carbonic acid is the principal agent, and without this the other agencies have very little effect. Iron does not rust at all in dry oxygen, and bnt little in moist oxygen; while it rusts very rapidly in a mixture of molst carbonic acid and oxygen. If a piece of bright iron be placed in water saturated with oxygen, it rnsts very little, but if carbonic acid be present, oxidation goes on so fast that a dark precipitate is produced in a very short time. It is said that bright iron placed in a solntion of caustic alkali does not rust at all. The inference to be derived is that by the exclusion of moist carbonic acid from contact with iron rust can he very readily prevented.

To Extinguish Kerosene Flames.—The alarming frequency of accidents from kerosene flames, coupled with the great difficulty encountered in subduing them, renders the acquisition of any ready and convenient means of extinguishing them a matter of much importance to every household. Perhaps one of the most ready means is to throw a cloth of some kind over the flame, and thus stifle it; bnt as the cloth is not always convenient to the kitchen, where such accidents most frequently occnr, some one recommends *flour* as a substitute, which is always at hand in the kitchen, and which it is said promptly extinguishes the flames. It rapidly absorbs the fluid, deadens the flame, and can he readily gathered up and thrown out of doors when the fire is out.

Explosive Paper.—Make a mixtnre of saltpeter, 8 parts; chlorate of potash, 5 parts; charcoal powder or pulverized coal, 1 part; fine saw-dust of hard wood, 1 part; and a little mucilage, gum or other binding material; put water enough on it to change it into a paety mass, work it well through, and soak strips of heavy blotting-paper or its equivalent in it. If you dry these strips, you obtain explosive paper; if you roll them up tightly when wet and let them then dry, you obtain little blocks which, when confined and fired, will explode with great violence, but will not easily go off by percuesion or friction alone.

A Cure For Corns.—A French medical jonrnal reports the cure of the most refractory corns by the morning and evening application with a brush, of a drop of a solution of the perchloride of iron. It states that after a fortnight's continued application, without pain, a patient who had suffered forty years from a most painful corn on the inner side of each little toe, was entirely relieved; presenre was no longer painful, and the cure seemed to be radical. Other and similar cases are reported as equally successful nnder the treatment.

To Remove Perspiration from Kid Gloves.—Where the coloring matter of dyed gloves has been affected, we know of no method of renewal except re-dyeing. Where benzine fails to remove the dirt, you can try the following French invention: Curd soap (in small shavinga) 1 part, water 3 parts; mix with heat and stir in eaaence of citron 1 part. The glove is stretched on a wooden hand of appropriate size and the componnd rubbed over the glove (with a piece of flannel, alwaya in one direction) nntil it is sufficiently olean.

Domestic Economy.

Economise Your Strength.

Honsehold details are so numerous and complicated that the mother of a family is often obliged to attend to many of them at once, and she ought to learn to mingle the lesser taske with the greater, so that one sot of muecles is resting while another is called into action. In this way some intervals of comparative rest can be secnred, and the work move along more to the purpose than if there were no partial breaks in the endless chain from morning till night. For instance, if pies or apple sauce are to be made, when the breakfast dishes are washed, sit down to prepare the apples and it will not infringe our code of domestic by-laws if yon shonld happen to mix the pie-crnst also while sitting, for rolling it out and finishing the pies will be more easily done after this brief rest. When the coffee is to be browned, it is well to give that process close attention, though sometimes mending stockings or reading will not interfere very much with the roasting, if one eye is kept on the oven.

In many houses the washing machine has shorn Monday morning of half of its discomforts, but genius has not rescued us from the thralldom of ironing day; so here necessity becomes the "mother of invention." We find a board like those used for ironing dresses and skirts furnished with four legs just long enough to come over the lap is very convenient. On this one can iron all small articles, and, if necessary, even shirts and large garments, though not quite so rapidly as at the table, and the change of posture, for a short time, is a relief when there is a large ironing to do.

Cutting garments on a table is tiresome work, and the ironing bench can be used for this purpose, but a lapboard is better. It should be about three feet in length by two feet in width, with a half circle cut ont on one side to fit the form. After a few hours of hard work in the kitchen, the weary housewife will appreciate the advantage of being able to prepare garments for the sewing machine without extra exertion.

Perhaps a healthy, energetic woman might deepise these simple expedients for lifting heavy burdens; but in time even she may have ample need for some strength held in reserve; while there are thousands of feeble women who gratefully accept any suggestions that will, in the least, lessen their labors. If they do the best they can, there will be many wide gaps in the course of the year which they can not fill; and without wishing to be misunderstood, or to appear as an advocate for sloth and "inglorious ease," I believe that the ambitious wife and mother who does the most of her own work is more apt to do too much than too little. She can well afford to economize strength and preserve health, thereby securing more time for her own mental culture and retaining the ability to wisely superintend the moral and physical education of her children. —*Ruth Lee in Moore's Rural.*

Here is a recipe for making Graham biscuit without yeast, soda or cream tartar. Take cold water—say one pint or qnart, according to the quantity one desires to make, or the size of the family demands—and with one hand sift in the Graham flour through the fingers, stirring with the other till you have rather soft dough; then knead it for about five minutes; roll to about three-fourths of an inch thick; cut ont with a common biscuit cutter and prick with a fork (this is done to prevent blistering over top) and place in a very hot oven to bake 30 to 45 minutes, according to the heat of your stove. Care should be taken not to burn the biscuit. This plan will make very light and sweet Graham biscuit.

Spiced Tomatoes.—To four pounds of large red tomatoes take two pounds of gold brown sugar, a pint of cider vinegar, half an ounce of cloves, and half an ounce of stick cinnamon. Stew altogether, in a preserving kettle, over a slow fire, until the tomatoes are nearly cooked. Take them out and put them on dishes to cool, letting the syrup go on simmering slowly. When the tomatoes are cold return them to the syrup and finish cooking. Let them become cold before putting them into jars. The syrup must be boiled down until as thick as molasses, and poured cold over the tomatoes. Tie them down with bladder or waxed paper.

Lemon Tartlets.—Rub a teacupful of sugar in lumps over the rind of a fresh lemon so as to absorb all the essential oil; squeeze the juice of the lemon over the sugar; crush it fine with a sponge; add to it two eggs well beaten and two tablespoonfuls of sweet butter; heat all together and bake in little patty-pans, lined with puff paste.

Sugar Snaps.—One cup of butter, two cups of sugar, four cups of flour, one egg; stir sugar and butter to a cream; add the egg well beaten, and a small teacupful of water with a quarter of a teacupful of soda dissolved in it; stir half a spoonful of cream tartar into the flour; roll out very thin, and bake in a moderate oven.

Flannel Rolls.—One cup of sweet milk, whites of two eggs, two-thirds of a cup of butter, flour to make a thick batter, one-half of a cup of yeast, two tablespoonfuls of sugar. Raise over night; add the butter and eggs in the morning; work in some flour, making a limber dough; form into rolls, and after the second rising bake.

MINING AND SCIENTIFIC PRESS.

W. B. EWER.....SENIOR EDITOR.

DEWEY & CO., Publishers.

SUBSCRIPTION AND ADVERTISING RATES.

SUBSCRIPTIONS payable in advance—For one year $4; six months, $2.25; three months, $1.25. Clubs of ten names or more $3 each per annum. $5, in advance, will pay for one and one-third year. Remittances by registered letters or P. O. orders at our risk

ADVERTISING RATES.—1 week.	1 month.	3 months.	1 year.
Per line.....25	.80	$2.00	$5.00
One-half inch.....$1.00	3.00	7.50	24.00
One inch.....2.00	5.00	14.00	40.00

Large advertisements at favorable rates. Special or reading notices, legal advertisements, notices appearing in extraordinary type or in peculiar parts of the paper, inserted at special rates.

We Will Prepay All Postage

On this paper after the 1st of January, 1875, as the law demands. This is equivalent to reducing the subscription price 20 cents per annum. Besides, it will save subscribers the annoyance of paying petty postage bills every quarter.

San Francisco:
Saturday Morning, Nov. 7, 1874

TABLE OF CONTENTS.

EDITORIALS AND GENERAL NEWS.—Purifying Quicksilver; Patent Nonsense; Academy of Sciences, 289. Street Sweepings and Fertilizers; The Belcher Mine Fire; That Tea Set, 296. Grafting the Grape; San Francisco Tanneries; Artificial Wine, 297. The Elections; Epidemic Among the Celestials; Public School Notice; Snow in the East; County Judge; Labor Troubles in England; The Carlist War; Narrow Gauge Locomotive; Case of Cremation; Pacific Coast Appropriations; Murdered his Brother's Wife; San Francisco Harbor; Thanksgiving; Troops for the South; An Expensive City; The General Post Office; Patents and Inventions, 300.

ILLUSTRATIONS.—Randol & Wright's Quicksilver Purifying Apparatus, 289. Grafting the Grape, 297.

SCIENTIFIC PROGRESS.—Singular Effect of Great Heat—Fire-proof Construction; Variability of the Sun's Diameter; Triumphs of Science; A New Lamp; Purification of Water by Contact with Iron; Whitworth Steel; The Vibratory Note; A New American Barometer; Putrefaction; Pyrometers, 291.

MECHANICAL PROGRESS.—Greasy Water in Steam Boilers; A 6,000-ton Steamer for the Mississippi; Portable Fire Walls; Simple and Ingenious Device; A New Mechanical Separator; Thin Saws, 291.

MINING STOCK MARKET.—Table of Daily Sales and Prices and Comparative Prices for the Week; Notices of Assessments; Meetings and Dividends; Review of Stock Market for the Week, 292.

MINING SUMMARY from various counties in California, Nevada, Arizona, Colorado and Utah, 292-3.

GOOD HEALTH.—Good Food and Good Health; What Girls Should Drink; Red and White Muscles; Bathing in Cold Water; Increase of Short-Sightedness; Bone Felon; Hash and Health, 295.

USEFUL INFORMATION.—Strength of Various Kinds of Glass; Mine of Liquid Sulphur; To Make Good Dutch Cheese; Wind Power; How Eggs are Hatched; Cause of the Rusting of Iron; To Extinguish Kerosene Flames; Explosive Paper; A Cure for Corns; To Remove Perspiration from Kid Gloves, 295.

DOMESTIC ECONOMY. — Economize Your Strength; Spiced Tomatoes; Lemon Tartlets; Sugar Snaps; Flannel Rolls, 295.

MISCELLANEOUS—Mining in Colorado; Buying the Right of Way; Montana Mining Matters; Mining in Yavapai and Mohave; Salmon Hatching; Steel for Cannon; South Mountain; Quicksilver, 290. The Sweepstake Plow Company's Works; Rights of Locators; The California Mine; Microscope; Metal Manufacturers of the Japanese; Technical Schools, 294. The Fall of the Leaf; Columbia District; Manzanita Mine; Steam Packing; Lida Valley; Oriental Mill, 298

The New Mint.

The new Mint was thrown open to public inspection on Saturday last, and was visited by several thousands of our citizens. It was on Thursday handed over to G. H. La Grange, who has been appointed custodian of the same. The San Francisco Mint building has been erected and furnished apparently without regard to expense, and when fully fitted up will be the most extensive and perfect institution of the kind in the world. We have no knowledge of its cost; but it must be very large. The building is a very imposing and substantial structure, perfectly fire-proof throughout. It is classical in design and ornamented with Doric columns and pilasters.

The building is of two stories with a basement altogether above ground. The boilers and some of the heaviest machinery are in the basement. The engine, which is of elegant and massive construction, is upon the second floor. The Treasury and banking rooms are large and elegant, as are also the officers of the melter and refiner. The offices throughout are large and commodious. The machinery is all substantial and elegantly finished, and every detail of the interior of the building appears to be perfect. The only objectionable feature connected with the structure is the faulty character of the outer portion of the walls, to which fact we have alluded several times during the construction of the building. It will be recollected that Mr. Mullet, the architect, himself has spoken disparagingly of that portion of the work.

We understand that certain portions of machinery in the old Mint will be at once transposed to the new, and that coinage will immediately commence there, and with very little interruption in consequence of the removal. Actual coinage operations will not be suspended for over fifteen days. Bullion deposits will, however, be received within one or two days after the transfer has been commenced, and gold deposits assayed and paid for from the U. S. Bullion Fund. The coinage at the new Mint will be confined for several days to silver.

The Director expresses his determination to so arrange Mint matters on this coast as to insure the coinage of trade dollars in such quantities as will meet the increasing demand for the same.

Street Sweepings and Fertilizers.

In the large centers of population in Europe considerable attention has been paid of late years to the utilization of sewage. In this country few attempts have as yet been made in this direction, though it is probable that before many years it will become a subject of more importance than we consider it at present. In England fertilizing substances of every description are extensively used, and the land is supplied with what it needs in the proper quantities according to the class of crop. Detailed scientific experiments have been made and the results given to the public, and the people have not been slow to adopt the systems and substances that have been proven practically to be successful. The main thing, of course, has been to get a substance which was plentiful, efficient and at the same time cheap.

Near some of the large cities in Europe establishments have been put where night soil is collected, deodorized and prepared for fertilizing purposes. In some of the English towns the "pail" system of removing night soil has been adopted. This system consists in placing an iron pail under the seat of the privy to receive the night soil, and which is removed as frequently as necessary through a small door. The pails are covered with a lid and placed in a wagon specially constructed for the purpose, provided with a roof and doors at the sides for the admission and removal of the pails. An empty pail is substituted for a full one at each collection. This system is in vogue in six or seven of the principal towns in Lancashire, having originated in Rockdale. The company which collects this material have machinery, retorts, etc., for utilizing the sweepings of the streets. The sweepings are exposed to an intense heat in the retorts and are converted into a finely pulverized charcoal. This makes a very efficient charcoal solely from street sweepings, and available for deodorizing purposes, being adapted for use in dry closets, the wards of hospitals, public urinals, months of sewers, and for using with all kinds of offensive material. By its use all decomposing substances are rendered perfectly harmless, so that they may be removed without offence or damage in the daytime instead of at night.

On the arrival at the yards of the wagon with the pails above spoken of, their contents are emptied into a shallow tank formed in the floor of the shed and a few shovelfuls of the charcoal are immediately thrown on the night soil. A reporter of the *Engineer*, who witnessed the operation says the effect is certainly surprising, the offensive odor being immediately removed. The mixture is then well incorporated, placed in sacks and sold for manure at a very reasonable price, which, however, leaves a profit to the company. The street sweepings are also ground and mixed with certain proportions of clay and then charred, in which condition they are used for the filtration of sewage. The manure made by this process is very good, as it is composed entirely of night soil and carbonized street sweepings, which latter contain a large quantity of animal droppings. The works where this business is carried on were erected at Salford to ascertain, experimentally, whether charcoal possessing powerful deodorizing properties could be made from the street sweepings at a cost which would be commercially profitable.

On the 13th ult., the Tacoma saw mill cut 82,159 feet of lumber, an average of 8,000 feet an hour, during the 11¼ hours' working.

The Vallejo barrel factory commenced operations Monday, after a suspension of several months.

Mercuryville is the name of the town just started on the grade between the Missouri mine and Geyser hotel.

The Original Gold Hill mine, on the Comstock, is to have new hoisting works.

The Vallejo foundry has shipped a quicksilver furnace manufactured for a Colusa mine.

The Gold Mountain mining company, San Bernardino county, have 200 men employed.

The mining excitement at Mount St. Helena continues.

The Eastport coal company are now shipping about 2,200 tons per month.

The Belcher Mine Fire.

At about 2 o'clock last Friday afternoon the timbers in the new air shaft in the Belcher mine, on the Comstock, was discovered to be on fire. The fire started on the 800-ft. level, and a few moments afterward a huge volume of smoke poured out of the mouth of the shaft. The alarm was promptly sounded by the various fire bells and hoisting works' whistles throughout the town. The fire department turned out in full force and hurried to the scene of the conflagration, followed by thousands of spectators, including women and children, who were sobbing hysterically, fearing that their husbands and fathers, who were working in the mine, had perished in the flames. The whole energies of the officers and men employed in the mine were devoted to extinguishing the flames. Superintendent Smith and Foreman Donnelly were on the ground personally superintending the work. An immense stream of water was brought to bear on the fire through the hoisting works' hose. Half an hour after the commencement of the fire, the flames, which had hitherto been smouldering, burst out into the air with terrific violence, a distance of several hundred feet, hurling fragments of rock in every direction. At this stage the fire resembled a huge volcano in active operation. The few men who worked in the shaft when the fire broke out had a narrow escape from death. The last one who came up through the shaft had to pass through the flames a portion of the way, and came near being suffocated.

When it was found that the flames could not be extinguished from above, eight men were lowered from the hoisting works to the drift at the 1,000-ft. level to tear out the timbers and the track communicating with the air-shaft, and build a bulkhead to prevent the spread in that direction. The current of air is usually down the air-shaft, but the heat from the flames reversed the process, and the wind sucked down the shaft at the hoisting works. The men were engaged in the work, and succeeded in tearing up the timbers and the track, and partly accomplished their object, when a fearful cave came down the air-shaft, which forced the flames as from the mouth of a huge cannon, full upon them. The result was most fearful. Six of the eight men were severely burned, and the other two more or less injured. The unfortunate men were speedily brought to the surface. They had done sufficient to prevent the flames from reaching the stopes connected with this level, wherein had been the chief danger.. From this time the flames began gradually to subside. The opinion as to the origin of the fire is that it arose from the carelessness of one of the men employed in the 850-ft. level in leaving a burning candle sticking in the timbers. There are about 1,000 men employed in the mine, and although strict injunctions are given to use every precaution with candles, still among so many there are sure to be some of careless habits

The following is a list of those who accompanied A. S. Burt and John Downey, foremen of the mine, in the attempt to erect a bulkhead, and who were more or less injured: William Upham, foreman, somewhat severely burned; it is expected that he will recover in a few days. John Bigge, also an underground foreman, was burned about the arms and chest and face. Patrick Clohesy, foreman, terribly burned about the face and body. William Johns, very seriously burned all over, died this week. Thomas Treglown, not seriously injured. Frank Leclare, a Frenchman, not much burned. Richard Pollard, very seriously injured; burned all over the body, beside which he is suffering from inhalation of impure air; it is hoped he may recover, but the physicians consider this case a bad one. James Thomas, burned, but not dangerously. Charles Sweeney, burned very seriously, his skin being off on nearly the whole of his body. William Thomas, very seriously burned over the body. The men who were injured were all volunteers.

The amount of damage done is estimated at between $20,000 and $30,000. On Saturday morning the workmen found in the mine the dead body of Patrick Kelly, brother of John Kelly, the well-known mining expert. Patrick Kelly was one of those who volunteered to descend into the mine for the purpose of preventing the spreading of the flames, and lost his life in the air shaft, which turned the current of fire down the shaft. He got badly scorched by the sheet of fire which burst in upon him, and in the confusion wandered off in the wrong direction. He fell down a chute a distance of twenty-five feet into an incline and then crept into a small drift, where he was found.

The Crown Point mine is looking well throughout, and promises a rich yield for many months yet to come. Opening out the 1,600-ft. station is making rapid progress; the mills are again running up to their full crushing capacity, and the future prospects of the mine look bright and prosperous.

A turnpike and toll road is soon to be built from Knight's valley to the Great Western quicksilver mine, in Lake county. The right of way is now being secured.

The mines in Winnemucca mountain are now yielding sufficient ore to keep the Humboldt reduction works in constant operation.

That Tea Set.

The editorial columns of the *Scientific American*, our New York contemporary, are generally well and ably edited, and their articles are usually based on sound sense and judgment, but we are compelled to find decided fault with the article in its issue of October 31st, headed "A Panic in the Patent Office." Why the *Scientific American* should demand the discharge of the entire Patent Office force, from the Commissioner down to the petty clerks, simply because the latter contributed towards purchasing the retiring Commissioner a tea set, as a token of their regard for him, we cannot see, unless the proprietors of that paper think to make capital out of a circumstance utterly trivial in itself, but by a legal quibble involving these people in the legal meshes. Had the tea set been purchased by contributions of the office, and presented to General Leggett, when he first entered upon the duties of his office, or during his active management thereof, we would then consider that the law had been violated, and the severe article of the *Scientific American* would not be out of place. But we must be excused for not seeing any wrong in the donation, after Commissioner Leggett had handed in his resignation and his successor had been appointed, but not yet qualified. The extreme bitterness of the article above referred to is evidence that it was either written in a spirit of vindictiveness, because Commissioner Leggett would not allow the proprietors of that paper to manage the Patent Office, or they expected to obtain control of its next officers, who, in case they succeeded in their efforts to have the whole present force expelled, would naturally stand in fear of such a power. One thing is certain, if Mr. Thatcher should succeed General Leggett, as Commissioner of Patents, the *Scientific American* Patent Agency cannot expect any favors from that quarter, other than what the strict letter of the law and justice provide for it. This we look upon as a natural sequence of the article above referred to.

We should look upon the expulsion of the entire Patent Office force as one of the most calamitous occurrences that could befall our country. If there is any one department of our government in which a too frequent rotation in office works evil, that department is the Patent Office. No person, whatever his other qualifications may be, is fitted to be an examiner until he has spent several years inside the walls of the Patent Office. We agree with the *Scientific American* that some—a few—of the examiners, might be removed for incapacity and illiberal views towards inventors with benefit to the country, but to demand the expulsion of the entire force is to demand the total disruption, for a season at least, of our patent affairs. Many of the officers and examiners are worthy and competent, and it would be impossible to fill their places as well as they are now filled. Still the *Scientific American* would make no exceptions. General Leggett has made a good Commissioner; he has instituted many reforms in the office, and his decisions as a rule have been just and equitable. We are only sorry that we did not get a chance to contribute towards that tea set.

The death is announced of Sir John Rennie, the eminent civil engineer, under whose direction some of the most important engineering works of the past half century have been carried out. Sir John was born in 1794, and was the son of the late Mr. John Rennie, who designed New London bridge, and who also designed and executed Southwark and Waterloo bridges. Mr. Rennie educated his son for his own profession, and left to him the task of executing his designs for London bridge. Among his other important works we may mention his completion of the drainage of the Lincolnshire fens, commenced by his father, and the works connected with the harbor of Ramsgate. Sir John was employed by the Earl of Lonsdale in the construction of the new docks at Whitehaven, and through his career he was largely interested in railway operations.

We are informed by a gentleman just in from Bear valley mining district, says the San Bernardino *Argus*, that the Gold Mountain company have 200 men employed at their mine, and that they intend to push things. He says they have one of the biggest mines he ever saw, and he has traveled all over this State and Nevada.

The Consolidated Virginia mine is looking splendidly at all points, and the prospecting being done is proving the greater extent of the ore bodies in almost every direction, and shows the mine to be as yet but scarcely prospected in any direction whatever.

Last week Charles Robinson, an old quartz miner, discovered a ledge below Auburn, so rich that he pounded out about $200 in less than a day in a hand mortar.

Estimates put the yield of the precious metals this year in Utah at $10,000,000. This is against $5,000,000 last year.

Fifteen miles of the Santa Cruz and Watsonville railroad have been graded. Track laying will soon be commenced.

Grafting the Grape.

[Written for the PRESS by Felix Gillet, of Nevada City.]

Of all the modes of grafting the grape known and used in Europe, the one most recommended as never failing and otherwise having certain advantages on all others, is

Grafting by Approach.

This might be done in four different ways. First, if the variety to be grafted is close by the stock upon which grafting will be done, just bend down a sprig of the former to the foot of the stock and set it in a kind of groove made in the body of the stock with a gouge, or better with a gouge-like tool (see fig. 2). This groove must be deep enough to hold the sprig, of which the bark or rather epidermis has to be scraped off, that is the side that goes into the groove. It is then well tied up to the stock; wax or clay might be used, although it is not absolutely necessary.

Fig. 1 shows well the whole operation. This is the second way of grafting by approach. First, rooted cuttings of the varieties to be grafted have to be set in pots sometime before grafting; said pot with vine is then buried in the ground close by the stock and the same operation as the one described for fig. 1 is done in a similar manner, as is represented by fig. 3.

Fig. 1

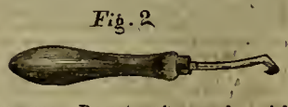

Fig. 2

These two modes of grafting by approach never fail and a great advantage with them is to not endanger in the least the crops of both vines, which are at liberty to grow and bear their usual crop. So if the graft does not take, the stock or rather both vines are all right, which is not the case with cleft grafting. Next year, provided the graft has taken, the stock has to be cut above the graft and the sprig below it.

Some people in California—for we are a fast State—may have objections to this slow, although sure way of grafting by approach, particularly when it has to be done on a large scale. Here, however, are two other and quicker modes of that special way of grafting.

Instead of a rooted vine set in a pot, a common cutting is used, being set on the stock on the same kind of groove and in the same manner as for the preceding grafts. From five to six inches of the cutting must stick in the ground so as to keep the cutting fresh and green. (See fig. 4). Here again, if the operation does not succeed, the stock is all right. The French call this way of grafting, cutting graft.

The fourth method of grafting by approach is somewhat like the one above, with this difference that instead of having the cutting sticking in the ground it is dipping in a bottle filled up with water, which bottle may be partly buried in the ground. The bottle has to be kept full until the graft is well taken. With tall vines, that have to be grafted high, like those running along walls, porches, etc., this mode of grafting is of some advantage, the bottle in this case being tied up higher where it is needed near the graft.

English Graft.

This is the next best method of grafting the grape. As shown by figs. 5 and 7, this graft is done a little above the surface of the ground, with the end of the scion, (fig. 6), sticking a few inches in the ground. Fig. 5 represents the stock ready to get the scion, (fig. 6), and fig. 7 represents the operation completed. The earth has to be drawn around so as to cover the graft, as represented by the dotted line, *d*, in fig. 7.

Cleft Graft.

This graft, the only one spoken of by authors in their works, succeeds well enough when it is done below the surface, or still better as we are going to describe it, the graft in this case not taking root.

The stock in the first place has to be cut off from four to six inches above the surface, (see fig. 8), and the scion set in the same manner as for common apple-grafting; the earth, too, has to be drawn around as represented by the dotted line; this little mound being removed after the operation has succeeded. Instead of splitting the stock in the middle, a hollow cut or groove might be made deep enough to hold in the scion.

Saddle Graft.

This mode of grafting is also used with success. Fig. 9 shows the stock and scion ready to be grafted together, and fig. 10 the grafting done. The dotted line represents the earth drawn around the graft.

With all these grafts, a little wax or clay might be used, though they generally succeed without it. When the scion, as is generally the case, is smaller than the stock, it has then to be set so that its bark will correspond with that of the stock.

Time For Grafting.

The best time for grafting the grape is when the sap is getting ready to go up; when it commences to run; say the latter part of March for the foot-hills, earlier of course for the valleys and southern counties of California. Scions for grafting have to be cut not later than January, and better in the fall, as soon as the vines have shed their leaves; their length being about one foot. They are put up in bunches, the butt end several inches in the ground or sand, and in a sheltered place. I put in my cellar, buried one-third in moist sand, all kinds of cuttings, being the best place to keep them against frost and winds.

For grafting take only that part of the branch nearest to the old wood; the bud, too, should be close enough. In grafting it must be seen that a bud be close to the graft; for not only will it be liable to be broken off, but it is the one that will give the finest shoot.

General Remarks.

When the graft is growing all other shoots around the stock have to be mercilessly nipped off, leaving none but those of the graft. Short stakes might be set at the foot of each grafted stock, so as to tie up the shoots from the graft when they are long enough for that; young shoots, as every one knows, are very easily broken off by the wind. Grapevines having no live bark, the sap goes up indistinctly through the capillary vessels which nature has placed in great number in the wood of that plant; while with trees the sap circulates exclusively between the bark and the wood of the tree. It is therefore immaterial which way the graft is placed in the cleft, whether even with the stock's outside or sideways: in either case it will take.

Do not graft black grapes on white grapes,

Fig. 1

Fig. 2

and vice versa. Do not graft on weak or sickly vines, but, on the contrary, on most healthy and vigorous ones. Common varieties do generally better than fine ones. Do not graft when it is raining or threatens to rain, too much moisture rendering the sap too impetuous, watery and devoid of gluten; if through the summer the graft grows too long, shorten it with the shears or knife.

The Rain.

The rain-fall in this city for the month of October was 2.73 inches, against 0.08 inches

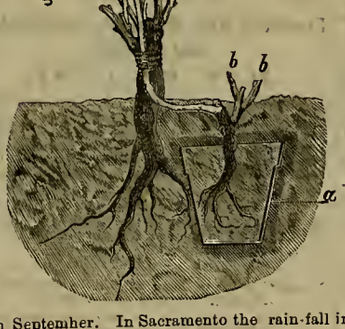

Fig. 3

in September. In Sacramento the rain-fall in October was 2.257 inches, against 0.050 inches in September and 0.310 inches in October, 1873. In looking over the rain tables for the last twenty-five years we learn that there have been but two years in which the rain-fall at Sacramento for October has exceeded two inches. These years were 1858, in which the

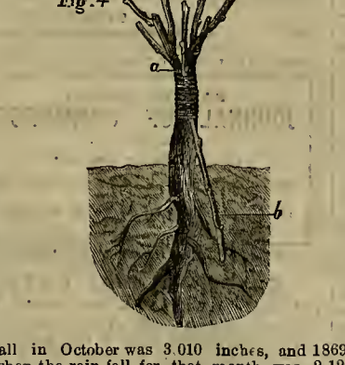

Fig. 4

fall in October was 3.010 inches, and 1869, when the rain-fall for that month was 2.120 inches. We notice, also, that during this same period there have been but two other years in which the rain-fall for October exceeded one inch. In 1849 the rain for October was 1.05 inches, and in 1854, for the same month, was 1.01 inches. In the years 1850, 1852, 1855, 1859, 1866, 1863, 1867 and 1868 there was no rain in October at Sacramento. In October, 1849, in this city in three days 3.14 inches of rain fell, or over an inch a day. In 1861, 1863, and 1870 no rain fell in October in this city. Last October 0.68 inches fell here, against 2.73 inches this year. The rain-fall for October, 1849, was the heaviest we have ever had in that month in San Francisco.

The "weather sharps" of different localities can make their own predictions about the coming winter to suit their own fancies. The farmers will hardly need to be reminded to put in their grain as soon as there is sufficient moisture to start the plow; and they know that the sooner the grain has a good start, when the spring opens, the better it will come to maturity in most localities. Those who have not, as well as those who have, an idea that this will be

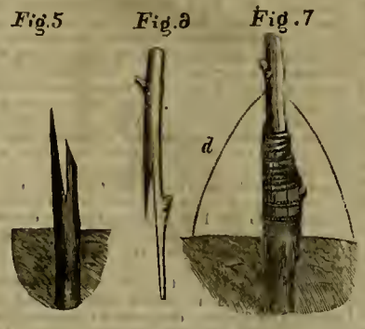

Fig. 5 Fig. 6 Fig. 7

a "dry year" will put in their grain as soon as the ground is ready, whether figures prove that they are correct or not. We know that in older settled countries than California, where accurate records are kept of the rain-fall, they are unable to prove with any degree of probability what the coming season will be; and we are therefore of the opinion that it is of little use yet to prognosticate, taking the rains of former season's as a basis of calculation. These are "weather wise" here as well as in older communities, and no argument would change their own opinions, as this is a subject on which every one thinks he knows best. We therefore

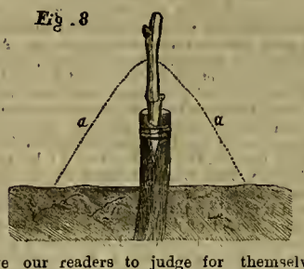

Fig. 8

leave our readers to judge for themselves, knowing at the same time that our friends, the farmers will take advantage of the early rains.

MARIPOSA AGAIN.—In another column will be found notice of the articles of incorporation of the Mariposa Land and Mining Co., which proposes to acquire the famous Mariposa property. One peculiarity of the new arrangement is given as follows: "Fifty thousand shares shall be designated as 'preferred' stock, and the holders of such shall receive dividends from the net receipts and earnings of any current year, if such net receipts and earnings will pay the same to the amount of ten per cent. per annum on nominal par value thereof, in preference to any dividend upon the re-

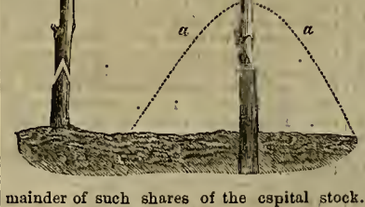

Fig 9 Fig 10

mainder of such shares of the capital stock. If such earnings and receipts shall not pay ten per cent., then such dividends shall be paid in such fifty thousand shares of the stock as the same will pay yearly."

A RAILROAD meeting was held at Nevada, Marin county last week, to consider the desirability and feasibility of building a railroad from San Rafael to Petaluma and beyond, and maintaining a ferry. Mr. Wickersham, banker, of Petaluma, was called to preside. Wm. T. Coleman, having been called upon, addressed the meeting at length. He explained the necessity of the line; said it would pay, and must be built; that it would cost a half million of dollars, two hundred thousand of which he would pledge San Rafael to raise, which would leave two hundred thousand dollars to Petaluma and one hundred thousand dollars to the intervening country. If Sonoma would come in and add enough to stretch the rail to her doors, by all means receive her, and so of Napa. Mr. Wickersham said that he felt authorized to say that Petaluma would respond in the sum named, and Mr. Sweetzer said that the county would do its share.

San Francisco Tanneries.

The first tannery established in this city after it was settled by the Americans was started in 1849 by an enterprising German, appropriately named Harnis. His tannery was beside "Washerwoman's Lagoon" on the old Presidio road. It was an establishment suited to the times, but little leather being used then, except that which was tanned in a rude way by the Mexican population. The stock imported was heavy, and some of it remaining unsold for over a year was re-shipped East—one lot of it amounting to 5,000 sides. This being the case, of course a small factory was considered sufficient to supply the demand. Another tannery was afterwards started by the firm of Le Gattis, McKay & Smith, on the opposite side of the lagoon from that of Harnis. Then follow the tanneries of J. J. Fulton, Wm. Fields and others.

The tanning business of this city has of late years grown to large proportions, and is now one of the prominent interests. Many of the tanneries are situated out on Mission creek, near 17th and 18th streets. The neighborhood is not an aristocratic one, and the surroundings are more useful than ornamental. The creek itself is not such a stream as a painter would like to depict, and the bridges which span the noble stream are of a natural order of architecture suitable to the locality. These circumstances, however, are not detrimental to the tanning business, which flourishes as well in one locality as another.

McAlser's tannery is in this vicinity, where it has been in operation about five years, doing a good business. They tan about 150 sides of sole and harness leather per week, when at that kind of stock, and at other times putting into the market about 180 sides of upper leather. From 12 to 15 hands are employed here and the business foots up to about $30,000 per annum.

The tannery of A. B. Patrick is on the southwest corner of Folsom and 18th streets. This tannery is a very large one, the main building being 180 feet on 18th street and 150 on Folsom. There are 100 vats, each containing 3,000 gallons. The works are run by a 60 horse power engine, which runs two pumps, a bark mill, rolling mill, press, etc. The pumps discharge 300,000 gallons per day. The rolling mill will smooth 160 sides per day. A strong liquor is made in which the hides remain for 24 hours. This liquor is then pumped off and new liquor run in. The used liquor is drawn into two capacious "junks" of 10,000 gallons' capacity, and is then pumped into the leaches, etc.

It takes about four months to thoroughly tan their leather, so that from the beginning of the process until the proprietor receives his money is from six to seven months. This tannery turns out 150,000 sides of sole leather and 2,000 sides of harness leather annually. We saw at this establishment a splendid lot of 400 hides finished and ready for delivery; and also a large quantity of very fine seal and dog skin leather. The heaps of wool, rawhide from the Sandwich Islands, piles of stock, and the general neatness indicate a prosperous business. Heavy leather being in demand, is made chiefly at present, but they have every facility for the manufacture of every description of upper leather of a superior style. The ground and buildings of this tannery are owned by A. B. Patrick, the proprietor.

Artificial Wine.

Complaints about the adulteration and dilution of foreign wines are not new, and their truthfulness has been generally conceded, but it now appears that the art of making wine has at length reached that point of perfection where the grape can be dispensed with altogether. A Strassbourg paper complains of the production of artificial wine at Kehl, where there is a large establishment, much patronized by Strassbourg wine-merchants, into which a grape has never entered. This colored and sweetened Rhine water is recognized by the excise as grape wine. In the Rheingau and the Palatinate there are hundreds of similar establishments. The Rhenish and Alsatian wine-growers intend to urge the Reichstag to pass a stringent law against the falsification of wine and other drinks.

The American people have their faults; but this is not one of them; and among the "Yankee tricks" that have become famous, we find but few instances of the falsification and adulteration of articles of commerce. It is not an American vice; and we have faith that California wines will achieve and maintain a good reputation in the world's markets.

THE SOCIETY OF ENGINEERS of California met last Tuesday evening, at which time S. H. Wheeler read a paper on "Quartz Mill Machinery." The President announced a paper on the "Properties of Steam" for the next meeting.

THE stages between Nevada City and North San Juan will only run tri-weekly during the winter.

The Fall of the Leaf.

The phenomenon of the "fall of the leaf," common ae it is, is very difficult to explain eatisfactoriiy. The following are the facts, eo far as we nnderstand them, which are exceedingly interesting and inetructive: It seems that natnre begins the provision for separation almoet ae soon as the leaf is horn, in epring. When first put forth into the atmoephere, the stalk of the leaf, enpposing one to be preeent, is continuoue with the stem. Ae the leaf and its etem grow, however, an interruption between their tissuee (fibrous and cellular) occurs at the base of the leaf stalk, by meane of which a more or lese complete articulation or joint is gradnally and ultimately formed. This articulation is produced hy the continuation of the growth of the atem after the leaf has attained its full growth, which it generally does in a few weeks. The growth of the leaf being completed, the base of its petiole, or foot-stalk, is no longer able to adapt itself to the increasing diameter of the stem, and a fracture hetween that base and the stem necessarily eneues; the excision advances from without inward, until it finally reachee the bundles of woody fiher which form the main support of the leaf. While, however, natnre is forming a wonnd, she is at tbe same time making provision to heal it, for the cuticle or epidermis of tbe stem is seen to grow over the surface of the ecar, so that when the leaf ie detached the tree does not suffer from the effects of an open wound. The provision for separatiog being tbne completed, the leaf is parted from the etem by the growth of the twig at tbe bud hase. the force of the wind or even hy its own weight. Therefore as soon as tbe glorious colors of the autnmn leaves begin to fade, this provision for separation is completed, and the winds sing their death dirge ae they carry them away from their eummer'e home, on the branchee of the trees, and scatter them in countlese nnmbere upon the ground. The fall of the leaf is therefore the regular vital process, which commencee with the firet formation of the leaf, and is ouly completed when it ie no longer useful to the tree. There is no denying, however, tbat the froste of autnmn, by suddeuly contracting the tiseues at the base of the leat etalk, accelerate the fall of the leaves. All must have noticed on a frosty morning in antumn that the slightest breath of air moving among the decayed and dying leaves will bring them in complete ehowers from the treee to the ground. The leaves of the beech, hornbeam and oak die in autumn, but frequently remain attached to theee trees throughout the winter months, provided that the treee are not so situated ae to be exposed to violent winds. Such leaves when examined will be found to be continnous with the stem, and therefore without that articulation or joint which eo naturally assiets in the separation of the leaf from the tree. Those dead leaves fall off when the new leavee are put forth in epring; they are in fact pu hed off by the expansion of tbe stem when the growth of the season commences. The leavee of evergreen trees and shrubs, and of coniferoue trees, as the pine and fir, do not fall in autnmn, but in epring, when the growth of the season ie proceeding; and as thie annual leaf-fall is only partial, coneisting of one-half or one-third at a time, there ie always a sufficient nnmber of leaves on ench trees to keep them clothed with perpetual verdure. Hence it ie that their foliage consists of leavee which have been attached to tbe stem from one to three or five succeseive yeare.—*London Garden*

Columbia District.—The *Silver State* eays: Charley Kyle and General Harris have juet returned from a hunting expedition in the northwestern part of the county. They report game plenty in that section, and, as trophiee of their succees, brought in a lot of venieon. From Kyle we learn the following relative to the miuing proepecte of Bartlett creek and Columbia district, which places they visited while hunting: Work has been commenced systematically on the Badger mine, a large interest in which wae recently purchased by Mr. Bollinger, of San Francisco. A few daye ago George Keating eold his interest in the mine, which comprised one-eixth of it, to a Mr. Johnson, of Baker City, Oregon, for $10,000. The new owners have enrveyed and commenced work on a ditch from Bartlett creek to an eligible site near the mine, for the purpose of running a quartz mill. The creek contains sufficient water at all seasons of the year to run a 20-etamp mill. Kyle speaks in the highest terme of tbe couutry, and believes, now that capital is intereeted, that next season there will be a flourisbing mining town in Columbia district. The country eurrounding the mines afforde excellent paetnrage for cattle, large herds of which are seen in the valleye.

Oconto, in Wieconein, promiees to rival the Black Hille or any other gold mining district in the conntry. The following is from the Oconto *Reporter:* It ie an indisputable fact that gold, in paying quantities, has been diecovered on the north branch of the Oconto river, which in purity and riohness has been pronounced by old California miners not to be surpaseed by any gold ever discovered on the Pacific ooaet. For reasone that we are not at preeent at liberty to divulge, this discovery has been kept quiet, but in the courre of a few weeks all unhelievers and scoffers will be made acquainted with the truthfulness of thie statement, as arrangemente are being made for the opening and working of the mine.

Manzanita Mine.

The heavy rain of Mouday and Tuesday had the effect to give the ground a good soaking. Quite a cave occurred on the weet side of the cnt in the Manzanita claims, and an acre of ground, more or lees, was tumbled down and brokeu np, ready for hydraulicing when water comes. Tbis mine ie in eplendid order for working now, better than it ever wae before, and the general arrangement of the worke, and the systematic manner in which tbe claime have been worked to bring them to a first-clase paying mine, reflecte great credit upon the superintendent, Mr. W. A. Roherte, who hae, for the paet two years, hattled againet many apparently insurmountable obstacles, and snceeeded in bringing order out of chaoe and making the Manzanita a paying mine. The claime are all ready for work when water comes, and it is the intention this season to rnn more water and use more gunpowder. Two more powder drifts are heing run, and the immeuse bank of gravel, one hundred and sixty feet high, will be hroken up all over a dietance of two hundred feet back, thus rendering the gravel easier to be dissolved. The bed-rock is still pitching slightly into the hill, showing that the deepest part of the channel has not yet been reached. There is still plenty of fall, however, to the claime, for the lower tunnel at the end of the ground sluice is from thirty to forty feet helow the hed-rock. Thie tunnel will be nsed for running off bottom dirt, and all the gravel on the north and weet sides of the claime, while the upper tunnel, which is some twenty feet above the bed-rock, will be used for conveying away the gravel from the east portion of the miue. Two monitors are used and eight hundred inches of water are forced throngh each of them. Tbe company's office, blackemith shop, powder honse and other buildinge, are conveniently arranged, and when Jupiter Pluvius eende efficient moisture to fill the Snow Mountain ditch with water, piping will begin, and old Manzanita will be made to disgorge the golden treaenres which are known to he in its poeseesion.—*Nevada Transcript.*

Steam Packing.—An English writer recommends well-sifted white-wood sawdnet, cnt with the grain and mixed with talc or plnmbago, ae a good material for eteam packing. Another writer eays in regard to it, "Tbis ie, in itself, a good anti-friction material, but I do not think the addition of plnmbago would he of any uee. I fear, however, that the action of eteam would eoon destroy the elasticity, and make it like a ring of eolid wood. Once, heing in a hurry to pack the gland of a piston-rod, I filled tbe etnffing-box with finely chopped etraw. Not the leaet steam escaped tbrough the interaticee, and it required hut very little compreseion, the mere weight of the gland serving to keep it steam-tight. I thought I had made a good discovery, that would save a continual eource of tronble, bnt at the end of a few daye' work the straw suddenly went rotten by the continued action of the steam, and blew out like coffee-grounde. Oat-husks are more enduring, and equally eteamtight. The experiment proved that a continuoue yarn gasket is not essential for steam packing, but that small pellete of something or otber having elasticity and eteam-enduring properties will do eqnally well, and be far more easy to extract than old hard junk, to hook out which to tbe very bottom ie sometimee a tronbleeome job."

Lida Valley.—A correspondent of the *R.R. Reveille* eaye: At no time since the settlement of thie valley has tbe outlook of the mining interest been so gloomy ae at preeent. No work is being done on any of the mines save and except the Brown'a Hope, on which Superintendent Higge has a crew of two men at work on contract. The mill, wheu running (now sbut down for repairs), is working the refuee ore or waste dumps of the Brown'e Hope mine and givee employment to eight or nine men, including officere. Gen. Page has machinery here for another mill; bnt when or where it will he set up we know not. Messrs. Kelly & Oher, the fortunate owners of eome very rich gold-bearing ledges in the Gold Mountain district, are building an arrastra-mill between Lida and Gold Mountain for the redncticn of their ore. The motive power of the mill will be steam. Owners of minee in Lida Valley district bide their time, confident in the merits thereof.

Oriental Mill.—The Nevada *Transcript* learns from Mr. Kitts, proprietor of the Oriental mill that he has crushed abont 1,000 tons of custom rock the past summer. Most of it was prospect rock, taken from Gold flat, Wood's ravine, from the Montana ledge and other places. The rock hae all averaged abont $25 per ton. The mill ie run by eteam power and has an engine of 30 horse power. The gold is saved by meane of copper slnices and Eureka rubbers. Mr. Kitte understands the working of rock and eaves the proceeds as closely as it is possible to do. The mill will run ae occasion requires during the winter.

The Milton mining company are pnshing work on their Milton and Moore'e Flat ditches ae rapidly as possible. Between Moore'e Flat and Eureka they have 500 men at work, and above Eureka the ditch is completed. The recent rains have given an impetus to the work, as fears are entertained that the rainy season has actnally commenced.

The Conenlidated Virginia bullion ie worth $31.50 per ponud.

Machinery.

BALL'S SWEEPING DREDGE,

A NEW AND VALUABLE

CALIFORNIA INVENTION,

Has been very lately well proven by performing a job of dredging at the mouth of San Antonio Creek, at Oakland, Cal.

There is but tbis one machine tbat has ever had these improvements employed. It is an old machine, formerly built for another device, and is unfavorably constructed for Ball's improvements; yet this first temporary experimental machine has filled a scow of eighty-five cubic yards in sixteen minutes in unfavorable digging. For durabillty, digging hard material and fast work, it bas a reputation (supported hy leading engineers) as having no eqnal.

Testimonials and references will he given on application to the inventor, who is the sole owner of patents (excepting having made an assignment of the one machine now belonging to the Central Pacific Railroad Company). Having resolved not to sell any rights unless upon a *basis* of actual work performed hy a machine built by myself for the purpose of fairly establishing the worth of the invention, I therefore offer to sell machines or rights on the following plan, which is warranting the capacity of the machine hy actual work:

I will enter into an agreement with any responsible party to build and sell a machine, scows and tender, all complete, and right of all my improvements in dredging machines throughout the Pacific Coast for $20,000, warranting the machine to dredge six cnbic yards per minute (to fill a scow at that rate). $20,000 will but little more than pay the cost of building the machine, scows, etc., all complete; therefore I am proposing to ask *nothing* for my patents unless my machine dredges more than six cubic yards per minute. But it shall be fnrther agreed that in case (at a fair trial to be made within a stated time) the machine shall fill a scow at the rate of more than six cubic yards per minute, then $10,000 shall be added to the price above stated for each and every such additional cubic yard thus dredged per minute, and for additional fractions of a cnbic yard thus dredged in the same ratio the $10,000 is to he added to said price above stated.

I will sell any other Territorial or State rights (either United States or Foreign) upon the same plan and at a lower price proportionately than the rights for the Pacific Coast.

I will sell a single machine with scows and all complete, and right to use the same in a limited territory, for $20,000 on the same plan as above stated, but will add only $2,000 to each additional yard over the six cubic yards per minute. Each machine is not to employ more than two 10x20 inch engines.

Payments to he made in U. S. gold coin on delivery of machine, as may be indicated hy agreement.

Address, JOHN A. BALL,
9v28-tf Oakland.

Miscellaneous.

Froiseth's New Sectional, Topographical and Mineral

MAP OF UTAH.

Size, 40 by 56 Inches; Scale, 8 Miles to an Inch.

Handsomely engraved on stone, colored in counties and mounted on cloth, showing the Counties, Towns, Rivers, Lakes, Railroads, Mines and Mining Districts throughout the Territory, and all Government Surveys made to date. Price, mounted, $8; Pocket form, $5.

—ALSO—

New Mining Map of Utah,

Sbowing the boundaries of the principal mining districts, some 30 in number, adjacent to Salt Lake Olty. Price, pocket form, $2.50.

—ALSO—

Froiseth's New Map of Little Cottonwood Mining District and Vicinity.

Sbowing the location of some 400 mines and tunnel sites, together with the mines surveyed for U. S. Patent. Price $3. For sale and mailed to any part of tbe globe, on receipt of price, hy A. L. BANCROFT & CO., A. ROMAN & CO., and LeCOUNT BROS. & MANSUR, San Francisco. 10v25-tf

Ayer's Cherry Pectoral,

For Diseases of the Throat and Lungs, such as Coughs, Colds, Whooping Cough, Bronchitis, Asthma and Consumption.

The few compositions, which have won the confidence of mankind and become bonsehold words, among not only one, hut many nations, must have extraordinary virtues. Perhaps no one ever secured so wide a reputation, or maintained it so long, as Ayer's Cherry Pectoral. It has been known to the public about forty years, by a long continued series of marvellous cures, that have won for it a confidence in its virtues, never equalled hy any other medicine. It still makes the most effectual cures of *Coughs, Colds, Consumption*, that can he made by medical skill. Indeed the Cherry Pectoral has really robbed these dangerous diseases of their terrors, to a great extent, and given a feeling of immunity from their fatal effects, that is well founded, if the remedy he taken in season. Every family should have it in their closet for the remedy and prompt relief of its members. Sickness, suffering and even life is saved by this timely protection. The prudent should not neglect it, and the wise will not. Keep it by you for the protection it affords by its timely use in sudden attacks.

TEATS' PATENT FURNACE.

TEATS' PATENT FURNACE

For Roasting, Desulphurizing, Chloridizing and Oxidizing Ores, etc. For the reduction of Gold, Silver, Lead and other ores, saving a larger percentage, at less cost, than any other invention now in use. Chloridizing Silver ore more thoroughly, in less time, with less fuel, salt and labor; also roasting Lead ore preparatory to smelting, better and cheaper than any other invention. The Furnace is so constructed that one man, of ordinary ability, tends five or more furnaces; controls them with ease; adding heat or air; stopping or starting at will; charging and discharging with ease. Also, Patent "Conveying Cooler," for conveying and cooling roasted ores, heating the water for amalgamation and the boilers at the same time. Saving the large space in mill (covered with brick or iron), and the labor of two men per day, exposed to the poisonous chlorine gases. Also, Patent Air Blast "Dry Kiln," for drying ores direct from the mine or breaker, saving fuel and labor heretofore necessary in drying ores for dry pulverizing. For description refer to MINING AND SCIENTIFIC PRESS, No. 18, October 31, 1874. For particulars address

TEATS & BREED,
No. 12 West Eighth Street, Cincinnati, Ohio.

Circulars, &c., will be furnished, if required.

General News Items.

THE ELECTIONS.—Twenty-four states held their elections on Tuesday last, at which eleven governors were chosen, 17 legislators elected, 218 members of Congress. The contest was generally between Democrats and Republicans—although in South Carolina both tickets were nominated by Republicans and in Missouri both by Democrats. The result has surprised every one, and forms one of the most complete revolutions which the country has ever experienced. The power of the administration has been broken in the Senate, while the position in the House has been advanced from one third of its membership to two-thirds. The legitimate inference is indicative of a deep rooted dissatisfaction with the present management of Federal affairs at Washington. What effect it will have on the coming election of President is as yet uncertain, and will largely depend on the action and spirit developed at the next session of Congress. Happily California is relieved this year of the excitements and bad blood generated by such a political campaign. Perhaps one of the best features developed by this election is the disposition so generally manifested by the people everywhere to ignore party and vote independently upon living issues. It is also gratifying to notice that the colored voters of the south are beginning to break away from their clannishness, and divide their support between the two opposing parties. This fact shows that they have opinions of their own, which they are prepared to hold and exercise even though they conflict with those whom they have hitherto regarded as their only friends.

EPIDEMIC AMONG THE CELESTIALS.—The past summer has been one of great mortality among the Chinese in the mines at Oroville. It is said that the deaths during the summer will reach nearly seven hundred, and that at the present time there are about three thousand sick. The epidemic commences with a swelling in the lower limbs, gradually going up over the body to the throat, when death in nearly every case follows. The Chinamen are leaving the locality by the car load. As yet the epidemic has not got among the whites. Very little is known as yet, with regard to the origin or nature of the disease.

THE "City of Pekin," reported last week as having put into Rio Janeiro to replace two blades which she had lost from her propeller, after lying there several days without being able to use her coffer dam for making repairs on account of rough weather, put to sea again determined to rely upon the good condition and strength of those which remained for the completion of her voyage.

PUBLIC SCHOOL NOTICE.—State Superintendent Bolander warns Boards of Education against changing the course of study adopted by the State Board, and notifies all Trustees that the law in regard to the course of study will be strictly enforced; and any school district which neglects to adopt the State course can receive no apportionments of the school money.

A MOST EXTRAORDINARY ATROCITY was committed a few days since at a house in Virginia Place in this city. Louis Berry, a respectable colored man was murdered by his son, a man 33 years of age, and horribly mutilated by an axe and dagger. The criminal has been arrested. No cause or provocation is given for the commission of the foul deed.

SNOW IN THE EAST.—A very severe snow storm visited the northwestern portion of Pennsylvania, on the 30th ult. Nine inches of snow fell at Erie. November is generally a miserable month for our friends in New England and the Middle States. Cold rains, raw winds, freezing, thawing, "slush" and mud—ugh!

COUNTY JUDGE.—The Governor has appointed Selden S. Wright to be County Judge of San Francisco county, to fill the vacancy created by the resignation of Judge Stanly. Mr. Wright has been Probate Judge of this county, and was at one time a candidate for the Supreme Court on the Democratic ticket.

JOHN COCHRAN, the Master of the Patrons of Husbandry of the State of Wisconsin, has declined the Republican nomination for Congress, in his district, on the ground that it is a trap laid to draw the Patrons of Husbandry, as an Order, into politics.

LABOR TROUBLES IN ENGLAND.—There is still much trouble among mining and agricultural laborers in England. Farmers of Lancashire insist upon reducing the wages of the men three shillings per week. A serious agricultural lockout is expected.

THE CARLIST WAR.—The Carlists are said to be negotiating for an armistice. Another dispatch says that several leading Carlists have waited upon Don Carlos at Tolosa, and reported to him that it is useless to continue the war.

PROF. HILGARD, of Michigan University, who temporarily supplied the chair of Agriculture at the University after Prof. Carr's removal, has been invited to fill it permanently by the board of regents.

SUICIDE.—Henry Sustan, an elderly German, committed suicide in a shanty on Fifth avenue, between L and M streets, South San Francisco, a few days since.

NARROW GAUGE LOCOMOTIVE.—Moynihan & Aitken, of the Portland Boiler Works, of this city, have just completed a narrow gauge locomotive, designed by W. W. Vanderbilt, formerly Superintending Engineer of the Pacific Mail Steamship Company. This locomotive is intended to run on a narrow gauge railroad built for one of the coal mines in Coos Bay. The cylinder is 7½ inches in diameter, 14-inch stroke. There are four drivers 36 inches in diameter. The boiler shell is 36 inches in diameter, and 12 feet long. The locomotive is calculated to draw 40 coal cars.

CASE OF CREMATION.—During a warm shower of rain last week, a man who was hauling a load of lime in Sonoma county, had his cargo set on fire in consequence of the heat given out by the lime in absorbing the rain. One of the mules stubbornly resisted all efforts to detach him from the burning wagon and was cremated on the spot, while his unfortunate owner stood by and misapplied scripture.

PACIFIC COAST APPROPRIATIONS.—The Congressional appropriations asked for the Pacific coast for the present year are as follows: Fort Point, $50,000; Lime Point, $50,000; Alcatraz Island, $50,000; the mouth of the Columbia river, $20,000.

MURDERED HIS BROTHER'S WIFE.—Levy Thornton murdered his brother's wife at Day's Hollow, near Binghampton, New York, on Sunday, by cutting her throat, because she refused to elope with him.

SAN FRANCISCO HARBOR.—During the month of October, 412 vessels of all classes entered the harbor of San Francisco: Steamers, 90; ships, 71; barks, 27; brigs, 7; schooners, 210; men-of-war, 5, foreign fishermen, 4.

THANKSGIVING.—The President has designated the 29th day of November to be set apart as a day of National Thanksgiving for all the many blessings enjoyed during the past year.

TROOPS FOR THE SOUTH.—Government is unable to comply with the demand for troops to keep the peace at the South, on account of the smallness of the number at its disposal.

AN EXPENSIVE CITY.—New York's expenses for the coming year are estimated at $38,693,052 65, a reduction of $2,000,000 over the previous year.

THE GENERAL POSTOFFICE.—The Postoffice department has abandoned the idea of making the department self-sustaining, for the present at least.

GARIBALDI PROVIDED FOR.—The municipality of Naples proposes to tender to General Garibaldi an annuity of $60,000.

THE DEATH RECORD.—Eighty-four deaths have occurred in this city during the past week—54 males and 30 females.

THE rush of immigration to California is greater this fall, than at any time since the "days of '49 and '50."

POWDER EXPLOSION.—Another tremendous powder explosion occurred in London on the 3d inst., by which four persons were killed.

THE war cloud in Europe seems to increase in blackness.

PATENTS & INVENTIONS.

A Weekly List of U. S. Patents Issued to Pacific Coast Inventors.

[FROM OFFICIAL REPORTS FOR THE MINING AND SCIENTIFIC PRESS, DEWEY & CO., PUBLISHERS AND U. S. AND FOREIGN PATENT AGENTS.]

By Special Dispatch, Dated Washington, D. C., Nov. 3rd, 1874.

FOR WEEK ENDING OCT. 20th, 1874.*

VENTILATING BLANE FOR ILLUMINATING TILES.—Wm. Lynch, S. F., Cal.

CAR AXLE BOX.—Josiah C. Tuck, Oakland, Cal.

CARRIAGE AND WAGON WHEEL.—Wm. H. Keep, Stockton, Cal.

SEWING MACHINE.—Eugene Morean, S. F., Cal.

TRADEMARK.

FOR TEAS.—Albert Mau & Co., S. F., Cal.

*The patents are not ready for delivery by the Patent Office until some 14 days after the date of issue.

NOTE.—Copies of U. S. and Foreign Patents furnished by DEWEY & Co., in the shortest time possible (by telegraph or otherwise) at the lowest rates. All patent business for Pacific coast inventors transacted with perfect secrecy and in the shortest time possible.

A COMPLIMENT.

PLAINSBURG, MERCED CO., CAL., June 22, 1874.

DEWEY & CO.—*Gentlemen:* I herewith tender my grateful acknowledgements for the energy, promptness and efficiency which you have displayed in procuring my patent.

Although you were entire strangers to me when I first communicated with you, I soon felt satisfied you were gentlemen of integrity, and shall always be happy to represent you as such. Very truly yours,

H. W. RUCKER, M. D.

Wood Cuts for Sale.

We are willing to sell a large number of the wood cuts and electrotypes which have appeared in the PRESS, on very liberal terms to publishers abroad, and would invite correspondence on that business.

FOR STATE OF NEVADA.—We have appointed Mr. F. B. Alderson our special agent and correspondent for the State of Nevada. He will visit our friends and patrons there soon.

The Mining and Scientific Press--Ever Onward.

Our careful system of compiling, judiciously condensing, and conveniently arranging into regular departments, has been heartily endorsed. It renders the paper worth more to readers, who can find handily that which interests them most.

The weekly issues of the PRESS will contain reliable

Information for Practical Miners,

Treating on the Opening of Mines; Mining of Ores; Milling of Ores; Smelting of Ores; Separation and Roasting of Ores; Amalgamation; Saving of Gold and all precious Metals; New Processes of Metallurgy; New Discoveries of Mines; Mining Engineering and Hydraulics.

For Inventors, Mechanics and Manufacturers.

All new and important developments in Scientific and Mechanical Progress; Patents and Inventions of the Pacific States; Progress of Home Industries; Hints for Local Manufacturers; Illustrations of New Machinery; Reports of Popular Scientific and Industrial Lecturers.

Our Mining Summary

Gives the progress of mining work from week to week in the various counties and districts throughout the principal mining regions of the United States, arranged in alphabetical order. It is the most extensive record of mining operations published in the world. It affords the intelligent miner a rare opportunity to know and profit by the work and experience of his neighbors. Miners have few sources of practical information in their calling, and should embrace every reliable means for improvement. Mining Operators and Shareholders, at home and abroad, weekly examine our Summary with increased interest and profit.

Our "Domestic Economy"

Embraces new and important facts which should be known in every cabin and household. Short and interesting—the articles under this heading are freely read and practiced with profit and improvement to the readers.

The PRESS is not strictly a "paper for professional scientific men," but rather a

Liberal and Popular Scientific Journal,

Well calculated to make practically scientific men from our intelligent masses. This is our stronghold for accomplishing good. Plain, correct and pleasing language, easily comprehended by all, confined mostly to short articles, is our endeavor.

For Self-Improvement,

Every issue of the PRESS abounds with articles of an elevating character, to stimulate the higher virtues and natures and progressive intellects of both men and women.

Hundreds of Dollars

Are oftentimes saved to the readers of this paper by a single hint or article of information in its columns; Such instances have been repeatedly reported to the editors and proprietors during their long connection with the PRESS. Our paper presents

The New and Novel Developments

In this progress of this comparatively new section of the Union (but recently settled and now rapidly increasing with a population of the most intelligent and venturesome people, attracted from nearly every quarter and clime on the globe), snails us, with due enterprise, to display vigor and freshness in our columns not met with in similar journals elsewhere. The same circumstances also render such a paper more especially valuable to its readers in a new, and, to a certain measure, untried field, where the best methods and processes of industry are not so well established or traditionally known as in older communities. Published experiences often save costly experiments and disastrous results.

A Great Variety of Industrial Information,

In brief and fresh form, suited to the wants and tastes of the readers of this coast, which is not obtainable otherwise so timely, or in so cheap and convenient form. As an industrial publication, meeting the wants of so many kindred industries, this journal stands pre-eminent and without a precedent.

Subscriptions payable in advance—$4 per annum. Single copies, post paid, 10 cents. Address

DEWEY & CO.,

MINING AND SCIENTIFIC PRESS and PACIFIC RURAL PRESS Office, 224 Sansome St., S. F.

Hints about Advertising.

If you have goods to sell farmers, how much better will it pay you to advertise in a farming paper, closely read by 15,000 intelligent farmers, than in miscellaneous daily or weekly journals with 30,000 readers, comprising only 2,000 farmers. A mining journal in California with 15,000 readers reaches more intelligent miners than any other 10 papers in the Union.

Purchasers are more likely to look for information in the advertising columns of a paper devoted to their special interests, than elsewhere, when ready to buy. Some will not read advertisements upon any other occasion, but seek the best paper when wanted.

If you happen to be the only advertiser in your line of business in a paper, all the better. But if several firms advertise the same, your own judgment will question whether you can best afford to go unrepresented.

Weekly journals are read most leisurely and carefully, and at a time when the subscriber is most favorably inclined to examine advertisements. The newspaper most specially representing your particular branch of industry is usually best entitled to your patronage, and the most profitable medium you can employ.

An advertisement in an honest and handsome sheet is favorable to the reputation of the advertiser. The readers of the PRESS are a superior and industrious class, who are able to purchase and who seek to patronize the best and fairest dealing tradesmen.

Advertising in cheap priced mediums (of limited circulation) is like buying goods at retail when you could as well take them at wholesale.

Information imparted to a list of superior and intelligent and active and industrious readers (naturally looked up to by others for information), is seed sown in good soil for the advertiser.

Fame and fortune are gained, nine times in ten, by liberal and judicious advertising.

PACIFIC RURAL PRESS,

A first-class 16-page Agricultural Home Journal, filled with fresh, valuable and interesting reading. Every farmer and ruralist should take it. It is immensely popular. Subscription, $4 a year.

DEWEY & CO., Publishers,

No. 224 Sansome street, SAN FRANCISCO

DEWEY & CO.

American & Foreign Patent Agents,

OFFICE, 224 SANSOME STREET, S. F.

PATENTS obtained promptly; Caveats filed expeditiously; Patent reissues taken out; Assignments made and recorded in legal form; Copies of Patents and Assignments procured; Examinations of Patents made here and at Washington; Examinations made of Assignments recorded in Washington; Examinations ordered and reported by Telegraph; Rejected cases taken up and Patents obtained; Interferences Prosecuted; Opinions rendered regarding the validity of Patents and Assignments; every legitimate branch of Patent Agency Business promptly and thoroughly conducted.

Our intimate knowledge of the various inventions of this coast, and long practice in patent business, enable us to abundantly satisfy our patrons; and our success and business are constantly increasing.

The shrewdest and most experienced Inventors are found among our most steadfast friends and patrons, who fully appreciate our advantages in bringing valuable inventions to the notice of the public through the columns of our widely circulated, first-class journals—thereby facilitating their introduction, sale and popularity.

Foreign Patents.

In addition to American Patents, we secures with the assistance of co-operative agents, claims in all foreign countries which grant Patents, including Great Britain, France, Belgium, Prussia, Austria, Victoria, Peru, Russia, Spain, British India, Saxony, British Columbia, Canada, Norway, Sweden, Mexico, Victoria, Brazil, Bavaria, Holland, Denmark, Italy, Portugal, Cuba, Roman States, Wurtemberg, New Zealand, New South Wales, Queensland, Tasmania, Brazil, New Grenada, Chile, Argentine Republic, AND EVERY COUNTRY IN THE WORLD where Patents are obtainable.

No models are required in European countries, but the drawings and specifications should be prepared with thoroughness, by able persons who are familiar with the requirements and changes of foreign patent laws—agents who are reliable and permanently established.

Our schedule prices for obtaining foreign patents, in all cases, will always be as low, and in some instances lower, than those of any other responsible agency.

We *can and do* get foreign patents for inventors in the Pacific States from two to six months (according to the location of the country) SOONER than any other agents.

Home Counsel.

Our long experience in obtaining patents for Inventors on this Coast has familiarized us with the character of most of the inventions already patented; hence we are frequently able to save our patrons the cost of a fruitless application by pointing them to the same thing already covered by a patent. We are always free to advise applicants of any knowledge we have of previous applications which will interfere with their obtaining a patent.

We invite the acquaintance of all parties connected with inventions and patent right business, believing that the mutual conference of legitimate business and professional men is mutual gain. Parties in doubt in regard to their rights as assignees of patents, or purchasers of patented articles, can often receive advice of importance to them from a short call at our office.

Remittances of money, made by individual inventors to the Government, sometimes miscarry, and it has repeatedly happened that applicants have not only lost their money, but their inventions also, from this cause and consequent delay. We hold ourselves responsible for all fees entrusted to our agency.

The principal portion of the patent business of this coast has been done, and is still being done, through our agency. We are familiar with, and have full records, of all former cases, and can more directly judge of the value and patentability of inventions discovered here than any other agents.

Situated so remote from the seat of government, delays are even more dangerous to the inventors of the Pacific Coast than to applicants in the Eastern States. Valuable patents may be lost by the extra time consumed in transmitting specifications from Eastern agencies back to this coast for the signature of the inventor.

Confidential.

We take great pains to preserve secrecy in all confidential matters, and applicants for patents can rest assured that their communications and business transactions will be held strictly confidential by us. Circulars free.

Engravings.

We have superior artists in our own office, and all facilities for producing fine and satisfactory illustrations of inventions and machinery, for newspaper, book, circular, and other printed illustrations, and are always ready to assist patrons in bringing their valuable discoveries into practical and profitable use.

The Pacific Rural Press

Is a Large and Handsomely Illustrated Agricultural Homs Journal; Original, Instructive and Attractive; its varied contents, ably written and condensed, render it popular with its readers. We endeavor to make it a credit to the field it occupies, and to every intelligent circle it enters. ENTIRELY FREE FROM POLITICS, its columns are filled with cheerful words of encouragement for our Pacific Industries and instruction for the people. It extends information of the growing wants and necessities of our rapidly increasing and progressing agriculturs. You can rend it with pleasure, for present and future profit; you can send it with satisfaction to your friends anywhere. Its editorials are earnest and its contents reliable. No questionable advertisements darken its pages. It is a journal for rural homes throughout the Coast. It is a handsoms homs print, without a rival on this half of the Continent. Subscription, in advance, $4 a year.

DEWEY & CO., Publishers,
No. 224 Sansome St., S. F. 3p-tf

The Mining & Scientific Press

Started in 1860, is one of the oldest weekly journals now published in San Francisco. It has been conducted by its present proprietors for ten years, during which period it has been repeatedly enlarged and constantly improved. The active and steadfast efforts of its publishers have gained for its conduct an amount of practical experience greater than any other publishers have accumulated on this coast, of a weekly journal.

The sum paid by us for the best editorial talent obtainable for our special class journal; for engravings, for interesting news and correspondence, and for printing a large-sized, handsome sheet, is unequalled by that of any other American weekly west of the Mississippi.

As a PRACTICAL MINING JOURNAL it has no rival on this Continent.

It is the only MECHANICAL, and the only SCIENTIFIC journal of the Pacific States.

Miners, Assayors, Millman, and Metallurgist in the United States should take it.

Pacific Coast Mechanics, Engineers, Inventors, Manufacturers, Professional Men, and Progressive and Industrial Students should patronize its columns of fresh and valuable information.

Mining Engineers, Superintendents, Metallurgists, Mine Owners and Mine Workers throughout the world should profit by its illustrations and descriptions of New Machinery, Processes, Discoveries and Record of Mining Events.

Intelligent thinkers throughout the land, in high or humble situation, who would avoid literary trash for genuine information, should SUBSCRIBE AT ONCE.

DEWEY & CO.,
No. 224 Sansome street, S. F.

SECOND EDITION—REVISED AND ENLARGED.

The Explorers', Miners' and Metallurgists' Companion.

Comprising a Practical Exposition of the Various Departments of Exploration, Mining, Engineering, Assaying, and Metallurgy.

Containing 672 Pages and 83 Engravings

BY J. S. PHILLIPS, M. E.,

Of California, a Practical Operator for Thirty-four Years; Explorer, and Resident in the Pacific States and Territories for the past Eight Years.

PRICE, bound in cloth, $10.50; in leather, $12. For warded by mail for 50c. extra, at the MINING AND SCIENTIFIC PRESS Office, by

DEWEY & CO.

Our Agents.

OUR FRIENDS can do much in aid of our paper and the cause of practical knowledge and science, by assisting Agents in their labors of canvassing, by lending their influence and encouraging favors. We intend to send none but worthy men.

FROM AN INVENTOR.

PLACERVILLE, October 3d, 1874.

MESSRS. DEWEY & CO.—*Gentlemen:* Yesterday I received from you my Letters Patent for my Hydraulic Mining Lamp, and I herewith tender you my grateful acknowledgements for the energy and promptness which you have displayed in working said invention through the Patent Office for me; and shall in the future, as well as the past, recommend all parties having inventions, to go direct to the office of Dewey & Co., and ask for Mr. Boone, in the Patent Department, and if he cannot procure a patent for them they will find it useless to try further. Yours Respectfully,

C. B. BROWN.

THE MINING AND SCIENTIFIC PRESS, San Francisco, we regard as the best paper for miners published anywhere in the world. Subscribers should be careful to put on file each number; and each year's edition, bound in a volume, would prove a most valuable book to all reading men engaged in mining or in the reduction of ores.—*Boulder News.*

PLAINFIELD, July 4th, 1874.

MESSRS. DEWEY & CO.—*Dear Sirs:* I acknowledge receipt of yours of 2d inst., inclosing my Letters Patent. I thank you for the interest you have taken in obtaining the same. Yours truly, M. W. OOON.

Location of Dewey & Co.'s New Offices since July, 1874.

Designing and Engraving at This Office.

We are prepared to do fine Wood Engraving for illustrating Landscape Scenery, Buildings, Machnery, Works of Art, Manufactured Articles, Trade Marks, Seals, Etc. We have a first-class

Machine for Engraving

A portion of the work, which can be finished thereby more perfectly than by the eye and hand alone. Our patrons can depend upon first-class work always, and at reasonable prices. Samples can be seen at our office.

DEWEY & CO.

AGENTS WANTED to canvass every town on the Pacific Coast for the MINING AND SCIENTIFIC PRESS, PACIFIC RURAL PRESS, and the ILLUSTRATED PRESS. Experienced canvassers preferred. Good men can make large wages besides learning much and improving their talents

To Mining Secretaries.

An amendment to Section 336 of the California Code, taking effect **July 1st, 1874**, provides that in addition to the regular publication of the assessment and sale notices as heretofore,

PERSONAL NOTICE

Must be served as provided in the following quotation from the law:

"The notice must be personally served upon each stockholder, or in lieu of personal service, must be sent through the mail, addressed to each stockholder at his place of residence, if known, and if not known, at the place where the principal office of the Corporation is situated."

The above refers to the ASSESSMENT NOTICE only. Advertisers in the MINING AND SCIENTIFIC PRESS will be furnished with copies of assessment notices printed on slips suitable for serving personal notice under this law at short notice,

DEWEY & CO., Publishers.

7v25-tf JOHN TAYLOR & CO.

Varney's Patent Amalgamator.

These Machines Stand Unrivaled.

For rapidity pulverizing and amalgamating ores, they have no equal. No effort has been, or will be spared to have them constructed in the most perfect manner and of the great number now in operation, not one has ever required repairs. The constant and increasing demand for them is sufficient evidence of their merita.

They are constructed so as to apply steam directly into the pulp, or with steam bottoms, as desired.

This Amalgamator Operates as Follows:

The pan being filled, the motion of the muller forces the pulp to the center, where it is drawn down through the apperture and between the grinding surfaces.—Thence it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, and to the circumference as before. Thus it is constantly passing a regular flow between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powder, and the metal amalgamated.

Setlers made on the same principle excel all others They bring the pulp so constantly and perfectly in contact with quicksilver, that the particles are rapidly and completely absorbed.

Mill-men are invited to examine these pans and setlers for themselves, at the office, 229 Fremont Street, San Francisco

Improved Cast and Forged

STEEL SHOES & DIES FOR QUARTZ MILLS.

[PATENTED MAY 26TH, 1874.]

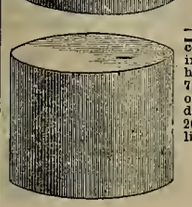
To Superintendents of Quartz Mills and Mining Men Generally.

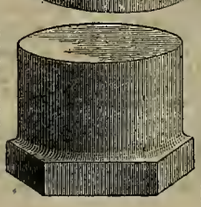
We guarantee these SHOES and DIES to do the work of four sets of iron and to be at least 10 per cent. cheaper. They are gradually coming into use in all of the principal mills on this coast.

Their advantages over iron are cheapness on first cost, increased crushing capacity, time saved in changing and in setting tappets, increased value of amalgam by absence of iron dust and chippings, and a saving of 75 per cent. in freight. They possess a similar superiority that steel rails do over iron rails. It takes 40 days to fill orders from the manufactory East. Price 20 cents per pound shipped at San Francisco. Terms liberal.

Address all orders, with dimensions, to

CAST STEEL SHOE & DIE CO.,
Room 1, Academy Building, San Francisco.
1v29-3m





The Los Prietos Mining Company.

This mining company, under the energetic management of the superintendent, Mr. John F. Cassell, is making rapid progress toward establishing the necessary works to place their valuable mines in a producing condition. A large number of men are now at work in the immediate neighborhood of the mine, making brick of which to construct the reduction furnaces. Others are engaged in opening and grading a wagon road from the stage road near the San Marcos rancho, up the Santa Ynez valley, to the mines, so that there will soon be a good wagon road all the way from Santa Barbara, over which even a light buggy can go with safety. Besides the men making the brick and getting out stone for the furnaces, and those at work on the road from the mines to San Marcos, the force of experienced miners engaged in getting out ore has been increased, and arrangements are under way to add still further to their number, so as to advance more rapidly the development of the productive capacity of the mine. Over 40,000 feet of lumber are ready to be carried across the mountains, to be used in the construction of houses for the accommodation of the miners and furnaces, and for other purposes. Besides the lumber that is to be freighted to the mines, there are also about 150 tons of general freight ready for transportation, for which teams are now wanted. Altogether, besides the lumber, there will be nearly 400 tons of freight to be carried over the mountains to the mines within the next sixty days. Superintendent Cassell meets with considerable difficulty in securing the number and character of teams required, and may yet find it necessary to go to San Francisco, and purchase wagons and horses to get this large amount of freight over to the mines in a reasonable time.—*Santa Barbara Index.*

Sonoma County Quicksilver.

The Petaluma *Argus* says: By no means the least among the vast and varied resources of Sonoma county are her quicksilver mines. That they are to become a source of immense wealth to the county, and at no distant day give employment to thousands of persons, we are fully convinced. Enough has been done to show that they are among the richest and most extensive in the world, and as yet the work of development is in its infancy.

The region within which cinnabar has been found in paying quantities embraces many square miles, a portion being close to the railroad, and all the advantages which it affords, while other parts more remote have an abundance of the most essential elements—wood and water—for working the mines. We are informed by a gentleman who is well posted on the subject that under the most favorable conditions for working, ore which will yield one-half of one per cent. of quicksilver will pay handsomely. A 15-ton furnace will produce 150 pounds of metal per day, which at present prices is worth $225, while the cost of taking out and working the ore will not be more than two-thirds of that amount. It is believed that there are millions of tons of such ore in the county.

We have this week very encouraging reports from the quicksilver mines near Cloverdale, Work is going forward steadily on the Live Oak and Hercules claims, which are about two and one-half miles from the town. From the former a large amount of ore has been taken which is considered sufficiently rich to be worked profitably. If the developments continue as favorable as at present, a furnace will be erected within a few months.

From the mines near Guerneville and in the vicinity of Pine Flat District, we continually receive very favorable reports.

AN AUTOMATIC TIME INDICATOR.—The Terre Haute (Ind.) *Journal* gives the following account of an arrangement for recording the time of trains, a specimen of which is now in use on the Terre Haute & Indianapolis road: "In the caboose, attached to one side, is an iron box with a glass front, the key to which is kept by the officers of the line. There is a common clock in the box. A spiral thread is fastened upon one of the axles of the car which turns a wheel over the axle. This communicates its motion to a set of rods, which in turn move another small wheel under the edge of the car, and it again moves a small rod which projects upwards into the iron box and moves a pencil point slowly back and forth over a narrow sheet of paper wound upon a small drum, which is turned at constant speed by the clock-work. The paper is ruled in red lines into small sections, every fourth line the short way being dotted and representing a mile. The movement of the paper being uniform and that of the pencil being regulated by the axle, the diagonal lines traced by the pencil will show the rate of speed at which the train has moved. For instance, if the car has gone a mile in four minutes, the line will cross just four sections in going from one dotted line to the next. If the car is standing still, the pencil is at rest and draws a straight line on the paper. The stations being marked at the proper places on the paper, at the end of the trip the roll will show what rate of speed was made at every part of the road, and where and for how long stops were made."

ORE SHIPMENT.—At present about ninety-five car loads of ore per day are shipped over the Virginia and Truckee railroad to the various mills on the Carson river and at Silver city.

The Heart of the Comstock.

The Consolidated Virginia mining company, says the *Enterprise*, are beginning to open up and lay bare some of the secrets of the northern end of the great Comstock lode. Their location is proving a most fortunate one; yet, strange as it now appears, this same ground lay idle for years. It was then in the shape of several small claims, upon which work had ceased after the first excitement of the early days of Washoe. These claims were knocking about in the market and nobody was found to purchase them or even look at them. Upon all of them a considerable amount of work had been done at the surface and in a line with the Ophir and the croppings of the Gould and Curry. But little pay ore was found in any of the claims and the companies owning them became discouraged and discontinued their prospecting explorations. At that time the opinion very widely prevailed that where nothing of value was found on the surface nothing need be looked for below, and the owners of the set of small claims lying between the Ophir and the Gould and Curry sorrowfully came to the conclusion that by bad luck a barren portion of the great ledge had fallen to their share. Years ago, in these columns, long before there was any Consolidated Virginia company, we urged these small companies to unite and sink a large prospecting shaft on E street, just east of Piper's Opera House, but no attention was paid to the suggestion—at least not by the men who then owned the ground. All that we then predicted in regard to this piece of mining ground has now been verified. There was a fault, a slip, in the lead above and the whole weight of the deposit was thrown further to the east. Although we have spoken of the break in the lead as a fault or slide, it was really in places more of the nature of a "pinch," and this was what cut off the old Ophir deposit at a certain depth. Now they are reaching the great lode on a new and sound line, and being below the disturbing influences mentioned are finding a continuous body of ore. This body is now known to extend from the Gould and Curry through the Consolidated Virginia, California and Ophir to the Union Consolidated. It will yet be found in the Union Consolidated and probably beyond. The heart of this portion of the Comstock, in our opinion, lies to the eastward of the gas works, and probably almost directly under the point where General Thomas H. Williams some time since was engaged in boring with his diamond drill. We think he "smelt it" when he began boring there. The Consolidated Virginia company are on the upper edge of the great deposit lying under the basin in which are situated the eastern suburbs of the city, and are now beginning to reach some of the rich ore it contains. In the early days many of our miners were of the opinion that in the course of time a point in the lead would be reached where would be found almost solid silver. At the further depth of four or five hundred feet in their mine the Consolidated Virginia company may reach a point where their ore will lack but little of being solid silver. There appears to be lying far down in this portion of the lode a perfect mountain of silver ore. Specimens brought up from the drift running into the Consolidated from the 1,500-ft. level of the Gould and Curry are even now almost solid masses of silver. The reporter of the Gold Hill *News*, who visited this newly opened section of the Consolidated Virginia mine, gives the following account of it:

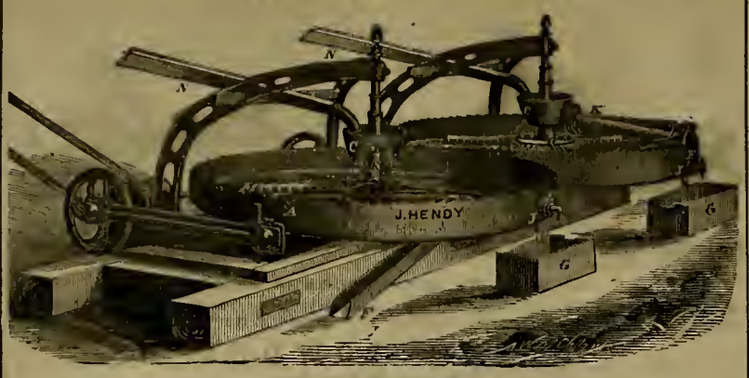
This drift, after reaching the Consolidated Virginia south line and being connected with the 1,500-foot level of that mine by an air winze, the Gould & Curry drift being 38 feet lower down than the south drift from the Consolidated Virginia shaft, was pushed directly ahead to prospect the ore vein on that level. Hardly had the line been crossed before the drift encountered a body of rich sulphuret ore, second to nothing of the kind now known to exist on the Comstock lode. The drift has penetrated this body of ore 110 feet, with every indication of its extending the entire length of the claim, and even into the California ground. To attempt a fair description of the rich character of the ore is almost useless, the sides and face of the drift being one glittering mass of sulphurets mixed with the richest character of chlorides. Much of this ore is being sacked, and a portion of the amalgamating department of the Mariposa mill is to be set apart for its reduction, its extreme richness often requiring the use of 500 and 600 pounds of quicksilver to a charge for a single pan, where only 200 pounds is used in working the ordinary class of ores. No cross-cutting of this body has yet been attempted, as all the air forced in by the compressor is required to drive the Burleigh drills in the face of the drift. The exhibition of the precious metals displayed in the face when a blast of half a dozen holes is discharged is simply grand, and one that would cause the eyes of a miser to weep with joy. Two upraises have been made, 100 feet apart, for air connections with the 1,500 foot drift south of the shaft, both of which passed the entire distance through the same rich character of ore. The future prospects of the Consolidated Virginia, judged by its present developments, are not only almost without an estimate, but every drift run, in fact almost every stroke of the pick made, seems to be adding to its already immense wealth.

During the month of August Melbourne, Sydney and Adelaide exported 950 tons of copper and 2,000 tons of copper ore.

OVER $3,500 PER MONTH SAVED

BY THE USE OF

Hendy's Improved Amalgamator and Concentrator



Can be seen at the Manufactory, No. 32 Fremont Street, San Francisco.

SAN FRANCISCO, April 27, 1872.

JOSHUA HENDY, Esq.—*Dear Sir:*—As a practical miner and millman, I take pleasure in recommending the use of your Concentrators in all mills where gold or silver ores are reduced. No mills should be without them, for the following reasons:

1st. They are good sizers (no perfect concentration in pulverized ores can be effected without first sizing).

2d. The best Concentrator I have ever known—(the concentrated stuff only containing 5 per cent. of sand).

3d. They are good amalgamators, light (feathery) particles of amalgam and particles of coated gold by attrition are brightened, and from their specific gravity and the action of the pan, fall to the bottom and adhere.

4th. They require but little power and attention to run them, and with ordinary care will last for years.

I have been familiar with the workings of your Concentrators for four years past; have run them myself in the North Star Mine, Grass Valley; am familiar with their practical workings on the Empire Mine, Grass Valley; St. Patrick, Placer Co.; St. Lawrence, El Dorado Co.; Oaks and Reese, Mariposa Co., and most cheerfully give you this testimonial. For further information you are at liberty to refer to,

Yours respectfully,

JAS. H. CROSSMAN, M. E.

409 California street, or Cosmopolitan Hotel.

SAN FRANCISCO, February 10, 1874.

Office Superintendent of Keystone Con. M. Co., Amador, Amador County.

MR. J. HENDY—*Dear Sir:*—In answer to your inquiries as to your Concentrators furnished our company last July, I would say that I am more than pleased with them; and the saving to the company has been over $3,500 per month more than with the blankets and huddles formerly in use.

O. C. HEWITT, Supt.

OFFICE SUMNER MINE, Kernville, April 27, 1874.

J. HENDY, Esq.—*Dear Sir:* Having four of your Concentrators in use at our Mills for four or five months, which for saving Amalgam and for concentrating Sulphurets, are a success, beyond a doubt, I feel it a duty due you and those interested in Quartz Mills, to recommend them.

As further evidence of their worth, I now order TWELVE more of your Machines for our new Mill, now in course of erection.

E. R. BURKE, Superintendent.

Scientific and Practical Books on Mining, Metallurgy, Etc.

Published or issued, wholesale and Retail, by DEWEY CO., MINING AND SCIENTIFIC PRESS Office, S. F.

BY GUIDO KUSTEL,
MINING ENGINEER AND METALLURGIST.

Roasting of Gold and Silver Ores, and the Extraction of their Respective Metals without Quick silver. 1870.

This rare book on the treatment of gold and silver ores without quicksilver, is liberally illustrated and crammed full of facts. It gives short and concise descriptions of various processes and apparatus employed in this country and in Europe, and explains the why and wherefore.

It contains 142 pages, embracing illustrations of furnaces, implements and working apparatus.

It is a work of great merit, by an author whose reputation is unsurpassed in his speciality.

Price $2.50 coin, or $3 currency, postage free

Concentration of Ores (of all kinds), including the Chlorination Process for Gold-bearing Sulphurets, Arseniurets, and Gold and Silver Ores generally, with 120 Lithographic Diagrams. 1867.

This work is unequaled by any other published, embracing the subjects treated. Its authority is highly esteemed and regarded by its readers; containing, as it does, much essential information to the Miner, Mill man, Metallurgist, and other professional workers in ores and minerals, which cannot be found elsewhere in print. It also abounds throughout with facts and instructions rendered valuable by being clearly rendered together and in simple order. It contains 120 diagrams, illustrating machinery, etc., which alone are of the greatest value. PRICE REDUCED TO $5.

Nevada and California Processes of Silver and Gold Extraction, for general use, and especially for the Mining Public of California and Nevada, with full explanations and directions for all metallurgical operations connected with silver and gold from a preliminary examination of the ore to the final casting of the ingot. Also, a description of the general metallurgy of silver ores. 1864.

As its title indicates, this work gives a wide range of information, applicable to all vein miners and workers in precious metals, affording hints and assistance of exceeding value to both the moderately informed and the most expert operator.

Price, $5 in cloth, $6 in leather—coin.

BY OTHER AUTHORS.

The Quartz Operator's Hand-Book; by P. M. Randall. 1871. Revised and Enlarged Edition. Cloth bound, 175 pages. Price, $2.

Sulphurets: What They Are, How Concentrated, How Assayed, and How Worked; with a Chapter on the Blow-Pipe Assay of Minerals. By Wm. M. Barstow, M. D.; 1867; cloth bound, 114 pages. Printed and sold by DEWEY & Co. Price, $1; postage free. The best written work, and most complete work on the subject treated.

ANY OTHER BOOKS DESIRED will be furnished at the most reasonable rates by DEWEY & Co., Mining and Scientific Press Office, S. F.

IMPORTANT MEDICAL CORRESPONDENCE.—If all who are suffering from Coughs and Colds and other throat and lung diseases, could read the letters continually received from all the country, giving the details of cases similar to their own that have been cured by *Hale's Honey of Horehound and Tar*, the demand for that life-saving specific, vast as it is, would be doubled. It never fails. No cough can resist its tranquilizing influence. It strengthens weak lungs and prevents the possibility of tubercular consumption.

Pike's Tooth Ache Drops—Cure in one minute.

Office—Corner Fourth and Townsend streets, San Francisco. 16v7-eow-hp-3m

Cazin's Combination Ore-Sizer and Concentrator—One Plunger System.
[Covered by Letters Patent of July 2d, 1872, and recent applications.]
Containing a sizing apparatus, (revolving screen) delivering two or four sizes of ore to two or four rows of sieves, each row independent of the other, and each having 5 sieves, each row concentrating according to specific gravity the special size automatically fed unto it, resulting in the simultaneous continual delivery of separated materials, working 2d and 3d-class ores into 1st-class ores of perfect cleanness. It thoroughly separates native gold or copper from quartz or any other lode matters—galena and silver sulphurets from pyrites, baryta and quartz; and pyrites from quartz.
Added to a battery of stamps these machines constitute a full system of ore concentration, sufficient in most cases for the requirements of western mines, with a capacity of 15 or 20 tons per 24 hours.
For particulars apply to,

SAN FRANCISCO, SATURDAY, NOVEMBER 14, 1874.

VOLUME XXIX Number 20.

Measurement and Yield of Gravel.

Mr. W. A. Skidmore, in his report to the U. S. Miniag Commissioner, on the Bald Moantain claima, extracts from whioh are given in another oolumn, makes some remarks on the measurement of gravel in mines which are interesting and which he allows us to puhlish. He says: The method of stating the yield of gravel varies in different localities. In some counties in California the standard is the "oarload," generally 16 cobic feet or a ton; but as there is no regulation size of car, and its dimensions and capacity depond on the size of the tunnel, this affords no atandard of comparison. Again the yield is sometimes expressed as so much to the superficial yard of channel ground; hut here we meet with the difficulty that the hight of ground worked is not uniform, heing in some places three feet, and at others four and five feet. The only unvarying standard of comparison is the cubic yard; but unfortunately, thia ia not in general use among miners, and necessarily our means of comparison are limited. It is, however, well understood that gravel should pay from 50 cents to $1 per carload of 16 cubic feet to he considered as profitahle for drifting. We may therefore fix the minimum yield at from 85 cents to $1 per cubio yard of hroken ground.

It will he observed that a distinction ahould be made hetween gravel in place and gravel broken down to the condition of loose dirt. It is apparent that a cubic yard of ground as it atands in its position in the mine, where it is so compressed as to require the nse of drills and gunpowder for its extraction, cannot he contained in its loose or hrokeu condition within the limits of a car or hox of the dimensions of one cubic yard. Careful observation and comparison have demonstrated that in a majority of cases a cnhio yard of standing ground will, when broken down, fill two cars of the capacity of one cubio yard each. The measurement of the ground worked in the Bald Mountain company's claim, compared with the number of carloads extracted, confirms this statement.

Orr'a Safety Nozzle.—The Fire and Water committee of the Board of Sopervisors, of this city, have reported in favor of using Orr's Patent Safety Nozzle. The committee recommends the purchase of ten sets for the use of the Fire Department. The advantage of this patent is that there is a valve, or overflow pipe, attached to the engiue, through which the waste water runs, and that the pipe mao, eveu if on the upper story of a hotel, can turn off the water with this patent nozzle, without iujuring the hose, hecause the wa ter flows as waste from the patent overflow valve, as it may he termed, attached to the engine. By this contrivance a hose can be taken through a huildiog dry until the fire is reached, which must very much lessen the damage hy water.

Arrangements are heing made hy the Virginia and Gold Hill water company for snpplying the town of Silver City with pure water from the Sierras.

An immense hed of gypsum has heen found in Rye valley, Baker county, Oregon.

Damages by a Typhoon.

Details of the terrihle typhoon which occurred at Hongkong, China, and vicinity on September 22d, have arrived hy mail. It is scarcely possihle to conceive how suoh havoc could he created hy the winds and waves. It is known that over 8,000 lives were lost, and at Hongkong property valued at $5,000,000 wss destroyed. Vessels were wrecked, wharves torn away, houses unroofed and haildings blown down. A very high tide increased the danger and damage. An eye witness at Hongkong says:

"I had heen out dining with a friend and started to return home a little after eleven. It was then hlowing very hard, but neither I nor any of my companions had an idea of the severity to which the gale was destined to reach. I accordingly went with a compaaion to the Praya to see the sight, and certainly never witnessed anything so striking in my life. Although I have seen many typhoons during a stay of over fourteen years in Hongkong, I do not know of any which has caused so much injury to the Colony and so much loss of life. By the time we had arrived at the Praya the wind had freshened rapidly, and the typhoon was raging with full vigor. The sea was breaking over the Praya with terrific force, while the roar of the wind was deafening. The sea hroke bright with phosphorescent light and presented a striking and awful sight. The lights on shore flickered through the darkness and seemed oaly to render it the more iutense. Gradnally the swell increased, and the waves rushed quite acrosa the Praya, and I had to push my way knee-deep in the water. Clinging to such projections from the houses as were within my reach I endeavored to continue on my course, but soon found that it was too dangerous to persevere, as the waves were coming in with such force that there was every chance of heing washed away, while tiles aod hricks were falling in all directions from the shaken houses. It was 1 o'clock when I was thus forced to heat a retreat, and I may mention that up to that time none of the sad casualities which have been recorded had occurred; and as the gale began to moderate at 3 o'clock, it is evident that the havoc must have heen the work of little more than two hoars."

To convey an adequate idea in general worda of the effeot that this tremendous gale has produced, is impossihle. From the accounts given of the extraordinary high tide, it would almost seem that there must at one time have heen a tidal wave, and this would fit in with statements made in some quarters with reference to the stoppage of clocks, which seemed to indicate that a slight shock of an earthquake occurred while the typhoon was raging. Every ship in the port of Hongkong was damaged. The fine steamer Alaska, helonging to the Pacifio Mail Company, was hlown ashore at Aherdeen, as were a number of other ships and steamers, and junks and sampans innumerahle. As showing the force of the galo, it may be interesting to note that the smallest twigs were hroken off almost as sharply as if cut hy a knife. At Aherdeen, Stone-cutters' Island, Kowloong, Swatow and Macao immense damage was done. At Macao the typhoon and fires nearly leveled the entire city, and the loss of life was enormous. At Swatow the sea ran so high as to flood the Custom House, whioh is three hundred yards ialand, to such an extent as to damage the whole of the papers in the office. Serious injury has also been sustained io otber directions. As to vessels outside of course nothing is known and more details of damage will prohahly come to hand. One of the saddest considerations is that nnmherless junks hava utterly gone to atoms with every soul on board, so that hundreds of people must he kept in lengthened suspense as to the fate of friends and relatives, of which no one lives to tell the tale.

The total loss of life is not known as yet, as hundreds of bodies were seen floating out to sea. A correspondent writes that four days after the gale, in Macao, the effluvium arising from the thousands of decomposing bodies was so great that the National Guards revolted and refused to bury any more; and the Governor, fearing that a plague would soon follow if the bodies were not disposed of, ordered them to he hurned. Four thousand were cremated, first covering them with tar and then settiog fire to them.

Want of space forhids our giving further details of this appalling disaster, beside which earthquakes and ordinary gales seem trivial. A great number of Europeans, as well as Chinese, were killed. Business was about entirely suspended for many days, and everybody is bnsy repairing damages to dwellings, etc. This typhoon has caased more damage to life and property than any one catastrophe of similar character of whioh we have recollection.

Four men working on the 1,000-foot level of the Belcher mine were asphyxiated on Tuesday morning by inhaling had air. Dr. Manson, who attended them, reports them out of danger.

Placer Mining.

The scene depicted on this page will hriag to the minds of many of our readers recollectioas of the early days of mining ia California when gold was easier to get at than at present. Claims were smaller, wages larger, gold more plentiful and times easier to the workiag miner thau now, when capital makes more out of mining than lahor. We see in the engraving a miaer panning out some dust for a prospect; another woking his rocker; others at the "long tom," and still others washing in sluices. Some of the miners are "drifting" into the hill, some working a shaft to hed rock and some working in an open cut and pitching the gravel into the "tom."

PLACER MINING.

Most of the diggiags of this class are now worked out in California or are now being reworked for the third or fourth time hy Chinamen, who earn from $1 to $2.50 per day in snch ground. The gravel mines are now worked on a large scale, with tremendous heads of water, heavy expenses and by wealthy companies. The area of ground now owned hy these oompanies would, in early times in Califoroia, have been large enoagh for 500 or 1,000 men to work on; but then of course it is a different class of ground and not near so rich as that worked byindivldnal miners. The processes in mining shown in the engraving are so well known, that it is useless for us to go into details and describe them.

Biggest Work on Record.—Duriog the month of October, says the Virginia *Independent*, the workmen in the Sntro Tunnel have been snccessful in pushing it forward. Dnring the week endiug October 8th, 83 feet of 10x14 tuunel were made; October 15th, 80 feet; Octoher 22d, 81 feet. From October 22d to November 1st, 116 feet, makiug a total of 360 feet in a single month. This is not only the largest result yet accomplished, but the greatest month's work on record in the history of tunnel-making. The whole length of tunnel now oompleted is 7,792 feet. A veio of water has beeu struck and yesterday it was some three inches deep in the tunnel. It is, however, fast flowing out and the vein will soon be exhausted. This work speaks well for the Burleigh Drill whioh is used in the Sntro Tunnel.

A letter from Panamint says the five-stamp mill is nearly ready to commence work. Another mill is going up under the management of Messrs. Jones and Stewart, who have a large force of men engaged in mining, grading, road-cutting, etc.

The furnace erected at Cerbat, Arizona, two years ago, which was at first a failnre, has become a success under the management of Col. Buell and Mr. Fisher. The first bullion turned out is now waiting shipment to this city.

It is exactly 169 miles by roadometer measurement from the town of San Bernardino to Panamint.

A large number of persons are passing through Los Angeles on their way to Panamint.

The Wallapai Mines.

The *Post* has been furnished with some facts concerning these mines, by Silas Atchinson, who has recently returned from these mines. We condense as follows: These mines are situated near the Colorado river in Mohave county, Arizona Territory, and are about 170 miles in an air line northeast of San Bernardino city. This district is undoubtedly in the same argentiferous mining belt as the Comstock, the Panamint and other mines are located.

The Routes.

There are two ways of reaching this mining district. One by ocean steamers to the Gulf of California, thence by the boats that run up the Colorado to Hardyville, which is about thirty miles from Cerbat, the principal town in Wallapai district. This route is not much traveled by passengers, being tedious, but is the usual line over which merchandise is transported from and ore shipped to San Francisco and thence to Swansea to be smelted.

The other route is by way of San Bernardino, and thence by wagon or saddle. Animals suitable for the trip can be bought quite cheaply in San Bernardino, and are always useful in the mines. The stopping places upon the route are numerous, and the journey need not be an irksome or dangerous one. From San Bernardino by the way of Tejon Pass, to Lewis' Station, is 23 miles; the next station, on the Mohave river, is 18 miles; to Fish Pond, where the road forks, 14 miles; to Cady, 9 miles; to the Caves, 16 miles; to Soda Lake, 22 miles; thence to Morrill Springs, 35 miles; to Rock Springs, 22 miles; to Piute Hills, 18 miles; and to Hardyville, 23 miles. As already stated, this point is on the Colorado river, 30 miles from

Cerbat.

This is the largest camp in the district. It now contains about 250 persons. There are several families living at this place and they have a small school of twelve to fifteen scholars. There are here two stores, three or four saloons, two blacksmith shops, one livery and feed stable, and the other conveniences of a mining camp. It is the county seat of Mohave county. At this place Buel & Fisher have a

Smelting Furnace,

With a capacity of six or eight tons per day. It is constructed in the crudest manner, and therefore does not produce large results. It gives employment to seven or eight men, and though it has not come up to the anticipations of the miners or owners, it has done as well as could be expected under all the circumstances.

Smelting Ores

Are abundant within a distance of three miles, and some as near as a half a mile from the furnace, much of which yields in this imperfect structure from $30 to $200 a ton. There are a number of fine lodes of rich ore in this neighborhood, generally galena, and yielding from 30 to 50 per cent. of lead. From the district there has been shipped to San Francisco and to Swansea, Great Britain, some ore of great richness. Charcoal is used for smelting, and can be had at about 30 to 35 cents per bushel. Wood is worth six dollars per cord. To illustrate the value of the ore I may state that a gentleman, an owner in the Indian Bay mine, offered to deliver ore to the Buel furnace, and take for his pay for mining and hauling all over $75 per ton, also giving the lead to the furnace owners, which would yield them from 40 to 45 per cent. He would have to haul the ore two and a half miles. His offer is still open, and he says he would then make $50 a ton.

Mineral Park

Is situated about five miles in a northwest direction from Cerbat. It is a smaller place than Cerbat, but has two stores, two restaurants, one blacksmith shop, and the usual number of saloons. This place boasts of a five-stamp mill. It is now under the management of Captain Wilburn. There is connected with this mill and in successful operation a Crowe concentrator. After the ore is crushed it is put through the concentrator and the bulk is reduced from eight tons to one. It is then carried to Buel's furnace and smelted, saving a large expense in handling, hanling and smelting.

The altitude of Wallapai district is between 2,500 to 3,000 feet above the level of the ocean, affording a most delightful climate. During the last summer the thermometer did not rise above 96 degrees in the shade, nor fall below freezing point in the winter, except on two or three occasions. The winters are simply delightful.

The soil of Sacramento and Wallapai valleys is a sandy loam, producing a good growth of grass, and when watered, a very luxuriant crop. These valleys are from ten to fifteen miles wide, north and south, and many miles in length. There is always plenty of food for stock. All working animals feed on live grass

Mountains, Roads and Wood.

The mountains are neither so high, so steep nor so rugged as in California, and therefore prospecting is more easily accomplished. Persons can travel over nearly all these mountains on horse or mule back. Roads are more easily constructed in this mining district than in the mines of California. There are already some very good roads in the Wallapai district, and the road from San Bernardino to Hardyville is excellent, except in the Thirty-mile desert.

Wood can be had in great quantities from a growing forest about 14 miles from Cerbat, ten miles from Mineral Park, and within a mile or two of Chloride. In addition to this, the tributaries to the Colorado—that is, the Grand, the Green and San Juan rivers, rising in the forests of the Rocky mountains—carry great quantities of pine, spruce and fir timber, brought by snow and land slides into these mountain streams. The waters from the melting snows of June and July carry it into the Colorado, which bears it toward the ocean. By hooming and other means most of the drift, amounting to thousands of cords of lumber, can be saved each year for the use of the district in timbering, making charcoal and for building.

The Indians

In this section have been bad, and have murdered several persons, but they are now peaceable. There is no danger from them, I believe, if treated right. Your informant often camps alone with them feeling perfectly safe.

The area of the mining region extends north and south perhaps hundreds of miles, and is from four to ten miles wide. Very many mines are yet undiscovered. It is a great opening for prospectors. The poor man has yet a chance of becoming rich. A want of capital to erect mills and furnaces, and a fear of the Indians, has kept the district back; but it must soon come to the front, and population and money will flock to Wallapai.

Calaveras County Mines.

The Calaveras *Chronicle* says: Mining operations in this vicinity present an encouraging aspect. Never before has there been such a systematic, energetic prosecution of extensive gravel mining as is carried on at present. The invaluable inventions for facilitating operations have enabled the miner to attack gigantic gravel banks which heretofore defied his efforts. In fact a complete revolution has taken place in the methods of gravel mining. The wonderful power of water has been brought to act with astonishing effect through the means of modern inventions. The numerous gravel hills, rich in auriferous matter, but presenting obstacles that could not be overcome in early days, for want of proper means, are now being worked with perfect ease and remarkable results. The mines in this section have fully established their reputation as valuable property, and continue yielding handsomely. It is amusing to reflect how, a few years since, the very hills, now such valuable property under the present system of working, were considered exhausted diggings. There are thousands of such remaining, awaiting the practical and enterprising miner to yield their wealth. Modern mining appliances have marked the commencement of a new era in this interest, which reveals a wealth in the hills far exceeding former must prove eminently satisfactory. The hoisting works are located nearly a quarter of a mile from the mill. The incline is down upwards of 200 feet. The bottom end is in 118 feet from the incline, and is being run to connect with a tunnel through which all ore from the southern portion of the mine will be run to the mill. As soon as the connection is made the ore will be carried underground direct to the mill, whereas at present it is hauled by teams at considerable expense. Some twenty men are now engaged in taking out "tribute rock." They drive drifts when necessary and receive a small price per foot in money, and a portion of the ore extracted. They take out ore in out-of-the-way places, where it would be unprofitable for the company to do it by the day. In most instances the men will make good wages. An experienced force of men are to be put on, sufficient to take out enough to keep the sixteen stamps running to their full capacity. Altogether, the Wyoming is in a healthy condition.

COPPER ORES.—Mr. F. Zwickl, of Jersey City, says that his process for treating copper ores is an improved one, and one by which argentiferous, auriferous, or other copper ores may be treated either independently or as an auxiliary to other processes for the extraction of gold, silver and copper. It consists of a combination of operations, namely, smelting of the ores in a reverberatory furnace to a mat, with admixture of sulphate of soda, for the purpose of disintegration; oxidation of the disintegrated mat in a furnace similar to that of a common roast furnace, suitably adapted to prevent the heat from rising above the desired degree; repetition of this oxidation after the first is finished, and the product of it has been soaked with water, dissolving the sulphate of copper formed during the said oxidation in a tank with water, and after removal of the solution, dissolving the copper still left in residue with a solution of sulphate of iron, this latter process being repeated as long as any copper is left in the residue, and the copper in solution to be precipitated with iron. The residue containing peroxide of iron and all the gold and silver, being much reduced in bulk, can be treated by any known method for the extraction of the gold and silver, or used as a flux for smelting the ores, and to accumulate the bullion as far as desired.

HOISTING WORKS IMPROVEMENTS.—The steam from the engines in the different hoisting works hereabouts condenses rapidly during the cold weather, and settles upon the machinery and wood work in large drops of water, causing the one to rust badly and the other to decay rapidly. To obviate this trouble the Yellow Jacket mining company, in making their recent improvements, constructed an open cupola over their works, which is very serviceable in allowing the steam to escape through the top of the building.—*Gold Hill News.*

Wyoming Mine.

In a previous issue, says the Grass Valley *Union*, we gave a short item relating to the completion of the Wyoming company's new mill. Since then we visited this and other mines in the vicinity and are able to give the following particulars: Although we were aware that improvements were being made at the mine, we little expected to see the very complete structure the company have erected for reducing their ore and saving the gold. Through the kindness of the superintendent, Mr. Charles Purinton, we were shown around the mill and by repeated questions and observations we obtained the following items of interest. Heretofore the rock taken out of the mine depended upon a six-stamp battery for crushing. As the ledge is large and ore can be easily raised, the mill did not afford sufficient capacity and it was decided to enlarge and reconstruct the same. Accordingly a ten-stamp battery was erected in line with the two three stamp batteries heretofore in use, thus giving a 16-stamp mill.

So far as we were able to judge, the mill as now constructed and arranged is one of the most convenient and perfect ones we remember to have seen. In front of each mortar is a square copper apron the width of the mortar and four feet in length, from which aprons copper sluices 14 feet long and 16 feet wide extend. Where the copper sluices terminate, revolving blanket sluices 12 feet long and 18 inches wide take the tailings. After passing off these blankets, the tailings are carried through boxes to a system of concentrators, which are operated by pulleys and ratchet wheels, and in these concentrators the sulphurets run in, while the lighter sand is carried off by the water. It is the intention of the superintendent to put in pans to grind the blanket-washings, which he informs us will pay at least $30 per ton. The recent rain prevented the completion previous to our visit, but in a few days the pans will be in operation. The power in use is water, applied to a "hurdy-gurdy" wheel 16 feet in diameter, and the overshot wheel in previous use to run the six-stamp mill. These wheels are so arranged as to "pull together," that is, the water after passing from the hurdy wheel is carried to the overshot wheel and this, with what water may be obtained from the creek will furnish power nearly all the year to run six stamps and some portions of the year ten.

The water to run the hurdy is obtained from the South Yuba Canal Company's ditch, a small ditch having been dug to convey the water to the top of the hill above the mill, where it runs into an eleven-inch pipe, and thence is conveyed to the wheel at the mill. The pipe is upwards of 700 feet in length, and the pressure obtained is 270 feet vertical, yet one would perish with thirst if dependent upon the water leaking from it. The pressure is sufficient with 50 inches of water to run the stamps 60 drops a minute. Arrangements are made to connect a three-inch hose to the main pipe for use in case of fire, and the pressure is sufficient to reach any part of the mill, and a fire can be as quickly and effectually quenched by this hose as could one by the water works of this city. As we remarked before, the mill is very complete; and judging from the healthy appearance of the copper plates and ore room, we feel confident the owners were justified in making the outlay they have, as the receipts calculations.

The quartz interest, yet in its incipiency, promises a grand development in the future. Judging from the persistency with which work is carried on, confidence in the ultimate success of the various enterprises is a settled thing in the minds of miners. More extended researches are daily planned and undertaken, and daily developements favor their prosecution. In reality, mining has only commenced, such as will be a permanent source of wealth to the country. The gold taken out is but a trifle compared with the riches yet locked within the hills. From the present outlook of things we cannot but predict more prosperous times in the future. Evidences are tending to a realization of present anticipations, and the resurrection of "lively times" we safely hope to chronicle.

A NEW THEORY OF ELECTRICITY.—Professor Edlund, a Swedish physicist, expounds in a recent work a new theory of electricity, the substance of which is as follows: He supposes the existence of a highly subtle and elastic ether, everywhere present, both in *vacuo* and in ponderable matter. Two molecules of this ether are mutually repelled along the line of their connection, and in inverse ratio to the squares of the distances. In good conductors the molecules are displaced easily from point to point, it being presumed that they can be moved with little force. If the body be a non-conductor, this mobility is arrested, and depends on the molecules of the material body. A molecule is at rest from the moment when it is equally repelled on all sides. If the repulsion be less at one side than at the other, the body will move if it be free in the direction of the resulting forces.

NEW MINING ENTERPRISE.—G. F. Kellogg, formerly head foreman of the Crown Point mine, has leased 300 feet of ground from the Yellow Jacket mining company on their north line, adjoining that of the Confidence. Mr. Kellogg has cleaned out the old Michigan shaft and put it in working order. He has also had a donkey engine set up at the shaft, and will soon commence to take out ore.

Tybo District.

We extract the following facts concerning this district from a letter in the Eureka *Sentinel:*

The principal mine is the 2 G, consisting of three tunnels, running in a southeasterly direction, one above the other, and designated as tunnels No. 1, 2 and 3.

Tunnel No. 1 has a length of 340 feet. Two hundred feet of this distance contains lead and smelting ore, the remainder quartz and milling rock. Two shafts, or winzes, have been sunk in this tunnel to a depth of 75 feet each, one at a distance of 110 feet, the other 240 feet from the month of the tunnel. From the bottom of these shafts tunnels are being driven toward each other, and the quality of ore being found is the best yet discovered in this district.

Along the main tunnels are reserves opened so that in case the supply of ore gives out in the winzes, or by any cause be partially checked, ore can be immediately obtained. Owing to the fact that the company has no means of working quartz, this portion of the ore body is only mined to a sufficient extent to allow a passage way through. This passage demonstrates that the quartz ledge is at least seven feet wide, but the entire width has not yet been ascertained.

Tunnel No. 2 is 384 feet in length and 43 feet above the level of No. 1. It strikes the different chimneys in the same manner as in the lower tunnel. These two tunnels are connected by a shaft through which all the ore passes that is extracted above No. 1. All the ore coming from below the level of this tunnel is brought up the main shaft, sunk about 200 feet from the tunnels.

Tunnel No. 3 is still higher, and is now in a distance of 70 feet, developing the same kind of ore as found in the other tunnels.

The furnace that has been shut down for want of coal has

Resumed Work

And is turning out bullion at the rate of three and a half tons a day. The value of this bullion is about $400 to the ton, which shows the character of the ore being taken out of the mines of our district. The furnace employs fifteen men, and is the only one running; but the capacity of the engine, blower, etc., is such that another furnace can be added without loss of time. It is the intention of the company to erect another furnace soon. In connection with the furnace are the usual accessories: rock crusher and mills for grinding. A roaster is in operation and a refinery fast approaching completion. The method of conveying the ore from the mine to the furnace is exceedingly convenient, being by means of cars running on a track. Lime rock is used as flux and is easily obtained, being quarried near the track. The Tybo Consolidated company has purchased

The Highland Mill,

In Highland district, near Pioche, twenty stamps, which will be immediately torn down, removed here, rebuilt, and the crushing of milling ores commenced. The wood and coal trade is quite an item here. About 75 men are at work in the woods felling timber, burning coal and cording firewood. The water supply is sufficient for all purposes, both for the works and for town use.

Besides the 2 G mine, the Tybo Cons. own the Lafayette, Casket, Hunkadori and other locations, all on the same ledge, which can be traced for three miles.

All the features of the place indicate not only a prosperous camp for the present, but also one where prosperity is lasting. All the crude substances, ore, wood and water, are found in abundance; we have close communication with Eureka and Belmont, and willing hearts and eager hands are here to make our district occupy a prominent place in Nevada's mining camps.

A NEW FOSSIL MAMMOTH.—The bones of a huge animal have been discovered on the farm of Orman Tuttle, in Seneca township, Lenawee county. These bones were discovered ten feet below the surface, and a tusk taken out is eight feet long and weighs 150 pounds. The ribs are of immense size, the shortest being over six feet long. One of the thigh bones has been taken out, and it is estimated that the hight of the animal must have been 20 feet, and its length 30 feet. Its teeth are larger than a man's two fists, and a foot in length. What sort of animal this huge monster must have been remains for the comparative anatomist to determine.

TO RESTORE BURNT PICK POINTS.—A correspondent to the *Scientific Manufacturer* says, "To restore the burnt steel point of a pick, drill, or any similar tool, do not touch it with a hammer, but while it still emits sparks plunge it into cold water and let it remain there until cold. Then reheat to the proper degree and work it. It will then be found as good as before it was burnt."

MECHANICAL PUDDLING.—This subject is still largely engaging the attention of the iron masters of England. It has been freely discussed at several meetings of the Iron and Steel Institute. Thus far the Danks process is the one selected as most likely to meet all the contingencies in the case.

RECENT EXPERIMENTS by M. Sorel prove that carbon retains its reflecting capacity even at the highest temperatures. A sunbeam becomes reflected by diffusion, and is polarized in exactly the same manner, whether it falls upon a brilliant flame or upon earth.

MECHANICAL PROGRESS.

Tempering Steel.

Tempering is the romance of the smith's shop; it has an attraction about it that characterizes every process that is mysterious, especially any process connected with, or belonging to mechanical manipulation. A strange and perhaps fortunate habit of mind is to be greatly interested in what is not understood, and to disregard what is capable of plain demonstration.

An old smith who has stood at the forge for a score of years, will take almost the same interest in tempering processes that a novice will. Give an old smith a piece to temper that is liable to spring or break when the risk is great, and he will enter upon it with the same zeal and interest that he would have done when learning his trade.

No one has been able to explain why a sudden change of temperature hardens steel, nor why it assumes various shades of color at different degrees of hardness; even the most critical researches into the chemistry of steel have offered no rational explanation. We only know the fact, and that fortunately steel has such properties. Every one that uses tools should understand tempering them, whether it be for iron or wood work. Experiment with tempered tools is the only means of determining the proper degree of hardness, and as smiths except with their own tools have to rely upon the explanations of others as to proper hardening, it follows that tempering is generally a source of complaint with those who use tools hardened by others.—*Jour. Franklin Institute.*

WOOD-SAWING BY WHITE HOT WIRE.—We mentioned, some months ago, that a person in New York had invented and patented a process for sawing wood by a wire kept white hot by electricity. The matter seems recently to have attracted the attention of the Abbe Moigno, editor of *Les Mondes*, who speaks of the invention as follows: The wire receives the same reciprocating motion, which is commonly given to the saw, and thus burns its way through the wood. It is practicable, according to the inventor, not only to cut logs into planks or heavier forms of lumber by this means, but also to give curvature to the cut, and to produce fantastic forms of every description, since the saw, being without breadth, adapts itself to such purposes better even than the hand or ribbon saws. Inasmuch as the wire burns its way instead of cutting, it leaves the surface of the wood charred; but this is an effect entirely superficial, and occasions no injury to the material. It would seem as if, however, there were an important question of economy here to be settled, and we shall wait before pronouncing an opinion on this application of science until we hear from it further.

TRANSFORMATION OF SANDSTONE TO MARBLE. J. Corvin, an engineer residing at Dresden, Germany, has invented a method of giving the ordinary sandstone, found in abundance in many localities, the exterior appearance of marble. He accomplishes this by impregnating the well dried stone with soluble silica and alumina. The sandstone thus prepared becomes much lighter in color, some kinds being intensely light and translucent, while it is capable of the highest polish, equal to that on the purest marble. He has even succeeded in imitating marbles of every color by adding mineral colors to the liquid used for impregnation. The famous quarries near Pirna, in Saxony, produce a sandstone especially adapted to this process, and Mr. Corvin now makes colored stones from this sandstone, adapted to the most elegant architectural structures. The price is considerably below that of marble, and the new material has the important advantage that it is much more fire-proof than marble, which, when exposed to the fire, rapidly burns into quicklime and crumbles to dust.

STEEL ARMOR FOR LAND FORTIFICATIONS. The Gruson foundry at Magdeburg have manufactured a full complement of the newly invented cast-steel blocks for the protection of the fortifications at the mouth of the Elbe and Weser. These blocks are from fifty to seventy centimeters thick, and when placed on the scarp of properly constructed earthworks render the latter absolutely invulnerable. The new cuirassed works will be armed with the twenty-eight centimeter cannon, hurling a projectile of three cwt., and firing five rounds every quarter of an hour. Besides these earthworks cuirassed revolving towers, which are likewise ready, and admit of being armed with the same ordnance, will be placed at some points of the shore.

STEEL VS. IRON PLATES.—Herr Krupp, after many previous experiments in the same line, has turned out cast steel plates supposed to be equal to the strongest iron plates manufactured in England. As soon as the new 30½-centimetre cannon is ready, the solidity of the novel plates will be tested by the novel gun.

GATLING GUNS FOR SEA SERVICE.—In consequence of the satisfactory results of the trials made with one of the cutters of the Monarch, which has been fitted to carry one of the Gatling guns, an order has been received at Chatham directing that all vessels which have the Gatling guns supplied to them are to have one cutter fitted like the Monarch's cuttter.

A SAFETY CAR SHOE.—An exchange gives the following account of a car shoe invented by a Mr. Stillson of Minneapolis, Minnesota, and designed to prevent cars from leaving the track: "It consists of a clamp-like arrangement which is affixed between the wheels of each truck. This runs about two inches above the rail, and if anything happens to throw the wheels from the track the clamp at once grasps the rail, holds the car on the track and brings the train to a halt very quickly. During one of the experiments of a curve in the road, on a down grade, a rail was removed from the track. The car having the shoe on was started down the grade, its speed being not less than 30 miles an hour. On reaching the gap the wheels jumped the track, the car settled down upon the shoe, which at once grasped the rail which had not been removed, held the car in an upright position on the track, and finally brought it to a standstill in a distance of 250 feet. At a second trial, with a speed of 15 miles an hour, the same result was accomplished, the car being brought to a halt in 30 feet."

NEW METHOD OF SIMULTANEOUS LAMP LIGHTING.—Simultaneous lamp lighting by electricity is well known; but a German engineer has invented something which he claims to be more practical and simple. The apparatus can be affixed equally to all gas jets, and it is made to act, not by any special mechanism, but simply by the increased pressure of the gas which is always laid on from the gasometer when the lamps should be lighted. The act of turning on the gas, at the main, ignites it at all the burners fitted with the new apparatus. He has pushed this invention still further, and has provided that when the pressure is diminished at the main, the gas can either be totally extinguished or let down to a thread. It is chiefly in the lighting of the streets of a town that the invention will be of practical use. Directly the gas is turned on the whole city will be simultaneously illuminated, and when in the early morning the pressure is reduced the light may be totally extinguished or gradually diminished.

A MODEL AND EXPERIMENTAL FLOUR MILL.—Prof. Isham Walker, of Lexington, Tenn., suggests that various State organizations of millers and the National Association unite and subscribe funds for the building—at Chicago, Illinois—of a model school flour mill, at a cost of $150,000. He shows that such an institution, supplied with the best examples of modern machinery, and exhibiting the latest improvements and examples of practical science in milling, would be of immense instructive advantage to millwrights throughout the country, while the stockholders, he thinks, would realize handsome dividends every year.

If Prof. Walker's idea is a good one as applied to flour mills, and we think it is—how much more valuable would it be applied to quartz mills. An experimental quartz mill, properly managed, with full publication of its results, would be worth millions to the Pacific coast, every year.

A MAMMOTH CANNON.—The new eighty-ton gun is progressing at Woolwich. When finished, this monster piece of ordnance will be greater than twice the size of the largest gun in existence, and its destructive power at fighting range proportionate. With a sixteen-inch projectile, weighing 1,650 pounds, and its maximum charge of 300 pounds of powder, it will pierce the best iron plates, twenty inches thick, at 500 yards, sixteen-inch plates at 5,300 yards, and will pitch a sixteen-inch shell into a ship or fortress, at a distance of 10,300 yards. The steel block forming the inner tube was the largest ever cast, weighing over twelve tons; while the trunnion piece, about eighteen tons, was the largest ever produced at the arsenal. The actual cost of this fearful engine of war will not fall far short of $42,500.

IMPROVEMENTS IN CAST IRON.—The Philadelphia *Trade Journal*, in an editorial on improvement in cast metals, recapitulates the advantages gained by the modern scientific manipulation of iron, in a concise and forcible manner. In the past 40 years the gross weight of our cast iron articles has been reduced fully one-half. Half a century ago the iron frame of a Washington press weighed nearly 1,000 pounds; and although it was an arch of metel 9 in. wide by 3 in. thick, so poor was its quality that it was often broken by the pull of one pressman's arm. Our present smooth light castings show an elasticity under strain which approaches the service of wrought iron, allowing a large reduction in weight of metal and in the consequent expense.

NEW BOX-MAKING MACHINE.—A novel and most ingenious machine was exhibited in operation at the recent monthly meeting of the Franklin Institute, viz: Heyl's machine for making paper boxes. This invention performs with marvelous celerity all the movements of the human operator, and turns out boxes of all desired sizes ready for use. The machine is capable of turning out from 60 to 100 boxes per minute, according to the size of the box. The machines, though but recently brought to public notice, are already kept busily at work filling orders, and there can be little doubt that they will bring about a speedy revolution in the box trade.

AN EXPENSIVE ROAD.—A curious experiment in paving is being tried at Liege. The road is first paved with stone, then covered with asphalte, and on this are laid blocks of cast iron, two inches thick—a rather costly kind of road.

SCIENTIFIC PROGRESS.

A New Mineral—"Rivotite."

Mr. Dnclonx has discovered a new mineral which he has named *Rivotite*, in honor of M. Rivot, late Professor in the Paris School of Mines. It is found in small irregular masses, dispersed in a yellowish-white chalk, upon the western slope of the Sierra del Cadi, in the Spanish province of Lérida. It is a compact mineral; its color varies from light yellowish-green to dark greyish-green. The color of the dust is light green-grey. It is amorphous, and has a stony aspect, completely opaque and of unequal fracture. Its hardness is about that of fluor spar. It is tolerably fragile, and the blow of the hammer breaks it into fragments somewhat resembling bran. Its specific gravity varies from 3.55 and 3 62. Generally, in all the specimens of any considerable size, there may be seen plates of green and fibrous carbonated copper, which is often found also at the contact of the mineral with the chalk. The appearances which Rivotite presents with the blow-pips are as follows: A fragment of the regular size, warmed between pincers of platinum, decrepitates; but a smaller fragment fuses and the exterior flame takes a green color. Merely warmed upon coal in the flame of reduction it melts, and metallic globules are seen; it gives out no arsenical smell nor antimonial smoke; the coal receives no deposit whatever. Heated in the closed tube it becomes black, gives out carbonic acid, and a little hygrometric water, neutral with reactive papers. In the open tube the same reaction is observed.

With carbonate of soda upon the coal, in the flame of reduction, it presents an opaque mass which upon a thin plate of silver does not present the reaction of sulphur. On platinum wire with borax and phosphorescent salt it dissolves with effervescence, producing, in two flames, the peculiar reactions of copper.

A mixture of 100 milligrammes of the dust of this mineral, 100 of carbonete of soda and 50 of borax, melted upon coal in the flame of reduction, produces a grey metallic grain which is very brittle. Kept in fusion in the flame of oxidation, this grain produces a quantity of antimonial smoke, and the coal receives the deposit peculiar to this metal. After a great deal of blowing there remains a globule of red copper, which is malleable, weighing 29 milligrammes. This globule melted with 750 milligrammes of pure lead and a little borax and afterwards refined, produces a grain of silver 1.1 milligramme (11 per cent.).

When cold, and treated with chlorhydric acid, Rivotite gives out a sharp carbonic acid, but does not completely dissolve. When hot, on the contrary, it is dissolved with facility, and nothing remains but a slight deposit of chloride of silver. The chlorhydric solution is thickened by the addition of water, even if first adding tartaric acid. Concentrated nitric acid attacks this mineral with facility, leaving a yellowish residue which consists of antimony for the most part. Concentrated ammonia also attacks it, when it takes a deep sky blue. Pulverised and boiled in a solution of potash it turns black; the liquid, decanted, turns white by the addition of nitrate of silver. The chlorhydric solution of the mineral by boiling it with iodide of potassium, exempt from acid, produces a liquid of a dark chestnut color. These reactions prove that it contains antimony in the state of antimonic acid.

Quantitive analysis gives following results: Oxide of copper, 0.2950; carbonic acid, 0.2100; oxide of silver, 0.0118; antimonic acid, 0.4200; lime, traces; total, 1.0368.

The formula $Sb^2O^5 + 4 \left\{ \begin{matrix} Cu\ O, \\ Ag. \end{matrix} \right.$ Co^2 appears to represent this composition with sufficient exactitude.

The only mineral to which Rivotite can be compared, in the discoverer's opinion, with respect to its composition, is Selhita. Except that in the latter species antimony has been indicated in the state of oxide of antimony Sb^2O^3, the analogy could not but be evident. —*Iron.*

THE OCEAN'S FLOOR.—Before the times of ocean telegraph cables, very little had been done in deep-sea sounding; but when the laying of ocean cables came first to be contemplated, and when it came afterwards to be realized, the obtaining of numerous soundings became a matter of essential practical importance, and the indications are that the topography of the ocean's floor will soon be almost as well known as that of the dry land.

THE SPECTROSCOPE.—In a late annual report of the Royal mint, Mr. Wm. Chandler Roberts, the chemist of the mint (who with Mr. J. Norman Lockyer, the pioneer in spectroscopic research, has been conducting a series of experiments), states that he is satisfied that by means of the spectroscope very minute differences in composition of gold-copper alloys can be ascertained.

A COLORIMETRIC TEST FOR GOLD IN QUARTZ. The quartz, after being well ground and calcined, is treated with a bath of iodine or bromine-water, and allowed to digest in it for some time. A piece of filter-paper is then soaked in the solution, dried and burned to ashes in a muffle. If gold is present the ash is purple.

EXTRAORDINARY REFLECTION.—In some remarks at the late meeting of the British Association for the Advancement of Science, Prof. Curtis remarked as a notable fact that while so much is written about extraordinary refraction of light, nothing is said about extraordinary reflection, though Huggins' theory is applicable to both alike. Of light falling upon a crystal surrounded with air, part will be reflected at the bounding surface and part refracted, the latter portion being split into two rays, whether the crystal be uniaxial or biaxial, each of which rays will suffer double reflection at the point where they again reach the bounding surface of the crystal. In the case where the bounding surfaces are parallel, the planes of polarization are the same as those of the other. This is not true of the intensities, as one of the four intensities may be zero while the others remain finite. When the incident light is not polarized, the number of reflected rays will pass from four to three, and from three to two, as the crystal is turned around a vertical axis. With polarized light, the reflected rays may be four, three, two or one.

ELASTIC REACTION BY TORSION.—From a communication by Dr. Nessen, presented to the Academy of Sciences of Berlin, by Helmholtz, it appears that the former has been investigating the reaction observed after twisting a string of india rubber. This substance is peculiarly interesting, because of its remarkable combination of the properties of viscosity and elasticity. The observations of Dr. Nessen, made with an apparatus of considerable delicacy, lead to results somewhat different from those of Kohlrausch. He finds the strings to be highly susceptible to the least radiation of warmth; but, avoiding this source of error, he concludes that the elastic reaction in the case of torsion follows the law expressed by a simple exponential curve. The magnitude of the reaction increases with the diminution of temperature, as also with increasing angle of torsion, and increasing duration as to time. The coefficient of elastic reaction increases with increasing temperature only, being independent of the extent of the duration of the torsion.

VARIATIONS OF LIQUID SUBSTANCES.—The undulations which are produced upon liquid surfaces when a heavy tuning-fork is brought into contact with the vessel containing the liquid, have been investigated by Bartholemy. He observed the phenomena by allowing a beam of sunlight reflected from the liquid surface to fall upon a screen. Bartholemy deduces the two following laws for rectangular vessels: First, that the breadth of the undulations is inversely as the number of vibrations; and second that the distance between two lines produced by the same tuning-fork is independent of the density of the liquid. The author calls attention to the general resemblance of these wave surfaces in the basin of a fountain, to the waves of the sea; even in the sand on the sea beach they may be recognized; so, also clouds are often arranged in parallel bands, and an ingenious application of these facts accounts for the phenomena of stratification produced by electric discharges in rarified media.

INTERESTING AND PRETTY EXPERIMENT.—The combustibility of iron is a chemical fact well known, but a Berlin experimenter has demonstrated the phenomenon in a manner peculiarly his own; he takes a straight bar magnet of some power, and sprinkles iron filings on one of its poles. These filings arrange themselves in accordance with the lines of magnetic force, and, however closely they may appear to be placed, of course no two of the metallic filaments are parallel, and consequently a certain portion of air is enclosed, as in a metallic sponge. The flame of any ordinary spirit lamp or gas burner readily ignites the finely divided iron, and it continues to burn most brilliantly for a considerable length of time, the combustion being, apparently, as natural and easy as that of any ordinary substance. If the experimenter with this operation stands on a slight elevation, and waves the magnet to and fro while burning, a magnificent rain of fire is said to be produced.

PROTECTING INFLUENCE OF THE EARTH'S ATMOSPHERE.—Weilman, after reducing the hourly observations made at Berne, Switzerland, for seven years, and deducing therefrom the laws of diurnal change of temperature, has investigated the effect of cloudiness on the daily variation, especially at night. He finds that the radiating power of the earth's surface is everywhere and at all times the same. The temperature in the morning is, he finds, in cloudy weather, five or six degrees higher than in clear weather. And again that the simple atmosphere of the earth surrounds it like a protecting layer of clouds, and that without this the earth would experience daily an enormous variation in temperature. Even the clear sky, or rather the moisture present, as an invisible vapor, protects the earth with an efficiency equal to about one-third of that exerted by a layer of clouds, against too strong a daily change of temperature.

DISCOVERY AT HERCULANEUM.—The Italian journals notice an interesting archæological discovery of some importance recently made in Herculaneum. It is a silver bust of life-size, and in an excellent state of preservation. It is impossible at present to say whether it is cast or worked with the chisel, or whom it may represent. It is said to be the first discovery of its kind made either at Herculaneum or Pompeii.

Mining Stocks.

Stocks have been much more active this this week. The principal excitement was the nnexpscted "deal" in Ophir, which enrprised outsiders by the snddenness and extent of tbe rise. Tbers has been qnite a strnggle to get control of tbis mine, and in order to secure a majority of shares before the election next month, the opposing parties have bid very ebarply. On the street, Wednesday noon, Ophir sold for $150—a small lot. Con. Virginia, California and Best & Belcher have been very strong indeed. The immediate prospects are favorable to a further rise. Overman and Sog. Belcher have been comparatively dnll.

Thoss who claim to be wise in stocks say that tbe rise of the year has as yet hardly begnn. In compariеon with the market one year ago, the Comstocks, with the exception of the Ophir, Con. Virginia group and Exchequer, are very low. Savage, Hale & Norcross, Yellow Jacket, Sisrra Nevada, Silver Hill and other stocks have not shown any such advance as is usnally ths case. Baltimore Consolidated is as low as last summer, thongh this favorite gambling stock sells at three or four times its present price when the market is really high. The same may be said of nearly all the Cometocks. So it wonld not be at all snrpricing if the whole line should advance largely.

Outeide of Washoe etocks the market was dnll. The Idahos and Californias suffered severely.

Tbe Con. Virginia dividend, paid on the 11th inst., was as nsual $3 per share Belcher and Crown Point each paid $3 per share. Cbarior Mill has declared its fourth dividend, of 40 cents per share, payable on the 16th inst. The Belcher dividend aggregates $312,000; the Con. Virginia, $324,000; and ths Crown Point, $300,000. Tbus the totals for November sbow a pretty fair yield, considering that ths bnlk comes from only three mines.

Concerning the wonderful developments in the Con. Virginia the *Enterprise* says: During the past week a considerable number of persons have visited and examined the lower levels of the Cons. Virginia. All are astonished at the exceeding richness and vast extent of the ore bodies now laid bare. They come out of the mine declaring tbat the half bas never yet been told. What astouuds all is the fact that large as tbe ore bodies are, they are still widening and expanding—looking almost as tbough likely to prove boundless. It would be a good joke on tbe company should they be nnable to find any east wall—if they should find nothing in that direction but "blarsted" silver ore, tied together with wires of gold.

New Incorporations.

The following companies have filed certificates of incorporation in the County Clerk's Office, San Francisco:

IDA CLAYTON AND GREAT WESTERN WAGON ROAD CO.—Oct. 5. Object, to construct and operate a toll wagon road through a portion of the counties of Sonoma, Naps and Lake. The road will begin near the house formerly occnpied by Thomas Knight, in Knight's valley, Sonoma connty, thence to run in a northeasterly direction across the northerly portion of Napa county, and over a portion of Lake county to the Great Western quicksilver mine in Lake county. Directors, William A. Stuart, Charles Laird, G. P. Kellogg, W. S. Bartlett and A. H. Connolly. Capital stock $20,000, divided into 200 shares of the value of $100 each.

BADGER M. & M. Co.—Nov 6. Location: Colnmbns District, Humboldt county, Nevada. Directors, C H. Bogart, S. E. Holcombe, W. A. Bolinger, A. Hemme and Stillman H. Pitman. Capital stock $3,000,000, divided into 30,000 shares.

PHELPS HILL GRAVEL M. Co.—Nov. 6. Location: Phelps Hill, Nevada county, California. Directors—O. H. Bogart, W. M. Smith, J. B. Treadwell, F. H. Hill, W. G. Alhan. Capital stock $2,000,000, divided into 40,000 shares.

CRESCENT M. & M. Co.—Nov. 6. Location: Crescent Mills, Plumas county, California. Directors—O. H. Bogart, S. E. Holcombe, W. A. Bolinger, C. E. Gibbs, A. Hemme; capital stock $1,000,000, divided into 60,000 shares.

EAMES & WALBRIDGE FURNACE CO.—Nov. 6. Object: To buy, sell and manufa ture quicksilver and other furnaces, etc. Directors—H. H. Eames, W. D. Walbridge, R. D. Walbridge, A. P. Minear, Frank Swift. Capital stock $100,000, divided into 1000 shares.

NIAGARA M. CO. No. ONE.—Nov. 7. Location: Gold Hill Mining District, Storey county, Nevada. Directors—J. H. Pritchard, W. T. O'Neale, M. T. Brackett, I. I. Holmes and W. E. Hale. Capital stock $6,000,000, divided into 60,000 shares.

WELOH CON. Q. M. Co.—Nov. 7. Location: Mt. Diablo Mining District, Contra Costa county, California. Directors—S. Philips, E. J. Ryan, G. Hearst, J. P. Forbes, A. C. Corbett. Capital stock $10,000,000, divided into 100,000 shares.

ST. PAUL G. & S. M. Co.—Nov. 9. Location: State of California. Directors—I. I. Holmes, J. M. Winslow, J. A. Conlee, Paul Riegar and W. R. Steele. Capital stock $8,000,000, divided into 80,000 shares.

GARDEN VALLEY M. Co.—Nov. 1. Location: Garden Valley Mining District, El Dorado county, California. Directors—E. G. Waite, H. T. Wheeler, Walter Mead, E. R. Rockwood and C. W. Miller. Capital stock $2,400,000, divided into 24,000 shares.

SHASTA BULLION M. Co.—Nov 11. Location: Soulh Fork Mining District, Shasta county, California. Directors—W. T. Reynolds, H. H. Hubhard, Geo. Freeland, G. S. Keyes and C. H. Dewey. Capital stock $6,000,000, divided into 60,000 shares.

The following companies have filed certificates of incorporation in the office of the secretary of State, at Sacramento, Nov. 11.

TRINITY QUICKSILVER M. Co. — Location: Trinity county: Capital stock $1,000,000, in shares of $100 each. Directors—James G Trotter, M. H Lowden, E. P. Lovejoy, W. G. Tinnin, John McMurry, M. F. Griffin and Henry Martin. The principal place of business, Weaverville.

MONITOR M Co.—Location: Plumas county, California. Capital stock $40,000, in 160 shares. Directors—Frank Amann, D. R. White, C. R. Spencer, S. B. Pettingill and D. O. Webster. The principal place of business will be in Gibsonville.

MINING SHAREHOLDERS' DIRECTORY.

THE daily yield of ore dnring last week from the Comstock minee was as follows: Belcher. 550 tons; Crown Point, 500 tons; Consolidated Virginia, 300 tone; Ophir, 100 tons; Chollar, 80 tons; Sierra Nevada, 65 tone; Dayton, 50 tons —making a total of 1,645 tons from seven leading minee on the Cometock.

WE hear, says the Inyo *Independent*, that Jones and Stewart have pnrcbased the noted Panamint mine known as "Jacobe' Wonder," and the mill in conrse of erection belonging to the same parties. Our informant could not give the amount paid except that it exceeded $110,000.

MINING SUMMARY.

THE following is mostly condensed from jonrnals pnblished in the interior, in proximity to the mines mentioned.

California.

ALAMEDA COUNTY.

COAL AT SUNOL.—Cor. *California Reporter*, Nov. 7: A party is prospecting for coal about a mile west of tbis station with a small force, which will be increased if indications warrant. They snnk an incline on the hill side to a depth of 90 feet, passing through two small veins of coal, when they encountered quite a body of water, which compelled them to snspend operations in that direction. They have now moved down the hill some 400 feet, and have commenced a tunnsl, which they expect will strike the main vsin, or body of coal, at a distance of 600 fest. Witbin twelve fset of the mouth of the tunnel they struck a coal ssam, 8 or 10 inches wide, which is considered a very favorable omen. The discovery of a reliable coal mine so near the city wonld cheapsn the price of fnel very mnch.

AMADOR COUNTY.

MINING.—*Ledger*, Nov. 7: Preparations are being actively made to open up a number of hydranlic claims in the vicinity of Jackson. We are pleased to learn that the quartz mines in process of development in the county are looking very promising. The Bunker Hill gives evsry indication of a very valnable mine. The ledge is large, well-defined, and much of the rock will mill $25 to tbe ton. A mill is being erected, and ae soon as it is put in crnshing order the retnrns from Bunker Hill will be satisfactory to the owners. This Original Amador, at Amador City, is showing up richer rock than ever before discovered in that mine. Our informant says the mine never looked more promising than at present, with every appsarance of oontinning its present promising indications. The Gover, at Drytown, at the lowest depths reaohsd, shows an immense vein of ore, which will pay a fair return in free gold, besides being heavily charged with gold-bearing sulphnrets. From the depth reached in tbis mine, and the vsst qnantity of ore laid bare, it can be safely said the Gover is no longer an experiment, bnt that it has bsen developed into a permanent paying mine. The Alpine, at Plymonth, as sinking progresses in the main shaft, shows richer rock than at less depths, and more of it. The last rock taken out is represented as heing extra rich in free gold, and the qnantity of ore increasing, no doubt is entertained by practical miners as to the ultimats success of tbe Alpine. The owners deserve success, and the conductors of the working of the mine dessrve credit for the judgment manifested in the labor of development. The Oneida likewise keeps up ite ehow of good paying rock, and at no time has ths mine given more satisfactory evidence of value than at present.

CALAVERAS COUNTY.

MINING PROSPECTS.—*Chronicle*, Nov. 7: An abundance of water is all that is required to keep tbe gravel mining interest in its present leading position, and plenty of rain has fallen to warrant that, at least during the greater portion of the year. The quartz mining interest, we can truthfully say, was never in a healtbier condition. From the West Point, Mosquito and Sheep Ranch districts reports are especially pleasing. Permansnt development is steadily progressing, and tbe practical results of operations are extremely flattering. The Gwin and other well known mines throughout the the county continne to be profitably worked, and their yield increases as the development progresses. New enterprisss are constantly being engaged in, and extraordinary advsncsment made in unfolding the mineral resources of the county.

A SPLENDID MINE.—The gross product of the Wallace & Ferguson for the year ending October 31st, 1874, was $61,000. That amonnt was taken out and sent to the U. S. Mint in San Francisco. Tbe expsnse of working the mine and milling the ore ranged from $800 to $1,200 per month dnring that period. Taking $1,000 per month as the average expense, the net profit of the mine for the year was $49,000. It must be recollected that ths ledge is not worked npon an extensive scale, it being only necessary to take out rock fast enongh to supply a five-stamp mill, that boing tbe capacity of tbe bettery that has done all the crushing.

EL DORADO COUNTY.

TAYLOR MINE.—*Republican*, Nov. 5: W. T. Gibbs, now snperintendent of this mine, reports the mine as looking highly satisfactory. Five more stampe are to be added to the mill immediately, and are now being turned out at the Placerville foundry. There is now ont, rsedy for ornshing, about 200 tons of rock, and the amonnt is daily increasing.

INYO COUNTY.

PANAMINT NEWS.—*Independent*, Nov. 7: The cañon or town eite, is very narrow; the widest place euitable for hnildings is not to exceed 300 ft., and mnch of it not that wide. The monntains on either eide are very rocky and precipitone. In blasting roads in the face of these monntains rock ia thrown clear across to the opposite monntain, occasionally plnmping down in the streete, which of itself has a tendency to make things lively. There is rarely a moment during the day or night when the reports of reverberations of the ebots are not heard. Work goee on in the minee at all hours, on the roads only in the daytime.

KERN COUNTY.

St. John and Bella Union.—*Southern California*, Nov. 5: The St. John mine, at Sageland, is now being worked on the 500-ft. level, where an unusually rich chimney is being taken out. A shaft has been put down to the 700-ft. level, and it is expected when the level is completed at this depth the rock will prove still better, from present indications. This mine is located in the low hills, to the east of the Bright Star mine on the Pinte mountains, some fifteen miles. The Bella Union mine, at Claraville, owned by A. H. Deaker, has been giving up good ore during the past few months. Mr. Denker informs us that he will next spring put up a 20-stamp mill, having at this time only five stamps. He will get greater power and have a good pump, to be prepared for water if it should be found in too great a quantity. He intends to go down about 300 ft. further before he commences taking out ore. It is the richest small mine in the country at this time, the vein being only about three feet in width.

LAKE COUNTY.

Clear Lake District.—*Bee*, Nov. 5: There has been considerable prospecting for cinnabar on the opposite side of the lake during the past two months, and the eager search is still going on. A good many claims have been taken up and notices of possession posted. Good cinnabar rock has been struck in the Parker claim, and all the ground in the vicinity of the mine is already claimed, mostly by Lakeporters. We have great confidence that mines as rich as those at Pine Flat will eventually be discovered in this district. There are strong indications of the existence of cinnabar in the mountains all around the lake, and the question whether this valuable mineral can be found here in paying quantities is likely to be settled in the course of a few months.

MENDOCINO COUNTY.

New Mining District.—*Independent Dispatch*, Nov. 7: A mining district has been organized including the newly discovered silver mines on Mt. San Hedrin. Two assays have been made of the ores of this mine. The first produced $5 40 per ton, and the next one $2.25. A mining company has been organized, with the following incorporators: S. Hornbrook, D. C. Dormaa, J. M. Ellis, C. H. Eberle, C. Edsal, Philip Deuel, Pollard, D. Ayres, T. Z. Bransford, D. Arthur, Martin Corbit, T. J. Howard,

MARIPOSA COUNTY.

Suit.—*Gazette*, Nov. 7: Last week an attachment suit was brought by parties resident in Bear valley against the Mariposa Land and Mining Co. We learn that the suit is likely to be settled in a few days.

Working Well.—The little engine set up by John H. Neal at the Mexican mine, on Bockeye creek, does its work well. The shaft is clear of water, and the ore taken out appears to be of the right sort.

Milling.—Dan. Breen is crushing refuse quartz from the Hart mine, Sebastapol, at his mill on Mariposa creek.

NAPA COUNTY.

St. Helena Mines.—*Star*, Nov. 5: Pickett Bros. last Tuesday forwarded to Lane & Co., San Francisco, 48 sacks of assorted rocks, weighing over two tons, from which they expect to get over $2,000 in gold, besides $1,000 in silver. The discovery of this mine was purely accidental, the circumstances of which are peculiar, and show how easily a man oftentimes has wealth thrust upon him. A short time ago while one of the Pickett brothers was on a hunting expedition he shot and pursued a deer by its trail of blood, for nearly a mile. Arriving where the mine is he found the deer dead, lying directly over the ledge. Not calculating that any fortune like a mine was to be developed by his bad shot, he proceeded to build a fire, when scraping away the brush the peculiar iron discoloration of the rock first attracted his attention. After supper Mr. Pickett carelessly broke a piece of the rock from the ledge—when his "heart jumped into his throat," so surprised was he at the eight of the glitter of real free gold—if the truth was known it would not be out of place to say he jumped and whooped like an Indian. The discovery was for reasons best known to the discoverer kept secret. The mine is located in what is known as Cow Woods, some six miles from St. Helena. The ledge is traceable for a long distance and averages in width over three and a half feet. A force of miners are sinking a shaft, and the proprietors are already preparing to put up a mill.

Cinnabar.—A splendid average yield of a new cinnabar mine was made by the Barnett Bros. last week; forty-eight pounds of rock produced six pounds of quicksilver. The mine is located near the upper end of James' creek.

Silverado.—Cor. *Register*, Nov. 7: The Calistoga mine is the pioneer of silver mines; has about 65 or 70 men employed at the mine, and 20 or more at the mill. Four tunnels have been run into the mountain, and there seems to be a whole mountain of ore, and there can be no doubt but this is destined to be the greatest mining district on the Pacific. The mill is a ten-stamp one and turns out about $1,000 per day. Four large bricks were sent down to-day; they will go about $12,000. The St. Paul mine on the Calistoga side promises well. A tunnel is being run, and a fine lot of ore extracted, which assays from $80 to $100 per ton. The St. Peter mine adjoins the St. Paul, and is equally as good. These two mines are owned by Messrs. J. A. Conlee, J. J. Holmes and J. W. Winslow; the two latter are San Francisco men. Work will be pushed forward on these two mines as fast as possible.

Shipment. — *Reporter*, Nov. 7: Fourteen flasks quicksilver from the Manhattan, and 15 from the California came down yesterday.

NEVADA COUNTY.

Blue Tent.—*Transcript*, Nov. 4: The Blue Tent Consolidated mining company had a line surveyed the present season for a ditch to bring water to their mine at Blue Tent. Work was commenced at the head of the ditch and prosecuted with all the dispatch possible until the late storms drove them out of the mountains. There is now four miles of flume completed and it is thought further work will have to be postponed until spring.

Gold Run Mine.—*Transcript*, Nov. 6: Work still continues on the Gold Run shaft. The depth now attained is 161 feet. The ground has to be blasted, but it is favorable to sinking. It is the intention of the company to sink 250 feet before running a drift. At that depth they will run for the chute of rock on the same ledge formerly worked by Captain Kidd, and which was the richest ever taken out on Gold Flat. The depth at which the rock was taken out at that time, was much less than where the drift will strike the chute. A rich ledge has been known to exist there for years, but it was also known that deep working and machinery was necessary to develop it.

North Bloomfield.—We learn from A A. Smith that the tunnel being run into the claims of the North Bloomfield company will be completed in about 10 days. The flume will be done in less than a month, and all will then be ready for operations.

New York Hill.—*Tidings*, Nov. 7: This mine continues to improve as the explorations progress. A lot of rock now on hand and to be worked next week at the Larrimer Mill, it is thought, will give a better yield than any run yet made. This rock has been taken out along the course of the tunnel, now 650 feet in—360 along the ledge—and the continued improvement of the vein as opened at greater depth, shows well for the future of this mine.

In Luck.—A gravel claim over at Iowa Hill in which the Messrs. Coleman of this place are largely interested, is, we are glad to learn, turning out very rich of late. Until recently the claim has not been working to advantage owing to a lack of water. The new ditch gives them 1,000 inches under a 500-ft. pressure. These gentlemen are large owners also in the Rising Sun quartz mine, between this city and Colfax. This mine has divided to the stockholders quite a nice little sum the past year from the run of five stamps, and are they are now adding ten stamps to the capacity of the mill it promises to take a prominent place among paying mines the coming year.

Omega Water and Mining Co.—*Transcript*, Nov. 11: The above company, whose mine is located at Omega, are making extensive improvements for work the coming season. The tunnel through which the flume passes is being enlarged, so that a flume six feet in width can be put in and have a capacity to run off all the dirt that the amount of water they have will be capable of washing. The mine paid the largest kind of dividends last season, and with the improved facilities for working the coming season, will demonstrate, what all who are acquainted with the mine now know, that it is one of the best in the county. It is safe to put the net profits the coming year at $60,000.

PLACER COUNTY.

Items.—*Argus*, Nov. 7: There is great activity all over the county in fitting up mining grounds, and the early rains give promise of an unusually prosperous season. The Sucker Flat claim, near Iowa Hill, has been sold by Messrs. Harper, Langstaff and Byrne to an incorporated company organized in San Francisco. The Booth mining company sent a couple of handsome bricks below last Sunday. They were worth about $1,800.

Good Clean-up.—*Herald*, Nov. 7: The Booth mining company cleaned up last Saturday, from a run of about 140 tons of ore, 238 oz. and 16 dwt. of the precious metal, or a little over $4,000; making within a small fraction of $30 to the ton. Considering that the total expense of mining, hauling and milling this ore did not exceed $1,300, this is certainly a very encouraging result. At the mine the indications for even better results in the future are indeed flattering. The east drift, which is in nearly 300 ft., has developed good paying rock all the way, and is growing better instead of worse. At the bottom of the main shaft, now close to 100 ft. deep, the ledge is 6 ft. thick, and the ore, judging from the specimen we saw a few days ago, fabulously rich. The work on this mine, so far, to sinking and drifting, with a view to its better development; yet the rock taken out in this work, from the above showing, pays a handsome profit to its owners, over and above all expenses.

SONOMA COUNTY.

Gold at Santa Rosa.—*Democrat*, Nov. 7: Last summer two brothers named Pickett, of San Francisco, were hunting in this vicinity. Their attention was attracted to the ledge, they had assays made, which proved the rock rich in gold. An agreement was made with Mr. McGuire, the owner of the land, in regard to title; a quantity of the rock was taken to San Francisco and the assay was still more satisfactory. Work was commenced regularly Wednesday of last week. The tunnel extends into the hill about 15 ft. Two tons of rock have just been shipped to be worked in San Francisco. The rock has a reddish color and through a glass presents a beautiful appearance. If the half that is told is true the discovery is important.

TRINITY COUNTY.

Another Claim.—*Journal*, Nov. 7: The Weaverville D. & H. M. Co. will work the Ware mine on Sydney hill and the Ward mine on Oregon Gulch mountain the coming winter.

TUOLUMNE COUNTY.

The Kincain.—*Union Democrat*, Nov. 7: This claim is again in operation; the huge banks are being torn into pieces with a fierce stream of water. Soon after commencing piping on Tuesday suddenly the water stopped to the surprise of all hands; on taking the pipe apart a dead fox was found forced into the muzzle. Reynard had a tight fit with several hundred inches of water on his earthly remains.

Spring Gulch Mine.—A car track from this mine to the mill was commenced on Tuesday, when the first rail was laid, and a new shaft is being sunk on the lead. The railroad is to be a mile and a quarter in length and requires three weeks for completion. When finished the reduction of ore will be uninterrupted, unless at some season for want of water. The prospect for the mine is splendid and will return its owners a handsome profit.

Nevada.

WASHOE DISTRICT.

Consolidated Virginia.—Gold Hill *News*, Nov. 5: Daily yield, 300 tons of ore. The ore breaste on the 1,300, 1,400 and 1,500-ft. levels are all looking splendidly, and are being carried forward as usual. The north drifts on the 1,300 and 1,400-ft. levels, running ahead of the ore breasts, are still in ore of a rich character. On the 1,500-ft. level the east and west cross-cuts have developed the ore vein 128 ft. in width, with the face of both still in rich ore. The ledge on this level shows a steady swell in the width, which seems to increase to the northward toward the California line. The face of the north drift on the 1,555-ft. level is still in ore of the richest character, the extent of which is yet entirely undetermined in any direction whatever. The new mill is covered in, and much of the machinery in place. The immense compound engine is on the ground, and it will now be but a very short time before the mill will be ready to start up.

Ophir.—Daily yield, 100 tons of ore, which can be easily doubled whenever mills can be obtained to crush it. The mine is looking splendidly throughout. The development of the ore bodies on the 1,300-ft. level is daily establishing the mine on a more promising basis. The ore at the bottom of the winze in the east crosscut No. 2, on the 1,300-ft. level, is still of the same rich character, and there is no longer a doubt but that the rich ore development in the east crosscut No. 2, on the 1,465-ft. level, 60 ft. further to the westward, is a continuation of the same body. The yield of the mine for the past month was a little over $80,000, which will probably be doubled this month, as it is the expectation that the company will have three mills running on ore from the mine before the close of the month. Car samples assay from $90 to $220 per ton.

Woonville.—The mine is looking well throughout. During the past week a fine body of ore was struck going southward on the 300-ft. level. This ore lies further to the southward than anything yet found on that level. The ore carries a large percentage of gold, and promises a fine rich body of ore. The ore body on the 300-ft. level has been developed 143 ft. in length. The mill is kept steadily running on ore from the mine. The average assay of the pulp from the batteries is about $40 per ton.

Gould & Curry.—The water has been reduced to the 1,700-ft. level with a fair prospect of soon having the lower levels again drained ready to resume prospecting in that portion of the mine. The usual amount of crosscutting and prospecting is being done on the 1,500-ft. level.

Kossuth.—Sinking the main shaft is making the usual good headway. No water to interfere with the progress of the work.

Original Gold Hill.—New building over the hoisting works advancing towards completion. The ore indications in the face of the west drift at the 340-ft. level still showing finely.

Sutro.—Main west tunnel driving ahead without change of interest to chronicle.

Indus.—The incline being sunk from the tunnel level is now its full size in ore and improving.

Sierra Nevada.—Sinking the new shaft is making steady progress. The ore body, in the north drift from the Sierra Nevada tunnel, is opening out splendidly and promises a fine yield of good ore. Daily yield, 65 tons of ore, keeping the mill steadily running.

Daney.—The main west drift on the 400-ft. level night before last cut the ore vein, causing a strong flow of water and exposing some fine white Comstock quartz and ore of a very promising character. The flow of water has been so strong since that no progress has been made with the drift. As soon as the water is drained, crosscutting the ledge will be commenced.

Baltimore Consolidated.—The water has been drained and sinking the main shaft resumed. The crosscuts on the 400-ft. level north are showing some very favorable indications of ore. The flow of water from the east crosscut, on the 750-ft. level, has almost entirely ceased, and work has been resumed in the face of the drift. The indications of finding ore in this drift are very favorable.

Leo.—Rock in face of main tunnel somewhat softer again, so that better progress is being made this week.

American Flat.—Work has again been resumed. The prospects of finding ore in this drift are much more favorable, as it is likely to strike the main ore vein in a few days more.

Julia.—The machinery will soon be in condition to work the mine to a much better advantage than it has ever been heretofore.

Utah.—The flow of water at the bottom of the shaft remains much the same as for the past month. The prospecting drifts north on the 400-ft. level have developed a considerable body of quartz of a lively encouraging character, but nothing that will yet pay the cost of extraction and reduction.

Dardanelles.—Drifting for the ledge and making good progress, although the rock is hard.

Imperial-Empire.—The main east drift on the 2,000-ft. level is being pushed with all the energy possible, with every indication of soon cutting the ore vein. Both the north and south winzes on the 1,850-ft. level are still in fine ore.

Dayton.—Daily yield, 50 tons of ore, keeping the Woodworth mill steadily running. The ore stopes on both the second and third stetione are looking well and yielding the usual amount of good ore.

Mint.—The bottom of the shaft is still in quartz of a fine character, and the indications are that a good ledge will soon be cut.

Savage.—Sinking on the main incline, below the 2,100-ft. level, is being pushed ahead with all the energy possible. Sinking the winze from the south drift of the 2,000-ft. level goes steadily on.

New York.—The several prospecting drifts on the 550-ft. level are still driven vigorously ahead. The main west drift on the 700-ft. level is still pushed vigorously ahead to cut the ore vein on that level.

Hale and Norcross.—Sinking the main incline below the 2,100-ft. level is making fine progress. It is now down 39 ft. Daily yield, 40 tons of ore from the old upper workings.

Lady Bryan.—The new pumping machinery is nearly ready to run. As soon as it is completed sinking the shaft will be resumed.

Union Consolidated.—The east crosscut from the main north drift on the 1,300-ft. level is showing steady and favorable improvement.

Bullion.—The north drift on the 1,700-ft. level of the Imperial shaft still shows a steady improvement and there is but little doubt that when crosscutting of the ledge shall take place some fine ore developments will be made.

Chollar-Potosi.—Daily yield, 80 tons of ore, the assay value of which is $28 per ton.

Overman.—Sinking the main shaft below the 1,200-ft. level is making good progress. The prospects of the ore body in the north drift on the 1 200-ft. level continue quite favorable.

Succor.—Driving the main west drift to cut and prospect the ore vein on the 550-ft. level of the Grant shaft is making good progress.

Rock Island.—The main west drift on the 200-ft. level has cut through the body of clay recently encountered, into a body of fine looking quartz and low grade ore.

Lady Washington.—Sinking the main shaft is making good progress.

Phil Sheaidan.—West drift from the shaft in 62 ft. Face in porphyry, quertz and blue clay, with some little increase of water since last report.

Senator.—The prospecting drifts on the 400-ft. level are still driving vigorously ahead without change of interest to record.

Yellow Jacket.—Sinking the main incline is making fair progress. Nothing new to report of the prospecting drifts on the 1,740-ft. level.

Buckeye.—The mill is kept steadily running.

Justice.—There is but little change in the mine during the past week. Work progressing as usual at all points.

Pictou.—Tunnel driving ahead at a lively rate with two shifts of men working. Rock softer then it was last week.

Gennessee No. 2.—Bottom of shaft in hard blasting ground, consisting of porphyry and quartz mixed.

East Belcher.—New shaft sinking at the rate of about two ft. per day.

Iowa.—The west drift running for the ledge is making good progress.

Belcher.—Daily yield, 550 tons of ore. The ore breasts on the 1,200, 1,300 and 1,400-ft. levels are all looking well and yielding the usual amount of good ore. A delay of one day was caused by the burning out of the timbers of the new air shaft on Friday last. The delay was only temporary, all the men being at their work in the different portions of the mine the next morning. The mills are still running up to their full working capacity, and the mine looking well and prosperous throughout.

Crown Point.—The mine is looking well throughout. Daily yield, 500 tons of ore. The ore breasts on the 1,400-ft. level are yielding splendidly, while those of the 1,500-ft. level are opening out better every day. The face of the south drift, on the 1,500-ft. level, is still in fine ore. The 1,600-ft. station is about completed, and a drift started for the ledge on that level. The mills are all running up to their full capacity.

California.—The north drift on the 1,500-ft. level from the Consolidated Virginia is pushed vigorously ahead, about half the face of the drift in ore which assays from $15 to $30 per ton. The face of the north drift on the same level from the Ophir is also in low grade ore.

Florida.—Putting up the new hoisting and pumping machinery is going ahead, although somewhat retarded from having to wait for the proper timbers.

Refining Metals.

The many disadvantagee attending the dry procese of refining metals hsve long been generally acknowledged. The loss which it entaile, owing to the large percentage of the metale which is carried away in the slsg, forms eo eerious an item in low grade ores, the proportion increasing with the poornes of the material, as to make their redniction along with the other coste ntterly nnprofitable. In the case of refractory ores, even when comparstively rich, the amount thus lost ie also increaeed from the fact of the fluxee used tend to facilitate the nnion of the metale with the refuse or slag. This ie particularly remarkable in lead ores, it heing almost impossible to separate the lead from many of the other metale with which it ie usually fonnd in combination. For thie reason, lead oree, which have a emall admixture of eilver are not highy valued, the quantity of silver extracted not cooveriug, in many instances, the heavy ontlays for fuel, manipulation and lose from the cansee mentioned. A large number of low grade copper ores also cost so much as to render them worthless. Various different inventions have been made with the object of effecting a saving and turning such oree to profit. Thoee which are termed wet processes have proved the most satisfactory. We have now to notice a new eystem applicable to lead oree, which ie related in the *Chronique de l'Industrie*. It owes its origin to Messrs. Payen & Reux, of Maraeilles, who, after having epent a considerahle time in perfecting their system, have now erected works at the city mentioned, where they are reported to treat successfnlly the hard lead of Greece, which containe 2½ per cent. of antimony, 1 per cent of arsenic, ½ per cent. of copper, and from 1 to 2 per cent. of iron and sulphur; as also the hard Spanish lead which is known to contain large qnanties of foreign euhetances. These qualities of lead are generelly much disliked by refiners, who are uuable to make from their treatment such profits as thsy consider repay them for their labor and ontlay. The process of refining, according to the eystem of Messrs. Payen & Reux, ie said to be effected with the grestest ease and comparatively trifling outlay. In addition the great advantage is stated to be secured that all the foreign metals can be collected, ehould their valne make it worth while to save them. In the case of ores which are rich in the precious metsls or in copper, thie is most important, ae, though the quantity in the metals may he relatively small, it is all profit, no extra expense being required for its extraction beyond that which is necessarily made for refining the lead. This will be more apparent when the eystem is explained.

The procese of Mesere. Payen and Reux depends on the property which melted caustic hydrated alkali posses-es of oxidizing all metals except gold, silver and lead, and converting them into a soluble scoria in a state of igneoue fnsion. In the melted alkaline, both the metale oxidize according to their affinity for oxygen. This action is, however, modified by the particular affinity which certain metale have for soda, and also by the action of affinity of the metal which is present in greater abundance. Curious examplee are presented in the metals of tin and platinum, which, though both much more diffionlt to oxidizs than load or copper, are rapidly attacked and acted on before the latter in the eoda bsth. The cause of this ie that both tin and platinum hsve a peculiar tendenoy to act as electro-negative elements. For this reason the copper alwaye oxidizee firet in alloys though they may be very rich in lead It is aleo worthy of remark that with reagents the oxides act in the eoda hath exactly as the common metallic salts do when diesolved in water. In this igneoua solution the metals are thne precipitated according to the degree of their insolnbility in regular order, and ineolnble agents for reducing may be ueed in the bathe with perfectly eatisfactory reeults. If taken in the direct order of their solubility they materially prevent their oxidizstiou. The metals which are united with lead ore are, owing to the propertiee stated, removed one after the other by the melted soda: and the action of the bath is maintained by a steam jet which keepe up the supply of water of the hydrate which furnishes the metale with oxygen. Where the metals oxidize slowly the action is atimulated either by a blast of air or by the addition of nitrate of soda at the end of the operation. There are eaid to be no difficulties attending the process, and that it may be csrried out enccessfully by any one only snperficially acquainted with chemistry.

The principle is applicable, saye the *Mining World*, not only to refining lead, but also to the extraction of silver from lead and argentiferone scoria, by the zinc process, ae well ae to the treatment of argentiferous copper, of old oomplex alloys, and of the oree of platinum, gold, silver, chromium, and a variety of other metale. It opene up, indeed, a new field to the metallurgiet, and will enable oree which were formerly rejected to be reduced and refined with profit. Such chemical applications as the present, and the nsscent copper processes, are great and valnable inventions, which are destined to play no mean part in the future progreee of mining enterpriee. They may, and probably will, be the meane of giving a freeh impetne to mining interests in this country, which have been languishing for a considerable time past, and they will make many mines profitable which are now being worked at a lose. There are also many classes of oree in this country which are not now worked, but which, by the adoption of thie process, might be tnrned to advantage. The pecnliar action of electricity in such processes is a point deserving of most careful inquiry. We have already a system of reining by its nee alone, but the great qnestion to be eolved is the method of so regnlating the electrical condition of the metale to be treated that they may he entirely subjected to the active influence of the agents employed. Thie will doubtless be accomplished, and when it is, we ehall have learned how to prepare and refine onr metals by methods at once eimple and inexpeneive.

New Concentrating Works.

The *R. R. Reveille* eays: The Manhattan company have just completed the purchase of the Boston mill, in which they propose erecting a Krom concentrator of 50 tons capacity. The concentrations from these ores (abont 16 tons) will be worked at the Manhattsn mill, together with the first claee oree produced in the district, which do not require concentration. When these works are completed and running, the monthly production of ore in this district will be increaeed to 1,600 tone, the extraction of which will, of course, greatly increase the underground work and give employment to a large additional force of miners.

It is with mnch pleasure that we snnounce the inauguration of this enterprise by the Manhattan Co., the completion of which will doubtless be a vast benefit to the community at large. But whether it will he a euccess and thereby a profit to the company, time alone can determine; as the effective working of the ores of Lander hill by this process has not yet been demonstrated. The process hae proven successfnl in working the ores of other localities, and we see no reason why it should not be similarly so here, ae our ores are not more refractory than hase metal carrying ores of other districts. Should the concentrator prove a euccess it will reeult in material advantage to onr town, adding to our population, increasing the demand for labor, fuel and other supplies, and will utilize immense quantities of low grade oree now lying idle and useless.

Incombustible Paper.—Another attempt has been msde—and it is claimed euccessfully—by a foreign inventor, to produce an incombustible paper; not an article that ie absolutely indestrnctible by fire of any degree of fiercenees, hut one which will, under such circnmetances as fires in housee, factories and other buildinge, be measnrably fire-proof, and thus insure a ressonable obance of preservation. This paper ie prepared from a pulp consisting of vegetable fiber, asbestoe, alum and borax, in the following proportions: Vegetable fiber, one part; asbeetos, two parte; borax, one-teuth part; and slnm, two-tenths of a part. The vegetable fihere are minutely divided, and treated in the manner usnal in the prodnction of ordinary paper; the aebestos is also divided as much as possible, and the two are then intimately mixed with the alum end borax in a sufficient qnantity of water to make a pulp of the reqnisite oonsistency, which is then made into paper by any of the usnsl processes. The proportions given above may, of course, be varied according to the quality and nature of the deeired product. In eome cases, also, silicate of eoda may be used, in order to insure hardness and coherence in the substance of the paper after it has been acted upon by a fire. If the sheete be made of linen or othsr woven fabric, and coated on both eidee with the incombnstible paper, great strength and flexibility are obtained.

Improven Engraving Prooess.—Some novel and interesting facts, oheerved by M. Gourdon, in the action of acide upon zinc covered with certain metals, have been commnnicated by him to the French Academy of Sciences. Zinc plunged into dilute solutions of eulphnric, hydrochloric and acetio acide, ie attacked only at the points where other metale are preeent, the metels which prodnce thia phenomenon with most intensity being cobalt, platinum, nickel and iron. Now, ammoniacal chloride of cobslt renders it possible to perforate zino with water contsining only one ten-thousandth part of eulphuric acid; and M. Gourdou applies these results, in a very iugenioua manner, to various proceduree for engraving. He states that, by writing upon zinc with different metallic inks, making nee of the most active, containing salts of cobalt, for the blackest parte, and passing it then into acidulated water, an engraved plate is obtained. To reprodnce leaves or plants, they are soaked in eolntions of metallic salte, and applied to the zinc, which is then treated with weak acid. M. Gourdon hse also discovered a new kind of heliographic engraving by transferring the eilver from an ordinary photographic proof npon the zinc, which can be attacked by the acids in the parts where the eilver has been deposited—a discovery evidently eusceptible, when fully developed, of interesting reeults.

The Largest Mauine Enoine in the World. The *Messager de Cronstadt* says thst on the 30th nlt. the engines of the new armor-plated double tnrret-ehip "Pierre le Grand" were tried in the basin at Cronstadt. This colossal engine ie of 1,400 horee-power nominal, and ie the moet powerfnl that has yet been placed in an armor-plated ship, 1,350 horse nominal being the power of the enginee in the English ehipe "Minotaur," "Northumberland" and "Agincourt." The enginee worked from the first moment admirably, and were kept going for eight houre without any necessity arising for etopping them.

Darmouth Mine.

Thie mine hae been apparently to outsidere idle eince last July. The mill hss been standstill since that date, not for the lack of material for it, hut for want of water. We fonnd, on viciting the mine the other day, that Capt. Miller, the euperintendent, has not been idle during the summer snd fall, but hae driven a bedrock tunnel a distance of about 300 feet, hss conetructed, beeide, about 400 feet of open ditch, 10 feet deep, hae put down a large, plank drain flume, and refitted the ditch to its former level. The object of all this work being to abandon an old circuitone tunnel that he feared might prove treacherous when most needed during the winter. Henoe the precautionary step. This work mskea the drainage of the Darmouth complete and safe, through a continuous drain tnnnel of 1,200 feet, liberating the mine from all water contingencies growing out of Alta hill. The company have also enlarged and newly timbered their ehaft, eo ae to be able to uee a cage hereafter, instead of buckets as heretofore. Thie change will enable them to raise three timos the quantity of material that they did with buckets. A new boiler has been eet up in the place of the old one. We find also that Capt. Miller has sunk a prospect shaft, 70 feet deep, in bedrock, directly under the bluff, and from the bottom of the shaft is running a drift into the hill, with the view of cutting and teeting a quartz ledge which is known to exiet in the Darmouth ground. The mine will become, therefore, a well developed quartz mine as well as a number one gravel mine. The prospects for such a result are good. Captain Miller, the superintendent of the Darmouth, directs the affairs of the company here with all energy, and we think in the proper manner to achieve good reeulte. We wieh the town had more active proepectors like him.—*Grass Valley Union.*

A New Quartz Crusher.—We were ehown yesterday a model of Cowlee & Johnson's new quartz crusher, for which its inventore and proprietors claim great superiority over all other mills in nee. It consists merely of a lsrge wheel or drnm, twelve feet in diameter aud eighteen inchee face, to weigh twenty tons, revolving in a hed or trough a trifle wider than the face of the wheel, made of eegments of the hardest iron. This wheel is revolved by gearing placed near its outer circumference, worked by steam or other power. It is calculated that the weight of thie wheel (twenty tone) rolling over any ordiasry rock will crnsh it, at once, fine enough for amalgamating purposes, or at leaet ae fine ae it usually comes from the stamps of the common etamp mill. We need hardly say that if this mill will do what ie claimed for it, it will revolutionize quartz miniug entirely. The comparative coet will be about one-tenth that of the stamp-mills now in use for the eame capacity in tone. One of these mille is now in course of conetruction in this city at the foundry of Wm. Guttenberger, on the corner of Front and N streets, to be completed in about five weeke, when its proprietors expect to demonstrate its practicability.—*Sacramento Record.*

The gold-bearing quartz of Nova Scotia ie moetly undistinguishable in color, structure, general appearance, or associated minerals—which are chiefly galena, blende, arsenical copper and magnetic pyritee—from the qusrtz of other gold regions, except, perhaps, that it is richer in vieible gold. One species of dark-grey laminated, exceptionally rich quartz, occurring only in veins of six inches and under, doee appear to be peculiar to the province, ae it has not yet been matched from any other country. The director of the Geological Snrvey of Canada etatea that "it ie now generally admitted auriferous quartz veins present no features which wonld serve to distinguish them from any other claes of ore lode, either in their origin or in their mode of occurrence;" and on theee grounds he hae long held the opinion, that there is no *a priori* reason why ench veins shonld not contain gold in sufficient quantity to be profitably extracted at any depth to which ordinary mining operatione can be carried.

Coal Fielns of Spain.—M. Grand, in deecribing the coal fields of Spain to the Paris Society of Engineere, eetimated their area at 150,000 hectares (the hectare being abont 1·47 aoree), from which only 500,000 or 600,000 tons are annually extracted, while Belgium, with the eame area, yields 10,000,000 tone. The Spanish cosl fields are situated in Castile, Leon and Asturias. The processes are described as being very rough and imperfect. M. Delesse etated that the coal of the Asturias wae chiefly nsed for gas making.

Montana Mines.—The Helena *Independent* says: The amonnt of quartz sold in Helena during the past eix months has placed over $150,000 in circulation. It is thought that the amount will reach hslf a million next year. There is no longer any excuse for minere being idle in winter. They eell in this market all the ore that they can tske out, or if they prefer to do so, get advances on all they choose to ship. We predict that hundreds of lodee will be worked the coming winter and tho number increaeed each enceeeding year.

Russian Navy.—The Russian anthoritiee having decided upon abolishing wooden ships from their navy and eubstituting iron ships in their etead, have disposed of the whole of the former, and the laet of their once celebrated frigatee hae been eold to Messrs. Wilson, M'Lay & Co., of London and Glasgow, who are dismanting her at St. Peterebnrg.

The Mining Academy of Frieberg.

Thie institntion ie famed, eaye a sporting correspondent of the *Field*, and justly eo, all over the world. Studente of every nationality are fonnd here, and there is no donbt that if a msn likes to work he can learn a great deal, as eome of the moet celebrated profeseore in Germany are teachere. The only reqnieite for a etudent entering the academy ie that he ehould know a little German. This rule ie not very strictly observed, and any one of ordinary intelligence ought to pick up the requisito smount in a month, or six weeks at the onteide. There are different courece open to the option of the student—such as an assaying course, chemical course, eurveying and mining couree, etc. These are eeoh charged separately for, the fees ranging from £3 to £5 each. The plowpipe course, given by the famons Profeseor Richter, is £6. Foreign students are charged £5 yeerly extra; German etudente are exempt from this tax. Living in Frieberg ie excessively cheap. I pay 33s. a month for a sitting-room, bed-room and bath-room, partly furniehed, with attendance. Theee roome would cost at the very least £1 a week in England. Very good roome can be had for eight thalers, or 24s. a month, furnished, with attendance. Esting would cost about 1s. 2d. for dinner. At preeent I eat with four other friends in a private room, and I psy 1s., or 10 groschens a dinner. Very good beer costs nearly 2d. an imperial pint. Altogether a young fellow can live perfectly well in Freiberg on £10 a month, or on £150, naying lectnre fsoe. The whole course lasts three yeare; but I imagine that a man wonld do far hetter by picking out a few particular lecturee and finishing in 18 months or two yeare. Now, after the course, what return has a man for his money? I unhesitatingly answer that a man who hae worked hard for two years at Frieberg ought to be able to go anywhere in any mining district in the world and command his £500 a year. So many people are troubled with queetione as to what to do with their younger sons, that I am snre that sending them to Freiberg, and giving them a first-clase profeesion in two yeare for £375 or £400, is well worth their consideration. To ench a msn, *i. e.*, one well educated at Frieberg, the whole of the American continent, and indeed moet of the world, is open. Now that England is eo "blocked" it has become a neoessity to go farther afield; and probably mining engineering and ssaaying offer about the very best openings to an enterprising man. Immense deposite of metsl are daily being diecovered in Colorado, and the eouth-western States, while Chili and Peru are short-handed.

Mining in Humboldt.

The mining proepecte in Humboldt never looked better since the "wild cat" daye of '63. Old claims, that have for eeveral years been abandoned as worthlese, are being worked, and, in moet cases, are paying their owners. The Pride of the Monntain, in Winnemncca district, ehows a good vein of rich ore, and the owners are making it pay them a good profit. The Pride of the World, aleo, hae an excellent proepect. In Sierra district, Twies & Co. are egain teking ore from their mine, and believe they are through the elide. There are otner claims in this district ehowing eome good ore. The Tullulah company are eoon to resume work on their mine. At Unionville, the Million dire, owned by O. K. Stampley & Co., ie developing into a eplendid mine. The vein has laid nearly flat, but has now become nearly upright, and ie pitching down the hill, eo that a short drift will reach it from the enrface. The rock ie from eighteen inchee to two feet thick, and the boye are eacking every pound of it. There eeems to be no resson why this mine ehonld not make the fortnne of its owners, if energetically msnaged. The Arizona ie nnder a cloud just now; not much ore coming ont, and what there is being difficult to work. The Eagle mine, at Spring Valley, improves every day. We learn that the lode is 12 ft. wide at the croee-cut, near the bottom of the winze, that is down 90 ft. The lode has 5 ft. of ore that aeeaye over $65 per ton, and ia pure milling ore. Samplee of the pooreet rock in the mine, worked by mill procese, in San Francisco, yield $18 per ton. The company's new fifteen-stamp mill will be at work in about two weeke. Claime on the esme lode, to the north and south of the Eagle company'a gronnd, are being worked snd show fine proepects. From Golconda, Paradise and Bartlett oreek we have encouraging news. The mining intereste of Hnmboldt are looking up, and all we want ie capital, to make this one of the first bullion producing conntries of the State.—*Register.*

Australian Mining Statistics.—For the quarter ending 30th of June last: Central division of tho Ballarat mining district.—Alluvial miners: 1,621 Europeans, 275 Chinese; quartz miners: 802 Europeane; total, 2,698. Total quantity of gold, 16,358 oz. 2 dwt. 7 gr.; alluvial, 10,237 oz. 7 dwt. 13 gr.; quartz, 6,120 oz. 14 dwt. 18 gr. Total nnnnber of steam engines, 119—3,945 horse power. Total value of plant, £418,230. Average price of gold, £4 2s. 9d. per oz. Tons crnshed, 21,957; average per ton, 5 dwt. 13·69 gr.; previous quarter, 5 dwt. 20·10 gr.

Austin Bullion.—Wells, Fargo & Co. ehipped from Anstin for the month ending October 31st, 1874, for acconnt of Manhattan S. M. Co., 57 bare of bullion, weighing 5,838 pounds, and valued at $72,800.

Good Health.

One Hundred Years.

HOW TO ARRIVE AT THAT AGE.

It has been said that the human frame, as a machine, is perfect; that it bears no mark within it by which we could predict its decay; that it is apparently calculated to go on forever, and that only by experience have we learned that it will not do so. A French writer has tersely remarked that, nenally, men do not die—they kill themselves. There is a great deal of truth in the latter, and there is a great deal of encouragement in the former saying. That our organism is so perfect that the seeds of decay are not observable within it, affords ground for hope that man may add to the average number of his years. And this is rendered all the more probable as it is well established that the average of human life is longer by a very considerable fraction than it was a century ago.

An English physician has lately published a work on the means of prolonging life after middle ago. In common with a great many of his profession, Mr. Gardner, the physician referred to, seems to believe in the possibility of man's adding to his years. Flourens has formulated the law of natural organic life, and claimed that it is capable of extension to five times the period of growth. Assuming this law to be true, man's natural years should be from 90 to 105 years. Dr. Gardner seems to have fully coincided with Flourens. Reasoning from the analogy of anesthetics, he sees no cause to despair of the discovery ultimately of a genuine *elixir vitæ*. Meanwhile he would prolong the reign of youth by tranquility of mind, sobriety and uniform temperature. He would have no one fret or worry.

Dr. Duncan Gibbs, who has written a work on the physical condition of centenarians, and who had personally examined six persons over 100 years of age, confirms Dr. Gardner's views, in this latter respect at least. In all six, Dr. Gibbs found the lung perfectly whole, also the heart. All six had good "bellows-power," as evidenced by the firmness, sonorousness and clearness of the voice. In each the cartilage at the top of the wind-pipe was in a vertical position. The skin was in each case tough and silvery. There was no case of enlarged or fatty heart. The digestion was perfect, and so was the calmness of mind. The bodily senses and mental faculties were unimpaired. Drs. Gardner and Gibbs agreed that climate was unimportant as regards longevity. When bordering on old age, the advice given is to stay at home, to keep warm, to have pleasant occupation, to take proper exercise and diet, to avoid starch of potato, malt liquor and cheese. Dr. Gardner would not undertake to lay down rules by observing which each one could make himself a centenarian. The task is an impossible one; and yet his advice is not wholly to be disregarded. It may if scrupulously followed out make centenarians of us all, which perhaps would be a great misfortune for the world; but it will be calculated to make sexagenarians of those who might have died in their thirties or forties.

If a man would add to his years let him take care of his lungs by properly exercising them, of his heart by avoiding all undue excitement, of his brain by cultivating tranquility. Let him be temperate and pay a proper regard to the cleanliness and temperature of his person, and he will have done more for himself than a doctor and the whole pharmacopœia can do. If he will do all this, some future Dr. Gibbs may find him, at the age of hundred or thereabouts, with lungs and heart perfectly whole, with good "bellows-power," a firm, clear and sonorous voice, with tough and silvery skin, and the cartilage at the top of his wind-pipe in a vertical position, and with his senses and his faculties as keen as those of a man in his prime—with his children and his children's children around him. Virtue is the basis of longevity, as of individual prosperity and national greatness.—*Chicago Tribune.*

SORE THROAT—TIGHT COLLARS.—Says an exchange: An eminent physician, who devotes his whole attention to diseases of the throat and lungs, told us the other day that about three fourths of all throat diseases would get well by wearing very loose collars, and no necktie at all. He said that often singers came to him for throat diseases and loss of voice, and he would tear open their cravats and cure them, with no other treatment whatever. "The pressure of the collar on the arteries of the neck is very bad for the health," said he. He also added: "If you have a disease of the throat, let nature do the curing, and the physician as little as possible."

HAIR OIL.—Are hair oils good things to put on the hair? No! Some of them are poisonous, and others filthy. The *Laboratory* says: "Many hair oils are colored with aniline red, instead of the long used anchusa, which answers every purpose, and should be continued. A hair dresser had been accustomed to use hair oil composed of castor oil, colored with aniline red. A patron, whose head had been dressed with with this oil several times, became aware of a disagreeable itching in the scalp, similar to that produced by arsenic. Inquiry traced the presence of arsenic in this aniline coloring, and by a discontinuance of the oil the eruption disappeared."

RAW FRUIT.—Does fruit agree better with the stomach cooked rather than raw? A writer in an English paper says: "An almost universal prejudice prevails against the free use of uncooked fruit. It is looked upon as very unwholesome. The prejudice is easily accounted for. Suppose any one eats a good dinner, and forthwith sits down to a second, the second dinner would assuredly disagree with the first. This is exactly what has happened in the case of fruit. Ladies and gentlemen dine freely off a great variety of food, and many afterward eat sufficient fruit as dessert to have sufficed for a temperate meal. The result is discomfort or deranged function, followed by an outcry against the use of fruit. But supposing the fruit to have been eaten as, instead of after, a meal no such consequences would have followed. A moderate quantity of apples, pears, plums, cherries, grapes, with a slice or two of bread, form a cheap, pleasant, wholesome and satisfying meal. Without entering into their chemical composition, it may also be affirmed that fruits are tolerably nutritious, and as an alterative they are exceptionally wholesome. Of course there are those with whom raw fruits disagree, just as there are many who are unable to eat pork or veal. But these can have their fruit cooked. Stewed pears, apple pies and puddings, plum or currant tarts, with plenty of bread, would furnish a dinner fit for a king, without the preliminary of meat, fish, etc. In fact it is the mixture that proves injurious. Few fruits if eaten alone disagree with healthy stomachs. Only bread and light cake should be eaten with them. The food of a large portion of mankind, broadly stated, is bread or rice, which is almost the same thing, and fruit."

OVERWORKING THE BRAIN.—Softening of the brain is becoming a more common disease than formerly; as it is utterly incurable, attention should be given to its causes. The softening is caused by an inflammatory condition or a gradual degeneration of the substance of the brain, arising from intense mental excitement, as a result of study, of the use of spirituous liquors, or allowing the mind to dwell upon one subject unpleasantly, especially when there is no real cause, or conjectured injuries, or injustices and the like, moping over them, cherishing thoughts of them. This lamentable malady comes on at one time with a sudden head or ear ache, at another with difficulty of speech, or numbness, or convulsions, or paralysis, or actual insensibility; or at other times there is simply a decline of the power of the senses, sight, hearing, speech, and the mental powers generally. The same disease is caused by want of something to do, when there is no compulsion to mental effort or muscular exertion. To ameliorate a malady arising from causes so diametrically opposite, antipodal means should be employed—less work to the over-worked, more work for those who have nothing to do.—*Hall's Family Doctor.*

PLAIN DIET BEST.—It is possible to satisfy all the demands of nature at a very small cost. In many parts of the continent the average wages of the laboring classes, taking the year throughout, is not more than fivepence a day, or half a crown per week; yet these classes are on the whole healthy and robust, although meanly clad. It has been proved over and over again that healthy life can be maintained on cheap and plain food, and that the longest livers and surest workers are those habituated to plain diet. The Scotch are a notable instance of this; a hardier, stronger, more enduring race probably is not to be found; and the staple of the Scotch peasant's food is oatmeal, the cheapest as it is the most nourishing of grains. "A Highlander," says Findley, "will traverse the mountains all day upon a diet of oatmeal stirred in fresh water from a gushing spring, with his finger, in a leathern cup." An English navvy who boasts of eating a pound of beefsteak for dinner, would starve on oatmeal and water, while all the beef he could devour, and the beer he could drink, would not enable him to keep up with the Highlander for a single day.—*Leisure Hour.*

THE GRAPE CURE.—What is termed the "Grape cure" has not as yet become very popular in this country, owing probably to the lack of grapes suited to the purpose. In Europe the fruit used is of quite a different character from that of our native varieties. The skin of foreign sorts employed in the grape cures adheres firmly to the flesh and it would be a difficult matter to separate it in eating, but the flesh being brittle and firm it readily breaks open under pressure allowing the seed to drop out if the consumer desires to reject these indigestible pellets. But whether swallowed or not will depend somewhat on the patient's stomach, as well as the disease to be treated. A person consuming from three to ten pounds of grapes daily—which is not considered extravagant at the grape cures—would have to possess the stomach of an ostrich to safely carry the stones from the quantities named. As a rule it is safe to reject the seed, although they are not considered injurious in moderate quantities.

A FRENCHMAN has discovered that a stream of water directed from a force pump against a spot visited by neuralgia will relieve it. The operation is painful, but "patients call for a repetition on a return of the disease."

Useful Information.

Breeze Coke.

A new industry has sprung up in our city in the last year or two that gives employment to quite a number of men, and, at the same time, utilizes one of the waste products of our mills which, heretofore, has been thrown away as useless. The technical name of the article is "Breeze Coke." The ashes from the furnace ash-pits are hauled into one place, and the first thing to do is to separate the larger particles of coke from the finer ashes by the use of a rake. They are then placed in a large tank of water, and all the coke that is fit for use floats on its surface, while the heavy ashes and cinders fall to the bottom. The breeze coke is then taken off the surface, and any light cinder that did not sink, taken out by hand, when the coke is ready for market. It is used principally by blacksmiths, and is the best article known for a forge fire. Messrs. Lewis, Oliver and Philips use 125 bushels a day for their forges, for which they pay five cents per bushel, having furnished the ashes for them free, and allowing the breeze washers to sell all that they do not use for their own profit. Mr. Rodgers, of the firm of Rodgers and Day, informed us that the company shipped a car load a week ago into the state of Ohio, besides furnishing many of our local shops with them, while other firms have shipped three car loads a week. As most of the shops are at present doing but little, the breeze coke business, of course, is not so brisk, yet the three firms that are operating in the city find ready sale for all they can make. Mr. Schultz, the Carson street bridge builder, uses a large amount of the coke for his forge fires. The price ranges from 6 to 6¼ cents per bushel.—*Pittsburgh Leader.*

INVISIBLE INK.—If we write with a very dilute solution of chloride of copper, which has scarcely more color than pure water, the characters are invisible; but if gently heated, they become distinctly yellow, and are easily read. Let the paper cool, and they vanish; and they may be made to appear and disappear an indefinite number of times. If heated too strongly, the compound is decomposed, and the writing becomes permanently brown from the deposition of the copper. The chloride of copper may be conveniently made by mixing solutions of sal ammoniac and blue vitriol. The change of color in this and kindred cases is due to the removal of the water of crystallization by the heat. In chemical combination with the water, the salt is transparent; without the water, it is opaque. The salt, being very deliquescent, rapidly absorbs moisture from the air when cool.—*Boston Jour. of Chem.*

HOW TO FASTEN RUBBER TO WOOD OR METAL.—As rubber plates and rings are now-a-days used almost exclusively for connections between steam and other pipes and apparatus, much annoyance is often experienced by the impossibility or imperfection of an air-tight connection. This is obviated entirely by employing a cement which fastens alike well to the rubber and to the metal or wood. Such cement is prepared by a solution of shellac in ammonia. This is best made by soaking pulverized gum shellac in ten times its weight in strong ammonia, when a slimy mass is obtained, which in three to four weeks will become liquid without the use of hot water. This softens the rubber, and becomes, after volatilization of the ammonia, hard and impermeable to gases and fluids.—*American Artizan.*

PETROLEUM PRESERVATIVE.—We do not think that the value of crude petroleum as a preservative of wood is properly appreciated, especially among farmers. Even for implements, fences and buildings which are to be painted, it is a good plan to give one or two coats of petroleum first. It is very often the case that when the first coat of paint is placed directly on the wood that it is injured by the too rapid absorption of the oil by the dry wood. One or two coats of petroleum will prevent this, and save both oil and paint. For fork and shovel handles nothing can be better.

BRONZING WOOD.—Saturate the article first with hot parchment glue, previously filtered and not too weak; and when dry, coat white slightly warm, with red ochre mixed with a little yellow, and when perfectly dry coat a second time. Then rub the whole carefully with moistened shave grass and apply, with a brittle brush the bronze, of copper and brass or tin, mixed with alcohol. The article, as well as the bronze must be kept warm during the operation, either in the sun or near a fire. Two or three coats are necessary to produce a perfect effect.

RENOVATING BUGGY TOPS.—Enamel leather tops which have become hard, but have not lost their color, can be softened and much improved in appearance by oiling them with pure castor-oil. This oil is readily absorbed by the leather, and will not fry out in the sun. When the leather has turned gray, apply a coat of hatters' blacking, after the oil has struck in, and rub well with a cloth to bring out the polish. Most varnishes dry too hard to be used on tops, shellac varnish being the only kind that can be used with safety, but this will crack unless the coat be applied very thin.

Domestic Economy.

Tasteful House Furnishing.

The following, which we clip from an old number of Blackwood, may not be counted strictly as household "economy." In our time and place and with our actual ideas and actual wants, such rooms as are described below may be considered typical; they represent the highest form of realization of modern taste without its faults, or rather with as little of them as is consistent with the expenditure of any given amount of money and thought:

The Dining Room.

In the dining room there is an atmosphere which we do not often breathe elsewhere. All is dark brown cloth and ebony; but the weakened daylight which struggles in through the heavy curtains finds resting places, and marks points on the angles of the old *faience* which stands upon the dresser, on the steel hinges of the sideboards, which flicker vaguely on the yellow and dull blue of the hanging lamp. Brown walls set in black beading frame in the room, and lend its aid to its austere but grand effect.

The Drawing Room.

The drawing rooms are painted in a tint which the catalogues of color do not define—something between a fading China rose and half-ripe Indian corn. Narrow banks of faint pearl grey enrrounded each panel, and here and there a thin line of gold relieves the gentleness of tone. Chairs of varied shapes, all made for comfort and suited to the position which each sitter may wish to take, stand about in pleasant irregularity. They are clothed in different stuffs of all the finer sorts, so that the varying sheen of damask, silk and satin may prevent the uniformity of one material; they are embroidered with fantastic flowers of every hue, but calculated so that each shall mingle with and neutralize the other, the object being to subordinate each part to the whole effect. As the French say, "nothing screams," for all fits well together.

And plants with variegated leaves, and books whose very binding has been calculated for the place it is to occupy, and the thousand trifles which lie about, and the work basket from which skeins of wool are cunningly allowed to overflow, because their colors will serve a purpose, and the laced handkerchief left trailing there in the angle of a sofa, in order to light up by its whiteness a too dark corner—all these things show thought; all are contrived with skill and art, with the one object of creating a thoroughly charming room, where the mistress asserts herself in her own handiwork.

The Bed Room.

Now go to the bedroom, and from the doorway observe it with your eyes, for never have you seen a picture so complete. The walls, the hangings, and the seats, are all in pale blue satin, edged sparingly with velvet of the same shade, and embroidered daintily with pale moss rose buds, swathed in still paler yellow leaves. But this description, though exact, gives no idea of the effect produced by that woudrous tissue, of the incredible effect of delicacy and thorough feminine elegence which it sheds around. The room is filled with a vague floating perfume of charm and grace; its every detail is combined to aid and sustain the almost fairy aspect it presents. The bed is shrouded in thickly wadded satin curtains, inside of which hang others made of muslin so vaporously filmy that its folds seem almost mist; the coverlet which hides the lace trimmed sheets and pillows, is in blue satin, lined with eider down, and covered with the same veil of floating white hanging down in a deep flounce over the wood work of the bed. The toilet table is the same—a nestling mass of transparency and lace, with blue beneath; and knots and streamers of mingled satin and velvet round. On the chimney piece stands a clock and candlesticks of Sevres china. The piano is in pale *boise de rose*, (not rose-wood, which is a very different thing) inlaid with plates of Sevres to match. At night light comes from above, where hangs a lamp of Sevrea again.

GRUEL.—We give the following from the *Health Reformer* concerning what seems a very simple matter—the making of gruel. It is important that every woman should know the best way of preparing that which is both food and medicine for the sick: "Several articles may be used, but wheat-meal is preferable. Have the water boiling. Make a paste of the meal and cold water, and stir it slowly. It must not stop boiling for a moment; if it does it will have a raw taste, which you cannot remedy by cooking for hours."

POTATO PUDDING.—With a pound and a quarter of mealy potatoes boiled very dry and mashed perfectly smooth while hot, mix three ounces of butter, five eggs, a few grains of salt and the grated rind of a lemon. Pour the mixture into a well buttered dish, and bake in a moderate oven three-quarters of an hour. When done sift some sugar in it.

WASHING WINDOWS.—In washing windows or other glass, never use soap, unless it can be thoroughly rinsed off; wash off the dirt in clean warm water; after the glass is dry, rub with a little paste or whiting and water, in the center of each pane. With another cloth rinse over the glass, then rub it with a dry cloth till it shines like crystal.

Saturday Morning, Nov. 14, 1874.

TABLE OF CONTENTS.

EDITORIALS AND GENERAL NEWS.—Measurement and Yield of Gravel; Damage by a Typhoon; Placer Mines, 305. Profits of Drift Mining; Hammers, 312. An Extension of the "Sphere;" The New Mint; Territorial Pioneers; The Passenger Pigeon, 313. Increase of Population; Large Bunches of Grapes; Hay for Fuel; More Land for the Market; A Terrible Tragedy; Holding Back Grain; The Three Brothers; Land Suit; The Young Prince Napoleon Betrothed; The Palace Hotel; Rye for Hay; Patents and Inventions, 316.

ILLUSTRATIONS.—Placer Mining, 305. Passenger Pigeon, 313.

MECHANICAL PROGRESS.—Tempering Steel; Wood-Sawing by White Hot Wire; Transformation of Sandstone to Marble; Steel Armor for Land Fortifications; Steel vs. Iron Plates; Gatling Guns for Sea Service; A Safety Car Stove; New Method of Simultaneous Lamp Lighting; A Model and Experimental Flour Mill; A Mammoth Cannon; Improvements in Cast Iron; New Box-Making Machine; An Expensive Road, 307.

SCIENTIFIC PROGRESS.—A New Mineral—"Rivotite;" The Ocean's Floor; The Spectroscope; A Colorimetric Test for Gold in Quartz; Extraordinary Reflection; Elastic Reaction by Torsion; Variations of Liquid Substances; Interesting and Pretty Experiment; Protecting Influence of the Earth's Atmosphere; Discovery at Herculaneum, 307.

MINING STOCK MARKET.—Thursday's Sales at the San Francisco Stock Board; Notices of Assessments; Meetings and Dividends; Review of Stock Market for the Week, 308.

MINING SUMMARY from various counties in California and Nevada, 308-9.

GOOD HEALTH.—One Hundred Years; Sore Throat—Tight Collars; Hair Oil; Raw Fruit; Overworking the Brain; Plain Diet Best; The Grape Cure, 311.

USEFUL INFORMATION.—Breeze Coke; Invisible Ink; How to Fasten Rubber to Wood or Metal; Petroleum Preservative; Bronzing Wood; Renovating Boggy Tops, 311.

DOMESTIC ECONOMY.—Tasteful House Furnishing; Gruel; Potato Pudding; Washing Windows, 311.

MISCELLANEOUS.—The Wallapai Mines; Calaveras County Mines; Copper Ores; Hoisting Works Improvements; Wyoming Mine; A New Theory of Electricity; New Mining Enterprise; Tyho District; A New Fossil Mammoth; To Restore Burnt Pick Points; Mechanical Puddling, 306. Refining Metals; New Concentrating Works; Incombustible Paper; Improved Engraving Process; The Largest Marine Engine in the World; Dartmouth Mine; A New Quartz Crusher; Coal Fields of Spain; Montana Mines; Russian Navy; The Mining Academy of Freiberg; Mining in Humboldt; Australian Mining Statistics; Austin Bullion, 310. The New Vegetable Market of San Francisco; Rich Quartz in Eureka Township, 314.

Mining Accidents.

A man named Horgan, better known as "Cap Johnson," was killed at the Sierra Buttes mine last week. Another man had his foot crushed and still another lost the first joint of his fingers at this mine, all in the same week.

At the Soulsby mine, Tuolumne county, a water bucket fell on a man in the winze, injuring him severely.

On the 5th inst., W. H. Faust, in the Consolidated Virginia mine, on the Comstock, was severely injured by falling down a chute.

Thomas Molton was on the same day severely injured by a blast in the Belcher mine. He was passing by a drift as the blast went off.

James Jenkins was badly injured by a cave in the Consolidated Virginia mine on the 5th inst., by a mass of earth falling upon him, breaking his leg and otherwise injuring him.

William Upham, another of the men who were caught in the blazing drift on the occasion of the late fire in the Belcher air shaft, died last week.

THE various coal mines above Nanaimo are doing well, judging from the amount of coal which they are turning out. Dunsmuir's mine and the Victoria coal company's mine are taking out about 140 tons per day.

IT is estimated that 1,000 men are employed in working and prospecting in and about Pina Flat, Sonoma county.

Profits of Drift Mining.

One of the peculiar and interesting features of the mining interest of Sierra county is its "drift claims." This class of mines consists of locations in the ancient river beds covered by the great volcanic outpouring which succeeded the pliocana period. The system of work pursued is by means of tunnels, generally run through the side or "rim rock," at sufficient depth to tap the channal. The main tunnel is carried on "up stream," and "gangways" are run toward either bank, the gravel being run out by cars and washed by sluice boxes, and the worked out ground being allowed to cave and fill up as the main tunnel, which is secretly protected by timbers, progresses. The depth of gravel which it is found will pay by this system, is from three to five feet, including from three to six inches of bed-rock, which is picked down and washed with the gravel. The lower stratum, including the bedrock, is invariably the richest. This branch of mining, formerly pursued with great success in various portions of Sierra county, had of late years fallen into decadence, until it was revived in 1872 and 1873 by the remarkable results following the opening of the Bald Mountain claim, at Forest City. Prior to the development of this mine in 1872, Forest City, once a lively and prosperous town, had degenerated into an almost abandoned mining camp. Houses and lots were to be had for the payment of taxes, and in one instance a well furnished house sold for $75. The results of the first clean-up of the Bald Mountain claim, however, changed, for a time at least, the destinies of the town, and now it has resumed all its former prosperity and given a strong impetus to surrounding camps.

Mr. W. A. Skidmore, depnty for R. W. Raymond, U. S. Commissioner of Mining Statistics, has recently visited Sierra county and prepared a very elaborate statement for the next annual raport of the Mining Commissioner. He has given us the liberty of making extracts from this, which we take pleasure in publishing. At Forest City the principal claim up to the period of the development of the "Bald Mountain" company's ground, was the "Live Yankee." The "Live Yankee" owns 2,600 feet in length on the channel, most of which is now worked out. This ground yielded during the nine years in which active mining was carried on (from 1855 to 1863 inclusive) the sum of $698,534, of which $370,106 was expended in opening up the claim, etc., and the dividends disbursed were $328,368. For several years thereafter and until the ultimate exhaustion of the company's ground, the dividends averaged $10,000 per annum. For a period of seven consecutive years after the opening of the mine, and preceding the symptoms of exhaustion, the dividends averaged $49,191 per annum. The total product of the ground may be safely estimated from the date of opening the mine to the suspension of operations, at not less than $1,000,000, of which probably one-half was disbursed as dividends; and this was during a period of high-priced labor, and in the pioneer days of drift mining.

About the time of the decline of prosperity of the Live Yankee (1867-68) Mr. M. Redding, a practical miner of Forest City, who had worked in the Live Yankee, observing an easterly trend of channel in that ground, formed the opinion that the main channel of the "Blue Lead" diverged from its N and S course and passed in a N. E. direction toward and under a high mountain capped with basaltic lava, lying east of Forest Hill. Acting on this theory he acquired by location and purchase the present ground of the Bald Mountain company. Finally, being unsuccessful in getting capitalists to invest, after much perseverance and the display of remarkable tenacity of purpose, he succeeded in forming a company consisting of practical men whose only capital was their labor, and vigorous operations were commenced in the fall of 1869. A shaft was sunk at a point considerably east of what was popularly considered the course of the blue lead. The blue colored pay stratum was reached at 260 feet in depth, and bed rock at 269 feet. By strange fatality the particular portion of the channel tapped by this shaft was in the poorest ground in the mine, and some of the owners parted with their interests at a loss. Had the shaft been sunk 10 feet in any direction from its position, it would infallibly, as proven by subsequent developments, have struck gravel of remarkable richness. In fact a 40-ounce nugget found in the company's boxes in 1873 is supposed to have come from this portion of the ground.

Mr. Redding and his associates, however, were satisfied with the gravel, and determined on running a tunnel to connect with the shaft and open the ground. This tunnel was commenced in June, 1870, and prosecuted with periods of interruption to its completion in April, 1872, a period of twenty-two months. The distance was 1,800 feet. The work was accomplished by manual labor, single-hand drills and Giant Powder, and cost, including the prospect shaft, about $20,000—being $1,000 to each original interest. This represents the outlay of the company on their mining venture. No further assessments were levied, but something over $200,000 in dividends have been disbursed between April, 1872, and January 1st, 1873. Mr. Skidmore has obtained a tabulated statement from the company, of the receipts and disbursements at the claim, from which we make some extracts. The total yield from July 1st, 1872, to July 1st, 1874, amounted to $328,352 38. The dividends during the same time were $164,000. From July 1st, 1872, they had extracted 115,950 carloads of gravel, which paid $2.76 per carload, or $1.09 per square foot. They worked altogether in this time 292,200 square feet. The per-centage of dividends to the gross amount taken out was 50 per cent. They estimate that there are 7,232,000 superficial feet contained in their claim, which if it pays as it has done, $1.09 per foot, will yield $7,882,880. We may state here that the claim is not for sale.

The first clean-up consisting of dirt taken from the tunnel yielded only $132. From this time the returns steadily increased, in July of the same year amounting to $1,000. This gradually increased until with progressing development the present remarkable yield was reached, and attention thereby called to this long-neglected branch of mining. On April 25th, 1874, two years after the first modest return of $132, the result of the clean-up was $13,733.24, and one week after (May 1st), $14,694.76. As will be seen by the foregoing statement the total yield up to July 1st, 1874, was $328,352.38. From July 1st to Sept. 30th, 1874, there was taken out only $16,726.84. This was owing to a scarcity of water—the dirt being allowed to accumulate in the yards. The actual bullion product therefore at the time of Mr. Skidmore's visit in October, 1874, had been $345,079.22 from a piece of ground about 1,000 feet long by 500 wide, exclusive of the unworked ground within this area, and not including the value of the gravel piles in the company's yards.

The term "drifting," as applied to the class of operations pursued at this mine, relates to the mode of extracting the auriferous gravel by means of tunnels and gangways, or galleries; and washing dirt in sluices. This system is rendered necessary in consequence of the capping of volcanic matter overlying the ancient channels, and rendering hydraulic operations impossible. In hydraulic mining the entire face of the bank is removed by the pipe; in drifting claims only the lower stratum of gravel lying on the bed rock is mined and washed. The average depth of pay gravel when mined in this manner is about three feet.

The gravel in this channel is exceptionally rich. Mr. Skidmore informs us that the Bald Mountain claim is one of the best managed gravel claims in the State, being a model in this respect. The Superintendent is Mr. H. Wallis, an intelligent, practical miner. The pay roll of the Bald Mountain company generally contains from 90 to 100 names. Of these 85 are miners, receiving $3 per day. Thirty cars are employed in running out the gravel, which is dumped in the yard, at the mouth of the tunnel, and thence into the flume. This flume is 6,600 feet long, 17 inches wide, and 18 inches high, paved with blocks 16x16, and four inches thick. The gold, being as a general thing coarse, settles in the interstices of the blocks. No quicksilver is used in this class of mining. The usual head of water of the company is from 100 to 150 inches. The flume is cleaned up in sections, about twice a month, and a general clean up is made twice a year, when the worn out blocks are turned over or replaced. A set of blocks will last about ten months; but during this time they are turned over. The company own one mile of the bed of Oregon creek, below the end of the flume. The flume is built on a grade of six inches to 12 feet, equivalent to a fall of 225 feet for the entire distance of a mile and a quarter. The main tunnel is six feet three inches on the bottom by three feet eight inches on top and six feet in hight. The cars are four and a-half feet long, two feet wide, and two and a-half feet high, containing one cubic yard of loose dirt, which is equal to about half a yard of ground in place. Therefore, the result of $2.76 per car load by this company from April, 1872, to July, 1874, would be equivalent to $5.52 per cubic yard of standing ground.

In the same vicinity of this claim, Messrs. Hanlay, Crane & Co. are running a bed-rock tunnel, using a Burleigh drill and air compressor. North of Bald Mountain the Ruby company, a San Francisco company, Captain Wm. Irelan, Superintendent, are engaged in mining a bed-rock tunnel also.

PROFESSOR HILGARD ACCEPTS.—We are happy to announce that Prof. Hilgard has accepted the professorship of agriculture in the University of California. The State generally, and our great agricultural interests in particular, are to be congratulated on securing the services of one whose record gives assurance of competent ability to fill the high position which has been tendered him, and that he is an earnest practical worker, as well as a thorough scientist.

THE Consolidated Virginia mine extracted 1,584 tons of ore for the week ending Nov. 7th. Of this 1,713 tons were sent to the mill, and 756 tons remained in the ore houses. On the 7th inst. 59 bars of bullion were shipped from the mine, valued at $192,378.91.

DRIFTING has commenced on the bar at the entrance of Wilmington bay, although the work is progressing slowly.

Hammers.

Few people in using a simple hand hammer ever think of it as an engine giving out tons of force, concentrating and applying power by functions which, if performed by other mechanism, would involve trains of gearing, levers or screws; and that such machanism, if employed instead of hammers, must lack that important function of applying force in any direction tha will may direct. The general characteristic of all forging machinery is that of a great force acting through a short distance. The conditions of short range and great force are best attained by what can be called percussion machines, which act by blows instead of gradual pressure; and hence we find that hand and power hammers are the most common tools of a smith's shop. A hammer head may by its momentum give a blow equal to a dozen tons, and absorb the reactive force that is equal to the blow; but if an equal force was to be exerted by screws, levers or hydraulic apparatus, a very strong abutment would be required to withstand the reactive force.

This principle is somewhat obscure, and the nature of percussion forces not generally considered. Mr. J. Richards, of London, who is writing a series of articles on the principles of shop manipulation, for engineer apprentices, in *Engineering*, directs attention to percussive agents generally, and illustrates his subject by investigating the action of a simple hand hammer. He says that a simple hand hammer is in the abstract one of the most intricate of machanical agants; that is, its action is more difficult to analyse than that of many complex machines involving trains of machanism; but our familiarity with hammers makes us overlook this fact, and they have even been denied a place among those mechanical contrivances to which there has been applied the mistaken name of machanical powers.

Let the reader compare a hammer with a wheel or axle, inclined plane, screw, or lever, as an agent for concentrating and applying power, noting the principles of its action first, and then considering its universal use, and he will conclude that if there is a mechanical device that comprehends distinct principles, that device is a common hammer. It seems, indeed, to be one of those things provided to meet a human necessity, and without which mechanical industry could not be carried on. In manipulation of nearly every kind the hammer is continually necessary, in order to exert a force beyond what the hands may do unaided by mechanism to multiply their force. A carpenter in driving a spike requires a force of from one to two tons; a blacksmith requires a force of from five pounds to five tons to meet the requirements of his work; a stonemason applies a force of from one hundred to one thousand pounds in driving the edge of his tools; chipping, calking—in fact nearly all mechanical operations consist more or less in blows, and blows are but the application of accumulated force, expanded through a limited distance. As a mechanical agent a hammer concentrates the power of the arms, and applies it in a manner that meets the requirements of different kinds of work. If great force is required a long swing and slow blows accomplish tons; if but little force is required, a short swing and rapid blows will serve; the degree of force being not only continually at control, but the direction at which it is applied also. Other arrangements, if employed instead of hammers to perform the same duty, would from their nature require to be complicated machines, and act in but one direction or in one plane.

Machines or tools operating by percussive action, although they comprise a numerous class, and are applied in nearly all mechanical operations, have never received the amount of attention in text books that their nature calls for, nor their extensive use warrants. Such machines have not even been set off as a class and treated of separately, although the distinction is quite clear between machines with percussive action and those with what may be termed direct action, both in the manner of operating and in the plans of their construction.

STEVENS BATTERY.—On the 1st inst. the Commission appointed by the Legislature to sell the Stevens battery met at Trenton, N. J. and opened the bids received for this famous war vessel, which has been in construction since 1843 at Hoboken. Ten bids were received, and the bid of the United States Government of $125,000 was accepted, subject to the condition that an appropriation be made by the next Congress for the amount.

MINE SALES.—Advices from Unionville, Nev., state that Stumpley & Co. have sold the Millionaire mine to Hill Beachy. The price is said to be $40,000. Beachy has let a contract for a long tunnel to strike the ledge in a new place. Several sales of mining ground in the vicinity of the Eagle mine have been lately made to Oakland men.

COL. BUELL'S mill at Wallapai mountain, Arizona, is now in successful operation, under the management of Charles Pletz. No doubt, it is but the forerunner of other and larger mills.

IT is stated that an ice making machine, which will turn out ice at a remarkably small cost, will soon be put in operation in this city.

An Extension of the "Sphere."

An item is now going the roande of the press to the effect that four ladies of position in London have become house decorative artists. They undertake the whole furnishing, upholstering, and all that tends to embellish the interior of a dwelling. They are said to be remarkably clever and very successful. They have served a regular apprenticeship, and acquired a thurough knowledge of the business. We do not know why this idea could not be followed with success in other places than London. It certainly opens a new field of employment for women, and one which they are eminently fitted to fill. It is not, however, by any means necessary that they should be "ladies of position," but simply that they should possess what is called good taste. "Ladies of position" only too often lack this quality, and are apt to become "loud" and lavish of display. It is a great mistake to suppose that only people of wealth have good taste, because we see at their residences elegant furniture, paintings, carvings, etc., for this only shows that they have money to purchase the decorations for their houses. Of course possession of wealth is not a proof of lack of taste, since a majority of persons of wealth have had the advantage of a good education, which in itself amounts to a great deal in this direction.

There are plenty of women of cultivated tastes in the middle classes of society, who, with means at command, could embellish dwellings as elegantly as people of higher position. We often see evidences, in humble dwellings, of superior powers of discrimination in the arrangement of furniture, ornaments, etc. Women generally have a more delicate sense of the fitness of things in the interior of dwellings than men do, and are much more competent to attend to the necessary details. In most of our large cities employment of the kind referred to, would be found for a few women who made a business of it. A reputation in this line once acquired would be worth a fortune to the possessor. Naturally the wealthy classes would be the customers, and many of this class would be glad to give up the bother and annoyance of fitting up their dwellings, to some one who was competent to superintend the matter.

It often occurs that furniture dealers in large cities are commissioned to select carpets, curtains, furnitare, utensils and everything appertaining to domestic comfort, for parties who are fitting up new houses. These men can, being in the business, purchase at much less cost than casual customers, and the purchaser, after paying commissions, really saves money. This would be the case also if "female decorative artists" were common; as they could purchase from the wholesale men, or at reduced rates, and their fee would be saved by the buyer in the reduced price of his articles. The business would require no capital, and after a woman made a start and furnished a few houses in such a manner as to show her taste was good, she would have enough to do to keep busy most of the time. This is a branch in which women could make money respectably and easily. Of course it could only be followed in the cities, and there might be danger of overcrowding; but those with good judgment and taste could soon make a reputation for themselves, and have no fear of too much competition.

The Pacific Mail Steamship Co., several of whose vessels have lately broken their propellers, have come to the conclusion that it is cheaper to make repairs by means of a coffer-dam than by putting the vessels in the dry dock. The "Costa Rica" lately arrived with a broken shaft, and the expense of docking and loss of time would be considerable but for the adoption of this method. The coffer-dam was placed under the stern of the ship one day this week, and, by means of three steam fire engines, pumped out in less than two hours. The men can work with perfect safety in this box, detaching the propeller and do other repairs necessary, while the company by this simple contrivance, saves at least $5,000.

Wheeler's Expedition Reports. — Lieut. Geo. M. Wheeler, of the Engineer Corps of the United States, will soon have ready the first volume relating to natural history—collections and observations made during his famous explorations. The work is in course of preparation by Dr. Garrow, the naturalist, and the plates will be prepared by Prof. Ridgeway, of the Smithsonian Institute.

A large amount of railroad material is going forward to Sparta, the present terminus of the Southern Pacific track, and it is understood that the company intend pushing on the road to Cerro Gordo pass, a point fifty-two miles from Sparta.

A well known resident of Napa valley claims to have discovered a fine ledge in Calistoga district, the croppings from which assay a large amount in gold and silver, principally the latter.

Paid Off.—The Belcher mine disbursed among its employes last week the sum of $95,000, the Crown Point paid $82,000 and the Yellow Jacket $13,000.

The New Mint.

The old mint on Commercial street, in this city, was closed last week, and on Thursday of this week the new mint building on the corner of Mission and Fifth streets was opened for the reception of deposits. The work of removing the machinery from the old to the new mint has been completed, and General La Grange has taken possession of the new quarters. The "old mint" was built in April, 1854. It cost $300,000, and it was for some time regarded as a complete institution of its kind, until the increased yield of precious metals demonstrated the need of of a larger establishment and the introduction of the trade dollar proved its inadequacy to supply the wants of commerce in this direction.

The new building, which has a front on Fifth street of 217 feet, and on Mission of 160 feet 6 inches, stands on a concrete foundation of four feet in depth, and is what is called a two-story and basement. The basement walls are built of Folsom granite and are four feet thick. The exterior of the other stories is built of free stone, steel colored, or what may be more properly designated a light gray. They are three feet thick. The hight of the basement story is 12 feet in the clear, the first story 18 feet and the second 16 feet. The extreme hight of the parapet wall is 56 feet. The pediment is 19 feet high. The two main chimneys tower above the roof 68 feet, and are richly ornamented with cast iron to a hight of 24 feet. The frame of the roof is iron, which is covered with copper and tinned on both sides. The building forms a square around an interior court, 43 feet 9 inches by 42 feet 6 inch.

The appropriation for this mint was $1,500,000 and on its completion there was $30,000 left, a somewhat surprising fact in these days. There are four engines in the building and four boilers. The machinery was all made in this city by H. J. Booth & Co. The boilers are each 48 inches in diameter and 15 feet long. Each boiler has a steam drum 36 inches in diameter and 10 feet long, and a mud drum 20 inches in diameter and 7 feet long. The water is fed to each and all the boilers with two of Knowles' steam pumps; diameter of steam cylinders 10 inches, and of pumps 3¼ inches; length of stroke, 6 inches. In addition to the feed pumps each pair of boilers are supplied with a No. 6 Giffard's injector, as an additional security in case of accident to the feed pumps.

The largest engine, No. 1, is of the vertical beam type, with bed-plate 6 feet 4 inches wide, 20 feet 4 inches long and 24 inches deep, and weighs 22,000 pounds. The main shaft is 10 inches in diameter and 19½ feet long. The band pulley is 15 feet 2 inches in diameter and 32 inches face, turned inside and out, and weighs 16,000 pounds. The fly-wheel is 18 feet in diameter and weighs 20,000 pounds, and is turned on its face and edges. The cylinder is 20 inches in diameter and 45 inches stroke. It has a steam jacket cast around the outside to prevent the condensation of steam, and is cased with felt 1½ inches thick and covered with black walnut, held in place with silver bands 3 inches wide. This engine is 150 horse power. Engine No. 2 is a horizontal engine with a 12-inch cylinder, 24-inch stroke, and is used for running the drawing and punching machines, machine shop and grinding room. The third engine is used to run the machinery of the sweep cellars, and is a first-class design of a vertical engine. The cylinder is 8 inches in diameter and 12-inch stroke. Engine No. 4 is used for the assay office. The cylinder is 6 inches in diameter and 18-inch stroke.

Everything in and about the mint has been arranged in first-class permanent style. The machinery is not only strong and durable but elegant in design and finish. The various departments in the mint are perfectly fitted up and all the various appliances are the best of their kind. The building is very strongly built and is the largest and most elegant mint building in the world.

The Krom concentrator at Mineral Park is said to have done all that was claimed for it. It is now steadily at work on ore from Miaeral Park. Some of the ore from the Tigress mine at Cerbat was sent to the concentrator, and then tried at the Buell furnace at Cerbat, and there is now some talk of sending to San Francisco for one of those concentrators, to attach to the furnace.

There are 40 tons of ore at Los Angeles from the Surprise valley mine, at Panamint, which is to be sent to England by steamer via Isthmus. The ore is very rich.

PASSENGER PIGEON.

Territorial Pioneers.

Pioneer societies are institutions peculiar to this coast. People who came here in the "winter of '49 and spring of '50" want others to remember the fact, and are very tenacious of the distinction. There are quite a number of pioneer societies in the different towns of this State, and others have been formed in Nevada and elsewhere. The largest one of this class is the Society of California Pioneers, of this city. They draw a very close line as to who are pioneers and who are not, which does not suit everybody, so a new pioneer society was organized this week, under the name of the "Territorial Pioneers of California."

Its objects are to collect and preserve historical facts and information in connection with the early and subsequent history of the Pacific coast; to form a library for the diffusion of useful knowledge among its members, by means of various books of history and science, periodicals and journals published throughout the world. To form a cabinet of such minerals, geological and other natural substances as shall be obtained by the association. To pursue such literary and scientific objects, by means of lectures or otherwise, as shall be deemed expedient by the Board of Directors. Furthermore, to form a more perfect union of the pioneers of California in the bonds of friendship, and to cultivate social intercourse between them.

The by-laws provide that all white males who were residents of the Territory of California prior to the 9th day of September, 1850—the day of the admission of the State into the Union—and the male descendants of all such, of lawful age, shall be eligible to membership; all white persons, residents of this State, who served the United States in the war with Mexico in 1846 and 1847, through which war California was acquired, shall be entitled to honorary membership. The association may elect as honorary members such persons as shall have rendered distinguished or important service to the association or State. Members desiring the names of their children entered as "Junior Pioneers" shall deliver to the Secretary their full name, age and place of birth, to be recorded in the Book of Registry.

The officers for the first year are as follows: Capt. J. M McDonald, President; David Meeker, 1st Vice-President; D. A Kneass, 2d Vice-President; Dr. Williard, Secretary; C. M. Boyd, Treasurer; John Stratman, Marshal; Board of Directors: L J. Hardy, H. W. Byington, General Winchester, F. A. Bonnard, W. K. Black, T. Rogers Johnson, A. S. Iredale, C. W. Davis, John Wade and Messrs. Morton and Pearson.

The Passenger Pigeon.

The passenger pigeon, or wild pigeon, of America, ranges far to the north and south of the United States, and westward to the Rocky mountains; but is very rarely met with, except in communities of millions or billions, requiring for their roosting-place an immense forest, the trees of which are soon crushed and blighted by their weight. This extraordinary gregariousness is wholly inexplicable.

The home, or roosting-place of this pigeon, is selected with reference to the abundance of beech and oak mast in the vicinity; that is to say, within a few hundred miles; for it is alleged of them that they fly at the rate of a mile a minute. Indeed, although they digest rice in twelve hours, food of this kind, which must have been procured in the fields of South Carolina or Georgia, has been found undigested in the stomachs of passenger pigeons killed in New York. They do not regard climate, except as it affects the supply of food; and only change their place of resort on this account, notwithstanding that men with nets and guns capture and destroy them, or rake their lodging trees with poles, burn sulphur under them, cut down the trees, and by various other devices slaughter them by thousands. Sometimes they remain in a region of country for years, and are then absent from it as long, or until their new range evinces a scarcity and their former one becomes abundant.

In the evening the air is sometimes darkened by these birds, as by an eclipse of the sun; a rushing noise is heard, in the midst of which the sound of a gun cannot be distinguished; and the air is put in motion by the flutter of their wings.

As the supply of food alone determines the migrations, they do not occur at any particular season. The power of flight enables these birds to traverse and survey an astonishing extent of country in a very short time; their power of vision seems to be as great, enabling them to perceive with certainty the resources of the country with respect to the food they seek. Thus, in passing over an inviting field they at once descend near the earth, but as promptly ascend to take a more extended range, when a sterile region is beneath them.

Their period of breeding is not influenced by season; the place is selected with reference to the contiguity of food and water. Forest trees of great hight are chosen, and upon these a hundred nests are often built, frail structures composed of a few dry twigs crossing each other, and supported by forks of the branches.

The New Vegetable Market of San Francisco.

In a recent number of the PRESS we gave a brief notice of the opening of the new vegetable market of San Francisco, promising to give our resders a more detailed account of the organization under whose auspices the market was erected, with a description of the structure. Although the vegetable business of San Francisco has been immense, it has until recently been transacted under difficulties to which such men as compose the bulk of our vegetable producers would not submit. Fate seems to have pitched their tents, or their vegetsble wagons, on Sansome street, between Commercial and Pacific streets; sometimes extendiug beyond these boundaries, including four blocks. The location of the vegetable market at this plsce msy be accounted for by the fact thst the old Washington Market, once *the* market of San Francisco, wss in this vicinity, on the corner of Washington and Sansome streets. This old market embraced nearly all the meat, vegetable and fruit trade of the city, and included various other products. But the expansion of the city in size and general prosperity, necessitated the erection of mest markets in other localities. The principal part of the fruit business, however, still remains in stores in this vicinity, and custom seems also to have kept the vegetsble here, scattered slong the street, ss we have previously described. But he location wss not satisfsctory to any psrties concerned. The merchants of the neighborhood were annoyed by the obstructions which the vegetsble trade occasioned, and made strenuous efforts to accomplish its removal, but with little satisfsction. The seversl efforts that were made to trsnsplant those mountains of vegetables were failures; for the interests and convenience of the majority seemed to demand that the trade should remsin there until its removal could be effected in a more legitimate manner.

Meanwhile the market men and their customers were quite ss desirous of a change as the business men in the neighborhood; for in the rainy sesson especially they were subjected to much discomfort and inconvenience; and dnring the past summer messures were adopted which resulted in the erection of the new vegetable market. This wss opened under the most favorable suspices and with appropriate ceremonies, on Suudsy, October 4th.

The msrket is owned by an incorporated compsny, of which P. Limi is President, aud F. G. Picosroli, Secretary. The building is located on the block bonnded by Pacific street on the north, Clark street on the sonth, Front street on the west and Davis street on the east. The dimensions of the hnilding are 275 feet by 120 feet. It has 76 stalls of uniform size, esch heing 9 feet by 23 feet. None but ranchers and gardeners are allowed to occupy a stall, and every occupant must be a stock owner. The stalls are not rented hut all occupsnts are subject to a monthly assessment. Every stsll is now taken. Of the occupants of the 76 stslls 71 are Italisns, and 5 are Frenchmen; yet although the Italian nationality greatly predomiuates in numbers there is nothing clsnnish in the least ahout the establishment.

The entrances proper to the market are on Front and Davis streets. These are sufficiently wide to allow two wagons to go abreast. They are covered hy high and tastefully constructed arches and closed hy drop gates. On each side of this central passage the stalls are located; those on the north side opening on Pacific street, those on the south side opening on Clark street—tbese openings are also closed hy drop gates the full width of the stalls. All these gates, including those of the regular entrances, are closed and locked during all but business hours. They are opened from 4 to 6 P. M. to admit such wagons as arrive over night, and from 3 to 10 A. M., they are opened for marketing. Many of the occupsnts vacate their stalls before the allotted time, and as each wagon departs the men who have charge of the premises sweep the vacated stalls; and when the hour of closing a'rives, the well planked floor is swept clean of all vestiges of the hundred tons and over of vegetables that have been disposed of then and there. As was stated in our account of the outdoor market on Sansome street, the sales at this market are made almost exclnsively to those who huy to sell again, owners of local markets in all parts of the city, and peddlers who dispose of their stock in the suburbs.

The building is high and roomy. It is painted inside and out with white, with the exception of the gates, which are of green. The ground upon which it ie located was leased by the company for a term of ten years. Up to the present time $12,000 has been expended upou it, and further improvements in the prospective. The enterprise thus far has heen quite as successful as anticipated, and the company is in a flourishing condition. A large portion of the vegetables sold here are grown in gardens in the county og San Francisco; the balance is from ranches in San Mateo county. San Francisco's vegetable display has hecome renowned even as seen under the disadvantages of the old outdoor market on Sansome street. Now, thanks to our enterprising Italian vegetable growors, we have a place worthy of the splendid exhibit, and those who visit our city will now he able to eee another of its sights with appropriate surroundings.

Rich Quartz in Eureka Township.

There is considerable excitement at present in Enreks township, over recent discoveries in quartz. Mr. Snapp, who formerly kept a hotel at Eureks, hss locsted a claim on a ledge on the stage rosd, between Shan's Station and Eureka which is over a hundred feet in width. It is composed on the surface of decomposed quartz, slate, cab and dirt, and any of the dirt prospects very rich. A panfull of dust taken from the road which crosses the ledge, when washed showed a good prospect. It is thought the whole mass would psy twenty-five dollars a ton if washed off hy hydraulic procees. The discoverer has had many offers to put up machinery and s mill for an interest, but as yet he has made no move in that direction.

Another Discovery.

Phillip Foy, Mike O'Brien, John Egan and others, have recently discovered a large ledge which is situated about two miles east of Eureka near the Erie mine. It is ssid to be eight feet in thickness and pieces of free gold as lsrge as a ten cent piece are frequently seen in it. The parties were working in a ravine near hy, and one of them ascended the hill one dsy to a cliff of rocks near the top. While carelessly hammering whst was supposed to he a granite boulder a piece flew off and upon examination it proved to he qusrtz. The discoverers went to work and rnn a tunnel and have found what they suppose to he a ledge of great value. Extensions were recorded in the Recorder's office yesterday.—*Nevada Transcript.*

THE Flsgstaff mill, at Parley's Park, Utsh, is rspidly approsching completion, and Mr. Howland, the superinteudent, hss a large force of men taking out rich ore to be ready to start the mill when completed.

The Mining and Scientific Press--Ever Onward.

Our careful system of compiling, judiciously condensing, and conveniently arranging into regular departments, has been heartily endorsed. It renders the paper worth more to readers, who can find handily thet which interests them most.

The weekly issues of the PRESS will contain reliable

Information for Practical Miners,

Treating on the Openlng of Mines; Mining of Ores; Milling of Ores; Smelting of Ores; Separation and Roasting of Ores; Amalgamation; Saving of Gold and all precions Metals; New Processes of Metallurgy; New Discoveries of Mines; Mining Engineering and Hydraulics.

For Inventors, Mechanics and Manufacturers.

All new and important developments in Scientific and Mechanical Progress; Patents and Inventions of the Pacific States; Progress of Home Industries; Hints for Local Manufacturers; Illustrations of New Machinery; Reports of Popular Scientific and Industrial Lectures.

Our Mining Summary

Gives the progress of mining work from week to week in the various counties and districts throughout the principal mining regions of the United States, arranged in alphabetical order. It is the most extensive record of mining operations published in the world. It affords the Intelligent miner a rare opportunity to know and profit hy the work and experience of his nelghhors. Miners have few sources of practical information in their calling, and should embrace every reliable means for improvement. Mining Operators and Shareholders, at home and abroad, weekly examine our Summary with Increased interest and profit.

Our "Domestic Economy"

Embraces new and important facts which should he known in every cabin and household. Short and interesting—the articles under this heading are freely read and practiced with profit and improvement to the readers.

The PRESS is not strictly a "paper for professional scientific men," hut rather a

Liberal and Popular Scientific Journal,

Well calculated to make practically scientific men from our intelligent masses. This is our stronghold for accomplishing good. Plain, correct and pleasing language, easily comprehended by all, confined mostly to short articles, is our endeavor.

For Self-Improvement,

Every issue of the PRESS abounds with articles of an elevating character, to stimulate the higher virtues and natures and progressive intellects of hoth men and women.

Hundreds of Dollars

Are oftentimes saved to the readers of this paper hy a single hint or article of information in its columns; Such instances have been repeatedly reported to the editors and proprietors durlng their long connection with the PRESS. Our paper presents

The New and Novel Developments

In the progress of this comparatively new section of the Union (hut recently settled and now rapidly increasing with a population of the most intelligent and venture. some people, attracted from nearly every quarter and clime on the globe), enahle us, with due enterprise, to display vigor and freshness in our columns not met with in similar journals elsewhere. The same circumstances also render such a paper more especially valnable to its readers in a new, and, to a certain measure, untried field, where the best methode and processes of industry are not so well established or traditionally known as in older communities. Published experiences often save costly experiments and disastrous results.

A Great Variety of Industrial Information,

In brief and fresh form, suited to the wants and tastes of the readers of this coast, which is not obtainable otherwise so timely, or in so cheap and convenient form. As an industrial publication, meeting the wants of so many kindred industries, this journal stands preeminent and without a precedent.

Miscellaneous.

Ayer's Sarsaparilla,

FOR PURIFYING THE BLOOD.

This compound of the vegetable alteratives, Sarsaparilla, Dock, Stillingia and Mandrake with the Iodides of Potassium and Iron makes a most effectnal cure of a series of complaints which are very prevalent and afflicting. It purifies the blood, purges out the lurking humors in the system, that undermine health and settle into troublesome disorders. Eruptions of the skin are the appearance on the surface of humors that should be expelled from the blood. Internal derangements are the determination of these same humors to some internal organ, or organs, whose action they derange, and whose substance they disease and destroy. AYER'S SARSAPARILLA expels these humors from the blood. When they are gone, the disorders they produce disappear, such as Ulcerations of the Liver, Stomach, Kidneys, Lungs, Eruptions and Erruptive Diseases of the Skin, St. Anthony's Fire, Rose or Erysipelas, Pimples, Pustules, Blotches, Boils, Tumors, Tetter and Salt Rheum, Scald Head, Ringworm, Ulcers and Sores, Rheumatism, Neuralgia, Pain in the Bones, Side and Head, Female Weakness, Sterility, Leucorrhea arising from internal ulceration and uterine disease, Dropsy, Dyspepsia, Emaciation and General Debility. With their departure health returns.

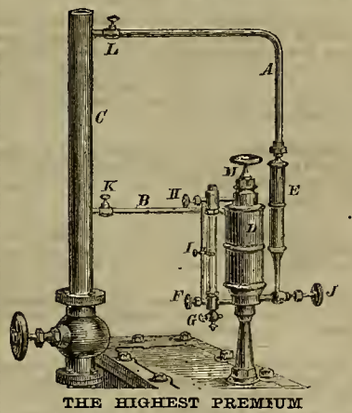
Machinery.

N. Seibert's Eureka Lubricators.



THE HIGHEST PREMIUM

Awarded by the Mechanics' Institute Fair, San Francisco, and State Fair, Sacramento, 1871.

These Lubricators are acknowledged by all engineers to be superior to any they have ever used; feed constantly by pressure of condensed water, supplied by pipe A, regulated under the oil by valve J, and forced out through check valve and pipe B into the steam pipe C; it then becomes greasy steam, passes to all the valves and cylinder at every stroke of the engine; glass tube I indicates amount used per hour. Packing on rods and stems lasts longer, and the rings on the piston will not corrode. One pint of oil will last from three to six days, according to speed and size of engine; I, sliding gauge; K, valve to shut off when engine stopps; H, F, valves to shut off in case of frost; steam does not enter the cup; it is always cool; warranted to give satisfaction. Patented February 14, 1871. Manufactured by California Brass Works, 125 First street, S. F. 24v23t

BALL'S

SWEEPING DREDGE,

A NEW AND VALUABLE

CALIFORNIA INVENTION,

Has been very lately well proven by performing a job of dredging at the mouth of San Antonio Creek, at Oakland, Cal.

There is but this one machine that has ever had these improvements employed. It is an old machine, formerly built for another device, and is unfavorably constructed for Ball's improvements; yet this first temporary experimental machine has filled a scow of eighty-five cubic yards in sixteen minutes in unfavorable digging. For durability, digging hard material and fast work, it has a reputation (supported by leading engineers) as having no equal.

Testimonials and references will be given on application to the inventor, who is the sole owner of patents (excepting having made an assignment of the one machine now belonging to the Central Pacific Railroad Company). Having resolved not to sell any rights unless upon a *basis* of actual work performed by a machine built by myself for the purpose of fairly establishing the worth of the invention, I therefore offer to sell machines or rights on the following plan, which is warranting the capacity of the machine by actual work:

I will enter into an agreement with any responsible party to build and sell a machine, scows and tender, all complete, and right of all my improvements in dredging machines throughout the Pacific Coast for $20,000, warranting the machine to dredge six cubic yards per minute (to fill a scow at that rate). $20,000 will but little more than pay the cost of building the machine, scows, etc., all complete; therefore I am proposing to ask *nothing* for my patents unless my machine dredges more than six cubic yards per minute. But it shall be further agreed that in case (at a fair trial to be made within a stated time) the machine shall fill a scow at the rate of more than six cubic yards per minute, then $10,000 shall be added to the price above stated for each and every such additional cubic yard thus dredged per minute, and for additional fractions of a cubic yard thus dredged in the same ratio the $10,000 is to be added to said price above stated.

I will sell any other Territorial or State rights (either United States or Foreign) upon the same plan and at a lower price proportionately than the rights for the Pacific Coast.

I will sell a single machine with scows and all complete, and right to use the same in a limited territory, for $20,000 on the same plan as above stated, but will add only $2,000 to each additional yard over the six cubic yards per minute. Each machine is not to employ more than two 10x20 inch engines.

Payments to be made in U. S. gold coin on delivery of machine, as may be indicated by agreement.

Address, JOHN A. BALL,
9v28-tf Oakland.

General News Items.

Increase of Population.—Ths incrsase of popnlation to California is grsater from yesr to year. Our popnlation is now only about 800,000, wbile we have ssvsral single countiss each nearly as large as the State of Massschusetts, wbich contains a population of 1,500,000, San Bsrnardino county is larger than Massachussttş. To show how San Frsncisco isgrowing we may ssy tbst one singls building associstion in this city —tbe Resl Estate Associstes— havs erected 267 houss during the past ysar, all ssparate gsntsel dwellings two and three stories higb; whils they sxpsct to erect svsn a larger number nsxt year. California will, in a few ysars, becoms ths riobest and most popnlous Stats in the Union.

Large Bunches op Grapes. — A bnnch of Black Hambnrg grapes was lately sbown at the Great Internationsl Horticultnrsl Exhibition, at Belfast, which weighed 20 ponnds 12 onnces. This was fnrnished by Mr. Hnnter, of Lambton Castle, and exceeds the wsight of Speechly's cluster of Syrian by about a pound. Setting asids the fact that the latter variety is a mnch coarser graps, bearing large clnsters nnder the most ordinary cultivation, the analogy between the two grapes in this case is similar to that existing between a Queen Pins and a Providence. This clustsr is the largest as yet grown in Britain, and, like the celsbrated fifteenpond Providence Pioe grown at Gunnersbury by Mills, will long be remsmbered as a triumph in ths history of fruit culture.

Hay for Fuel.—The bay in some parts of Iowa is so abnndant and cheap that it has bsen found more economical as a fuel for steam purposss, than peat or any otber substancs. One enterprising invsntor wishes to know if he can obtain a patsut for the idea of using hay for fnel in steam boilers. He thinks it new in the annals of steam enginsering to nse hay for firing. Patents have been taken out in California for nsing straw for steam fuel —the same will, of course, apply to bay—moreovsr, snch fnel has been fonnd both effective and economical.

More Land Fon The Market.—Ths oommissioners appointed to inspect the U. P. R. R., will soon report that the road has besn compellsd in accordance with ths Act of Congress; when the land grant—some 12,000,000 acres—will he confirmed to the company. Much of this land will nndoubtsdly be soon sold to settlers, which will rapidly increass popnlation in that direction. This can scarcely prove otberwise than bsnefi.ial to the State.

A Terrible Tragedy.—One Edward Maguire, a shosmaker, of this city, who has livsd apart from his wife, sought her out on Sunday last; found her at hsr temporary home with a respsctable family, chased her from the bouse with a gun, and finally shot her in the midst of her flight and cries for assistancs. Tbe brute was arrested by witnesses upon the spot, and waa to hsvs had an examinatiou on Thursdsy.

Holding Back Grain.—Like the farmers of California those of the West seem disposed to hold tbsir graiu rather than sacrifice it at rates at present ruling, and a Chicago paper lately reported five miles of cars side tracked upon three of the rosds centering in that city, for lack of work.

The Three Brothers.—This nohls ship, which left San Francisco October 12th, 1873, witb the largsst cargo of wheat wbich was ever put on board of a single ship, returned again the past wsek, having hsen absent 380 days. The "Three Brothers" is now the largest sailing ship afloat.

Our California spring bas come. In Oakland tbe strests are already linsd with new green grass. Dandelions are in perfect bloom. The latter, contrary to their Eastern sisters, go to sleep daily, about nine A.M., in snnshiny weatber.

Land Suit.—An important land suit has bsen commenced by George W. Dent, against the Pacific railroad, John B. Felton and othsrs for possession of the marsh laud composing the Oakland and Alameda water front.

The Postoffics Department hss abandonsd the idea of making tbst Department self-sustaining, for the pressnt at least. The great difficulty in ths way of rstrenchment liss in the qnestion of newspapers and other printed mattsr.

Won't Give it Up.—An exchange says: Three-card monte sharps have made up a pnrse to fight the Union Pacific and Central Pacific Railroad companies, and intend to employ eminent connsel.

The late political ontbreak of popular npinion has created considsrabls snrprise and no little consternatiou in England and tne Europsan Continent. Its msaning is not yet fully understood.

The Young Prince Napoleon Betrothed. Ths marriage of the Princs Imperial to a danghter of the Russian Grand Duchess Marie is mentionsd in Bonapartist circlss as a probable event.

The Palace Hotel.—Work npon this strnctnre is progressing with the ntmost vigor. The force employed upon ths hotsl, sxclnsive of ths snperintsndent and his staff, clsrks, mssssngers, book kespers, etc., is about 1,300, of whioh number about 160 ars hoys who are engagsd as apprentiess in lathing. In sddition to this nnmber, a large contract forcs ars sngaged on the cornice work, and many mors directly in tbe msnufactnrs and transportation of material. The cslcnlation is made that no less than 10,000 persons, men, womsn and children, srs at present depsndent npon the cnrrent disbursmsnts of the Palace Hotel enterprise. Moreovsr, when this work is completsd, ths ssms parties havs in contsmplation other imnrovements on a similar gigantic scale, whicb will requirs tbe ssrvices of all those peopls for years to coms. Ths era of great and psrmanent improvsmsnt bas now fairly dawned npon Californis, and will continne to inorease for generations to come.

Rye por Hay.—As sesding time is approaching, we wish to give a hint abont raising rye for hay. Mr. Snndsrland, of Murphy's cañon, west of Gilroy, has sowed rye with the best of sncsss for several ssssons. It is liked as well as whsat. After one season's use by livery men thsy considsr it desirable. One important thing in its favor is the fact that sqnirrels do not molest it nnless it is allowed to fully ripen. On the billy land in that section it produces a larger crop. It requires cntting promptly at a season before ripe, and should not be allowed too long in tbe cock. Rye shonld he tboronghly tried by all hay raissrs on footbill lands.

Oregon has now an unpaid Board of Immigration Commissioners, appointed by the Governor in accordance with an act pssssd by the Stats Legislature during its recsnt session. The nbject of the Board is to sncourags immigration into that State.

Heavy Tolls.—Tbe farmsrs of Sntter county complain of ths tolls on the Feather river bridge.

Wm. Thomas, of Los Angeles, is msking arrangsments to plant an orcbard of 50,000 acres.

The Central City *Register* says tbe valns of the gold bullion shipped by the banks of tbat city for the week ending Novembsr 4th, was $45,000. This is $19,200 in exoss of tbe preceeding week's shipments, and $1,000 above the avarags of weekly shipments for ths cnrrent year.

According to ths newspapers they are finding ladges in Napa county the croppings from which assay $7,000 per ton. Tbe man who makes the statsmsnt to the Vallejo *Chronicle*, although a well known rssident of Napa valley, refnses to lst his name bs used. Ssnsible in ons thing, at any rate.

The safsty cage of the Ophir mine was well tested the othsr day, whsn a oage witb a car of ore was being hoisted and the cable broke. The cage did not fall half an inch, tbrongb tbe efficiency of the safety apparatns.

They are finding free qnicksilver in the bottom of wells in Sonoma county. Tbey will find it ready "flasked" next; bnt why don't tbey find enough of it to bring the prics lower than $1.55 per ponnd.

Jas. S. Kelly, assayer, of Seattle, reports lats discoveries of silver mines on Silver creek, a tribntary of Skykomish river, and also of placsr mines. A company will he organized to work the new mines.

The Redington quicksilver mining company shipped during the month of October 1,000 flasks of qnicksilver. Ths nsnal shipment has been about 600 flasks.

Several chrome iron mines havs lstely heen discovered in ths vicinity of Calistoga. The hills south of tbe town are reported to contain large qnantities.

There was coined at the Carson Mint dnring October $541,000 in gold and silver, the largest amount ever coined at tbat instituton in a single month.

During the month of October 2,798 car losds, or 19,585 tons of ore, were shipped over the Virginia and Tnckee railroad to mills at Silver City and on the Carson river.

The amonnt of qnartz sold in Helena, Montana, dnring the past six months has placed over $150,000 in circnlation.

Prepanations ars being actively made to open np a number of hydraulic claims in the vicinity of Jackson, Amador county.

A gold bearing ledge bas been discovered in Santa Rosa township, Sonoma county.

Rich quartz discoveries have been mads lately in Eurska Township, Nevada county.

Sonoma county has nine tanneries in operation.

Patents & Inventions.

A Weekly List of U. S. Patents Issued to Pacific Coast Inventors.

[From Official Reports for the Mining and Scientific Press, Dewey & Co., Publishers and U. S. and Foreign Patent Agents.]

By Special Dispatch, Dated Washington, D. C., Nov. 10th, 1874.

For Week Ending Oct. 27th, 1874.*

Machine for Molding and Pressing Bituminous Compounds.—Rodman Gibbons and Robert Skinnsr, S. F., Cal.

Heater for Cheese Vats, Etc.—Geo. Harris, Pstalnma, Cal.

Ben Lounge.—John Hoey, S. F., Cal.

Apparatus for Suspending Tobacco.—Sebra Mathswson, Gilroy, Cal.

Scale for Weighing Coins.—Wm. Schmolz, S. F., Cal.

Stone-Splitting Machine.—Stephen S. Brooks, S. F., Cal.

Machine for Turning Globular Forms.—Andrew J. Kane, S. F., Cal.

Dust Cap for Watch Regulatobs.—Wenzel H. B. Sebmied, Napa, Cal.

Socket for Broom Handles.—Henry Anderson and James F. Houghton, Sacramento, Cal.

Gate Latch.—Edward Halsey, San José, Cal.

*The patents are not ready for delivery by the Patent Office until some 14 days after the date of issne.

Note.—Copies of U. S. and Foreign Patents furnished by Dewey & Co., in the shortest time poesible (by telegraph or otherwise) at the lowest rates. All patent bnsinees for Pacific coast inventors transacted with perfect security and in tbe ehortest time possible.

From an Inventor.

The following lsttsr, which was rscently received from an old client of Dewey & Co., now residing in one of the Eastern States, speaks for itsslf, and will do more, perhaps, to convince inventora of onr capacity for business than any nnmber of local compliments. We extract as follows:

Gentlemen: It was throngh your house that I secured my first patent, and although I have since done bnsinsss here in the Atlantic States with tbe ahlest patent solicitors—gentlemen who have done ms justice—yet I have often regretted that yon wers too far off to advise with me in my cases. It has taken a longer time with every patent I have taken ont since I left California and cams Esst, than in ths cases you preparsd for me in San Francisco, which is certainly vsry creditable to you.

By the way, one of my patents has passed the ordeal wbich is the essential test of a patent's valne. I mean that of a trial in tbe conrts, and it stood the battling of ons of the best lawyers in the conntry. The specifications and claims wsre completely made out and there was a psrfect comprehension of its principle dnring the trial. Since giving it this test we thought that we wonld make it even stronger, if possible, and submitted it to one of the best patsnt solicitors for advice. After a careful examination of tbe oass he advised ns to let it alone as it stood, saying that whoever made np those papers nnderstood their bnsiness. I then informsd him that they were drawn np by Dewsy & Co., of San Francisco, and he replied that he knew you well by reputation. * * * * * Very truly yonrs,

L. L. Sawyer.

Meriden. Conn., May 16, 1874.

Copper Smelter.—A new furnace has been built at Riverside, Utah, to smelt coppsr ores from San Francisco district, as that metal is fonnd in large qnantities in that camp. This furnace was bnilt, and is owned and now managed by Mr. W. Willlams, a gentlsman who has had yeara of expsrience.

Mining Sales.—A sale of soms good mining property in San Francisco district, Utah, has recently been effected with some moneyed men from the East.

During October the nnmbsr of throngh passengsrs nver the Csntral Pacific railroad was: Going East, 2,456; coming West, 7,495.

The largest plats of glass ever mannfactured in the United States was recently cast in Indiana. It is 184x91 inches.

A collection of minerals from all tbe mines in Nevada will be represented at tbe Centennial exhibition.

Ma. Alvinza Hayward retnrnsd from Japan on the last steamer, with rsstorsd health.

At Salt Lake, October 31st, the first iron evsr mannfactnrsd in Utah was shipped Esst.

Plaven Out Nostrums—Will codfish oil cure consumptive cough? No! Will opiates? No!! Will inhalation? No!!! Can such a cough be cured at all? Yes, it can. Reject all these nostrums; they have been weighed in the balance and found wanting. Try *Hale's Honey of Horehound and Tar*. Thousande upon thousands are using it. Millions have tried it. So far it has never disappointed any man or woman who took it for a cough or cold however violent.

Pike's Tooth-Ache Drops—Cure in one minute.

Hints about Advertising.

If you have goode to eell farmers, how mnch better will it pay you to advertise in a farming paper, closely read by 15,000 intelligent farmers, than in miecellaneous daily or weekly journals with 30,000 readers, comprising only 2,000 farmers. A mining journal in California with 15,000 readers reaches more intelligent miners than any other 10 papers in the Union.

Purchasers are more likely to look for information in the advertising columns of a paper devoted to their special interests, than elsewhere, when ready to buy. Some will not read advertisements upon any other occasion, but seek the best paper when wanted.

If you happen to be the only advertiser in your line of business in a paper, all the better. But if several firms advertiee the same, your own jndgment will question whether you can best afford to go unrepresented.

Weekly journals are read most leisurely and carefully, and at a time when the subscriber is most favorably inclined to examine advertisements. The newspaper most especially representing your particular branch of industry is usually best entitled to your patronage, and the most profitable medium you can employ.

An advertisement in an honest and handsome sheet is favorable to the reputation of the advertiser. The readers of the Press are a superior and industrious class, who are able to purchase and who seek to patronize the best and fairest dealing tradeemen.

Advertising in cheap priced mediums (of limited circulation) is like bnying goods at retail when you could as well take them at wholesale.

Information imparted to a list of superior and intelligent and active and industrious readers (naturally looked up to by others for information), is seed sown in good soil for the advertiser.

Fame and fortune are gained, nine times in ten, by liberal and judicious advertising.

Our Agents.

Our Friends can do much in ald of our paper and the cause of practical knowledge and science, by assisting Agents in their labors of canvassing, by lending their influence and encouraging favors. We intend to send none bnt worthy men.

L. P. McCarty—General Agent.
W. H. Rattenbeary—California.
Chas. W. Cite—Contra Costa County.
Chas. T. Bell—Alameda, Santa Clara and Santa Cruz Counties.
J. W. Anderson—Orange and Santa Ana, in Los Angeles County, Cal.
Hoon Alston—San Luis Obispo, San Bernardino and San Diego Counties.
Jas. Kearney—Amador, Calaveras, Tuolumne and Mariposa Counties.
B. Goodwin—Sacramento County.
S. G. Crawford—Nevada, Sierra and Plumas Counties.
J. G. Kelley—For Washington Territory.
B. W. Crowell—California.
F. B. Alderson—Nevada.

The Scientific Press.—This valuable journal entered upon the seventeenth year of its publication on the 4th of July. The steady advance in character, that every reader has noticed in the paper, renders it unnecessary to make any splurge of improvement, and the publishers simply content themselves with the announcement that they will continue to make their paper as interesting as possible. That it is interesting to a large class of readers, the wide circulation and extensive influence of the Press, is sufficient evidence.—*Placer Argus*.

New Inventions!

Of real merit, if brought plainly before the pnblic when fresh, are most likely to become profitable to the patentee. For this reason, patentees (of worthy devices) should have the best of Engravings Made, and published in the Press. Snperior Engravings Made, at reasonable rates, by artists in this office bp-tf

THE NEW U. S. MINING LAWS.

The new Laws of 1872, governing the location and purchass of Placer and Qnartz Mines and Agricultural Lands in Mining Districts of the U. S., printed in circular sheet, for sale at this office. Sample copies, 25 cts

Wand Cuts for Sale.

We are willing to sell a large number of the wood cuts and electrotypes which have appeared in the Press, on very liberal terms to publishers abroad, and would invite correspondence on that business.

Truckee, Cal., July 10, 1874.

Messrs. Dewey & Co.—*Gentlemen:* My patent is just received, and is entirely satisfactory. Permit me to tender you my sincerest thanks for the care and attention, the promptness and interest you have displayed in managing my affairs. Gratefully yours

O. F. McGlashan.

For State of Nevada.—We have appointed Mr. F. B. Alderson our especial agent and correspondent for the State of Nevada. He will visit our friends and patrone there soon.

The Mining & Scientific Press

Started in 1860, is one of the oldest weekly journals now published in San Francisco. It has been conducted by its present proprietors for ten years, during which period it has been repeatedly enlarged and constantly improved. The active and steadfast efforts of its publishers have gained for its conduct an amount of practical experience greater than any other publishers have accumulated on this coast, of a weekly journal.

The sum paid by us for the best editorial talent obtainable for our special class journal; for engravings, for interesting news and correspondence, and for printing a large-sized, handsome sheet, is unequelled by that of any other American weekly west of the Mississippi.

As a PRACTICAL MINING JOURNAL it has no rival on this Continent.

It is the only MECHANICAL, and the only SCIENTIFIC Journal of the Pacific States.

Miners, Assayers, Millman, and Metallurgist in the United States should take it.

Pacific Coast Mechanics, Engineers, Inventors, Manufacturers, Professional Men, and Progressive and Industrial Students should patronize its columns for fresh and valuable information.

Mining Engineers, Superintendents, Metallurgists, Mine Owners and Mine Workers throughout the world should profit by its illustrations and descriptions of New Machinery, Processes, Discoveries and Record of Mining Events.

Intelligent thinkers throughout the land, in high or humble situation, who would avoid literary trash for genuine information, should SUBSCRIBE AT ONCE.

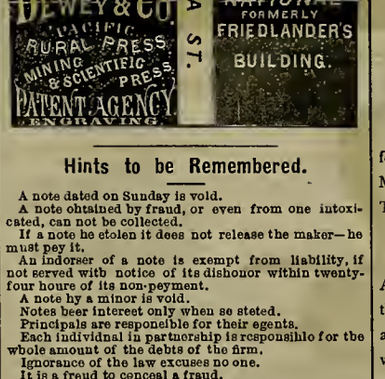
DEWEY & CO.,
No. 224 Sansome street, S. F.

The Pacific Rural Press

Is a Large and Handsomely Illustrated Agricultural Home Journal; Original, Instructive and Attractive; its varied contents, ably written and condensed, render it popular with its readers. We endeavor to make it a credit to the field it occupies, and to every intelligent circle it enters. ENTIRELY FREE FROM POLITICS, its columns are filled with cheerful words of encouragement for our Pacific Industries and instruction for the people. It extends information of the growing wants and necessities of our rapidly increasing and progressing agriculture. You can read it with pleasure, for present and future profit; you can send it with satisfaction to your friends anywhere. Its editorials are earnest and its contents reliable. No questionable advertisements darken its pages. It is a journal for rural homes throughout the Coast. It is a handsome home print, without a rival on this half of the Continent. Subscription, in advance, $4 a year.

DEWEY & CO., Publishers,
No. 224 Sansome St., S. F. 3p-tf

Location of Dewey & Co.'s New Offices since July, 1874.



Hints to be Remembered.

A note dated on Sunday is void.
A note obtained by fraud, or even from one intoxicated, can not be collected.
If a note be stolen it does not release the maker—he must pay it.
An indorser of a note is exempt from liability, if not served with notice of its dishonor within twenty-four hours of its non-peyment.
A note by a minor is void.
Notes beer interest only when so steted.
Principals are responsible for their egents.
Each individual in partnership is responsible for the whole amount of the debts of the firm.
Ignorance of the law excuses no one.
It is a fraud to conceal a fraud.
The law compels no one to do impessibilities.
An egreement without consideration is void.
Signetures in leed pencil are good in law.
A receipt for money is not legally conclusive.
The acte of one partner bind all the others.
Contracts made on Sunday can not be enforced.
A contrect made with a minor is void

FROM AN INVENTOR.

PLACERVILLE, October 3d, 1874.

MESSRS. DEWEY & CO.—*Gentlemen:* Yesterday I received from you my Lettere Patent for my Hydranlic Mining Lamp, and I berewith tender you my grateful acknowledgements for the energy and promptness which you heve displayed in working seid invention through the Patent Office for me; and shall in the fui re, as well as the past, recommend all parties having inventions, to go direct to the office of Dewey & Co., and ask for Mr. Boone, in the Patent Department, and if he cannot procure a patent for them they will find it useless to try further. Yours Respectfully,
O. B. BROWN.

THE MINING AND SCIENTIFIC PRESS, San Francisco, we regard as the best paper for miners published anywhere in the world. Subscribers should be careful to put on file each number; and each year's edition, bound in a volume, would prove a most valuable book to all reading men engaged in mining or in the reduction of ores.—*Boulder News.*

Scientific and Practical Books on Mining, Metallurgy, Etc.

Published or issued, wholesale and Retail, by DEWEY CO., MINING AND SCIENTIFIC PRESS Office, S. F.

BY GUIDO KUSTEL,
MINING ENGINEER AND METALLURGIST.

Roasting of Gold and Silver Ores, and the Extraction of their Respective Metals without Quick silver. 1870.

This rare book on the treatment of gold and silver ores without quicksilver, is liberally illustrated and crammed full of facts. It gives short and concise descriptions of various processes and apparatus employed in this country and in Europe, and explains the why and wherefore.

It contains 142 pages, embracing illustrations of furnaces, implements and working apparatus.

It is a work of great merit, by an author whose reputation is unsurpassed in his speciality.

Price $2.50 coin, or $3 currency, postage free

Concentration of Ores (of all kinds), including the Chlorination Process for Gold-bearing Sulphurets, Arseniurets, and Gold and Silver Ores generally, with 120 Lithographic Diagrams. 1867.

This work is unequaled by any other published, embracing the subjects treated. Its authority is highly esteemed and regarded by its readers; containing, as it does, much essential information to the Miner, Millman, Metallurgist, and other professional workers in ores and minerals, which cannot be found elsewhere in print. It also abounds throughout with facts and instructions rendered valuable by being clearly rendered together and in simple order. It contains 120 diagrams, illustrating machinery, etc., which alone are of the greatest value. PRICE REDUCED TO $5.

Nevada and California Processes of Silver and Gold Extraction, for general use, and especially for the Mining Public of California and Nevada, with full explanations and directions for all metallurgical operations connected with silver and gold from a preliminary examination of the ore to the final casting of the ingot. Also, a description of the general metallurgy of silver ores. 1864.

As its title indicates, this work gives a wide range of information, applicable to all vein miners and workers in precious metals, affording hints and assistance of exceeding value to both the moderately informed and the most expert operator.

Price, $5 in cloth; $6 in leather—coin.

BY OTHER AUTHORS.

The Quartz Operator's Hand-Book; by P. M. Randell. 1871. Revised and Enlarged Edition. Cloth bound, 175 pages. Price, $2.

Sulphurets: What They Are, How Concentrated, How Assayed, and How Worked; with a Chapter on the Blow-Pipe Assay of Minerals. By Wm. M. Barstow, M. D.; 1867; cloth bound, 114 pages. Printed and sold by DEWEY & CO. Price, $1; postage free. The best written work, and most complete work on the subject treated.

ANY OTHER BOOKS DESIRED will be furnished at the most reasonable rates by DEWEY & CO., Mining and Scientific Press Office, S. F.

Designing and Engraving at This Office.

We are prepared to do fine Wood Engraving for illustrating Landscape Scenery, Buildings, Machinery, Works of Art, Manufactured Articles, Trade Marks, Seals, Etc. We have a first-class

Machine for Engraving

A portion of the work, which can be finished thereby more perfectly than by the eye and hand alone. Our patrons can depend upon first-class work always, and at reasonable prices. Samples can be seen at our office.

DEWEY & CO.

A COMPLIMENT.

PLAINSBURG, MERCED CO., CAL., June 22, 1874.

DEWEY & CO.—*Gentlemen:* I herewith tender my grateful acknowledgements for the energy, promptness and efficiency which you have displayed in procuring my patent.

Although you were entire strangers to me when I first communicated with you, I soon felt satisfied you were gentlemen of integrity, and shall always be happy to represent you as such. Very truly yours,
H. W. RUCKER, M. D.

To Mining Secretaries.

An amendment to Section 336 of the California Code, taking effect **July 1st, 1874,** provides that in addition to the regular publication of the assessment and sale notices as heretofore.

PERSONAL NOTICE

Must be served as provided in the following quotation from the law:

"The notice must be personally served upon each stockholder, or in lieu of personal service, must be sent through the mail, addressed to each stockholder at his place of residence, if known, and if not known, at the place where the principal office of the Corporation is situated."

The above refers to the ASSESSMENT NOTICE only. Advertisers in the MINING AND SCIENTIFIC PRESS will be furnished with copies of assessment notices printed on slips suitable for serving personal notice under this law at short notice.

DEWEY & CO., Publishers.

7v25-tf JOHN TAYLOR & CO.

Varney's Patent Amalgamator.

These Machines Stand Unrivaled.

For rapidity pulverizing and amalgamating ores, they have no equal. No effort has been, or will be spared to have them constructed in the most perfect manner and of the great number now in operation, not one has ever required repairs. The constant and increasing demand for them is sufficient evidence of their merits.

They are constructed so as to apply steam directly into the pulp, or with steam bottoms, as desired.

This Amalgamator Operates as Follows.

The pan being filled, the motion of the muller forces the pulp to the center, where it is drawn down through the apperture and between the grinding surfaces.—Thence it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, and to the circumference as before. Thus it is constantly passing a regular flow between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powder, and the metal amalgamated.

Setters made on the same principle excel all others. They bring the pulp so constantly and perfectly in contact with quicksilver, that the particles are rapidly and completely absorbed.

Mill-men are invited to examine these pans and setters for themselves, at the office, 229 Fremont Street, San Francisco

San Francisco Microscopical Society.

The regular meeting of this Society was held on Thursday of last week. W. R. Barbour was elected a resident member. The principal business of the meeting was a paper by Dr. Harkness, giving a description of a fungus found on the scorched willows in San Mateo county, and which was presented to the Academy of Sciences by Dr. Cooper at a meeting last month, supplementing the same by oral descriptions of fungoid growth, using the yeast plant and mushroom, which he exhibited under the microscope, to illustrate the subject. Dr. Harkness' paper was as follows: At the last meeting of your Society a specimen of fungus found attached to a gummy exudation upon the trunk of a willow was submitted to me for examination. Having given the subject a somewhat hasty examination I offer the following report:

The willow gum on which the plant was discovered is of a dark red color, is readily soluble in water, but insoluble in alcohol, and contains a considerable amount of salicine. Some few shrunken threads of mycelium are still to be traced upon its surface; it, of course, having served as the parent of the plant. The enlarged filamentous hyphæ is, however, the portion of greatest interest. The hyphæ is of a bright, orange color, of an inch or more in length, and is enveloped in a gummy substance amalgamous to that on which the plant is found. This gummy envelop is not soluble in alcohol, while in water this, together with the cell structure of the plant, is rapidly dissolved. The structure of the plant is not readily made out. By allowing glycerine to flow under the covering glass, using the spot lens and a ¼ objective, a faint trace of spiral tubes may be detected running through the long diameter of the plant.

Treated in the same manner under a ⅛-inch objective, indications of transverse striæ become apparent, marking the boundaries of cells. On applying a strong tincture of iodine these striæ become still more conspicuous. In almond oil slight traces of imbricated cells of the epiderm appear. Its method of growth is doubtless analagous to that of all other plants of this genus.

Its method or reproduction is by conjugation, as it would appear, although I am unable this evening to demonstrate the actual presence of the exhausted male plant. My conclusions, however, are based on the following facts: On placing a portion of a filament on an uncovered slide with the half-inch objective, and adding water, the plant immediately begins to swell, and slight protuberances appearing on one side, corresponding to those seen in the Zygnema and other varieties of the conjugating confervæ. As the gummy envelop is dissolved away from the protuberances, motile gonidia spores are discharged in enormous numbers. In this experiment we obtain no further proof (except by the appearance of the protuberances) of the existence of the male plant. In the confervæ we see the cells, exhausted of their protoplasm, lying at an appreciable distance from those of the spore-producing plant. In the present instance the exhausted cell is in such complete contact that the moisture which acts on the one instantly obliterates the other. If we use acetic acid in the same manner as in the preceding experiment, we find that the acid acts still more energetically than water; and on the instant of disruption we may occasionally catch a glimpse of the two bodies flying away in opposite directions.

The gonidia spores are exceedingly minute; oblong in shape, and in their shortest measurement being less than a twenty-thousandth of an inch in diameter. With a-half or a-fourth objective and a spot lens, if we allow glycerine and camphor water to flow gradually under the covering glass, the action is less violent, and we may at our leisure observe the spores as they swim away in the finid propelled by their moving cilia. Aside from their scientific value they form a very pleasing picture as the glinting light plays upon their sides with every change in position. I am unable to class the plant with any described variety, yet I dare not say that it is new to science. The characteristics which I have described, however, would seem to preclude the possibility of its complete development in any other than a dry climate.

STEEL DIRECT FROM THE ORE.—Mr. A. L. Holley, New York, read before the British Iron and Steel Institute, at its late meeting at Barrow, an interesting paper describing the rolling mills machinery arrangements in America, and showing the marvellous products of iron and steel which could be put forth in a day. The paper induced much discussion on the practicability of making steel at one fusion, but it was stated a Lancashire steel producing firm would shortly put down new blast furnaces, by which molten iron could be converted into steel direct from the furnace in which the ore was smelted. Mr. Holley also read another paper on the improvements in setting Bessemer converters, and noticed the simplicity and economy of time which has resulted in America by the process in vogue here.

HOT AND COLD ROLLED IRON.—Prof. Turner remarks that it is customary to attribute greater strength to cold rolled iron than to that which has been rolled hot. Although experiment has shown that such is the case with new iron, yet this is of little importance in practical use, because is does not last. The strength of such iron, says Prof. Turner, decreases gradually with time. This is a question which it would be well to determine by experiment,

Idaho Mine.

We paid a visit to the Idaho day before yesterday for the porpose of laying before our readers what was being done at our great mine. The first thing we noticed, after passing through the mill, where everything was running briskly and effectually, was the busy scene that was to be witnessed around the "old shaft." The shaft has all been retimbered and thoroughly refitted for the pump. It is 200 feet perpendicular, then it slopes off to a very steep grade. There will be no hoisting done through this shaft. To the east of the shaft they have put in a solid stone basement about six feet thick on which to place the pumping engine. This foundation is surmounted by brickwork for the engine itself. Two boilers are now being laid in brick. Everything bo okens substantiability. We learn that it is the intention to make the engine house of brick, to serve as a preventive of fire. It is situated between the hoisting works and mill, so that if either should burn the center brick building would serve as a safety for the other. Passing through this part of the works we saw the bob of the new pump. It is a massive structure—weighing between three and a half and four tons—and is made of one and a half inch iron. It was all made at the mine by Mr. Samuel Tyrrell, foreman of the blacksmith shop. It is strongly welded together and is of great strength. The gudgeon on which it will work is a nioe-iooh wrought iron bar. Great strength is required in this, as it will have to raise 700 feet of rod besides the water and resistance.

A large quantity of 14-inch pipe is already on the ground. This is larger than is really needed, but the far-seeing Superintendent has them large enough to provide for all reasonablo emergencies. Another bob is to be made to go underground of inch iron. They are pumping through the old shaft now, bnt are using the underground pumps, which are worked by steam conveyed from the hoisting works. Their water works are complete. A large tank, or more properly, a reservoir, gives a pressnre of 150 feet, and plenty of water to run hydrants, from each of which they have hose enough to reach any part of the mine. The shaft is now down about 870 feet, but the cages do not run further than the 200-foot level, at which level they are running two drifts—one east and the other west. The Burleigh drill is at work steadily in the east drift. Mr. Lacy, one of the agents for the drill on this coast, is at present instructing the miners how to run it. Three more are on the ground to be used as soon as practicable. Over 200 miners are now employed—more than at any time before, and the works underground are full of rock. The quartz in the bottom of the shaft is looking splendid—indeed it is very rich. They propose introducing yet another improvement in the mine, and that is firing the holes by electricity. An electric battery will he employed, and a dozen or more holes can be exploded at once. By this means it will add much safety to the men, as they can get out of the way before the machine is let loose.—*Grass Valley Union.*

Bear and Holcomb Valley Mines.

We condense the following facts from correspondence of the *Call*, from Bear valley: It is almost impossible for me to describe these two valleys with their immense quartz mountains. Holcomb valley is an old mining camp (placer), and is divided by a large mountain from Bear valley, some eight miles distant by the road, but only about three and a half miles by a new road, which, I believe, it is the intenion of the Gold Mountain mioing company to build. Holcomb valley is beautifully situated, and contains about one dozen honses. There is a five-stamp quartz mill and saw mill, but the quartz mill is shut down for the present. The mill belongs to an Eoglish company, which has been working a quartz mine in the neighborhood, under the snperintendency of Mr. Haley. The saw mill is run by Mr. McCaskell, and is ontting the lumber for the forty-stamp mi l of the G. M. G. M. Co. The camp is at present at a stand still, but I understand will open out with a new twenty-stamp mill in the spriog.

Bear valley is enclosed by continuons ranges of mountains, has a beautiful shallow lske at the south end of it, and is rapidly growing since the arrival of Mr. Gilson, who briogs the forty-stamp mill for the Gold Mountain gold mining company, aod under whose superintendency the mill is making rapid progress. The principal feature of this mining camp is the extraordinary cheapness of wood and water, and the easy access to the quartz rock.

The main belt of this district runs north and south, and I will endeavor to give your readers a faint idea of its extent. I will commence at the Rogers mine, the entire of the claim being situated in Jacoby Gulch, and owned by Sam Rogers, one of the oldest and considered one of the best miners in the State. The lead or lode in this mountain of quartz rock rnns about three miles in length and is from 1,000 to 2,500 feet in width. Some of your readers may think this incredible, but I have not only examined it but have prospected with a spoon and in almost every instance fonnd gold. I will merely give you the names of a few mines in this letter and will enter more fully into the particulars in the future. On the north of the Rogers mine are the Morrison, Valencia, Cynthia, Excelsior, Pidon, Hic Jacet, Big Tree, Omagh, and some others I have forgotten at present. On the south of the Rogers, on the same lead, are the Great Mogul and Mountain Chief.

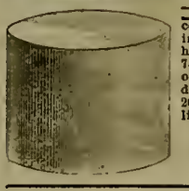
Improved Cast and Forged

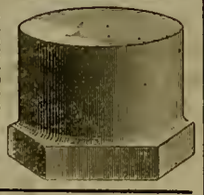
STEEL SHOES & DIES FOR QUARTZ MILLS.

[PATENTED MAY 26TH, 1874.]

To Superintendents of Quartz Mills and Mining Men Generally.

We guarantee these SHOES and DIES to do the work of four sets of iron and to be at least 10 per cent cheapor. They are gradnally coming into use in all of the principal mills on this coast.





Their advantages over iron are cheapness on first cost, increased crushing capacity, time saved in changing and in setting tappets, increased valna of amalgam hy absence of iron dnst and chippings, and a saving of 75 per cent. in freight. They possess a similar superiority that steel rails do over iron rails. It takes 40 days to fill orders from the manufactory East. Price 20 cents per pound shipped at San Francisco. Terms liberal.

Address all orders, with dimensioos, to

CAST STEEL SHOE & DIE CO.,

TEATS' PATENT FURNACE.

TEATS' PATENT FURNACE

For Roasting, Desulphurizing, Chloridizing and Oxidizing Ores, etc. For the reduction of Gold, Silver, Lead and other ores, saving a larger percentage, at less cost, than any other invention now in use. Chloridizing Silver ore more thoroughly, in less time, with less fuel, salt and labor; also roasting Lead ors preparatory to smelting, better and cheaper than any other invention. The Furnace is so constructed that one man, of ordinary ability, tends five or more furnaces; controls them with ease, adding heat or air; stopping or starting at will; charging and discharging with ease. Also, Patent "Conveying Cooler," for cooveying and cooliog roasted ores, heating the water for amalgamation and the boilers at the same time. Saving the large spacs in mill (covered with brick or iron), and the labor of two men per day, exposed to the poisonous chlorine gases. Also, Patent Air Blast "Dry Kiln," for drying ores direct from the mins or breaker, saving fuel and labor herstofore nscessary in drying ores for dry pulverizing. For description refer to MINING AND SCIENTIFIC PRESS, No. 18, October 31, 1874. For particulars address

DEWEY & CO.

American & Foreign Patent Agents,

OFFICE, 224 SANSOME STREET, S. F.

PATENTS obtained promptly; Caveats filed expeditiously; Patent reissues taken out; Assignments made and recorded in legal form; Copies of Patents and Assignments procured; Examinations of Patents made here and at Washington; Examinations made of Assignments recorded in Washington; Examinations ordered and reported by Telegraph; Rejected cases taken up and Patents obtained; Interferences Prosecuted; Opinions rendered regarding the validity of Patents and Assignments; every legitimate branch of Patent Agency Business promptly and thoroughly conducted.

Our intimate knowledge of the various inventions of this coast, and long practice in patent business, enable us to abundantly satisfy our patrons; and our success and business are constantly increasing.

The shrewdest and most experienced Inventors are found among our most steadfast friends and patrons, who fully appreciate our advantages in bringing valuable inventions to the notice of the public through the columns of our widely circulated, first-class journals—thereby facilitating their introduction, sale and popularity.

Foreign Patents.

In addition to American Patents, we secures with the assistance of co-operative agents, claims in all foreign countries which grant Patents, including Great Britain, France, Belgium, Prussia, Austria, Victoria, Peru, Russia, Spain, British India, Saxony, British Columbia, Canada, Norway, Sweden, Mexico, Victoria, Brazil, Bavaria, Holland, Denmark, Italy, Portugal, Cuba, Roman States, Wurtemberg, New Zealand, New South Wales, Queensland, Tasmania, Brazil, New Grenada, Chile, Argentine Republic, AND EVERY COUNTRY IN THE WORLD where Patents are obtainable.

No models are required in European countries, but the drawings and specifications should be prepared with thoroughness, by able persons who are familiar with the requirements and changes of foreign patent laws—agents who are reliable and permanently established.

Our schedule prices for obtaining foreign patents, in all cases, will always be as low, and in some instances lower, than those of any other responsible agency.

We *can and do* get foreign patents for inventors in the Pacific States from two to six months (according to the location of the country SOONER than any other agents.

Home Counsel.

Our long experience in obtaining patents for Inventors on this Coast has familiarized us with the character of most of the inventions already patented; hence we are frequently able to save our patrons the cost of a fruitless application by pointing them to the same thing already covered by a patent. We are always free to advise applicants of any knowledge we have of previous applications which will interfere with their obtaining a patent.

We invite the acquaintance of all parties connected with inventions and patent right business, believing that the mutual conference of legitimate business and professional men is mutual gain. Parties in doubt in regard to their rights as assignees of patents, or purchasers of patented articles, can often receive advice of importance to them from a short call at our office.

Remittances of money, made by individual inventors to the Government, sometimes miscarry, and it has repeatedly happened that applicants have not only lost their money, but their inventions also, from this cause and consequent delay. We hold ourselves responsible for all fees entrusted to our agency.

The principal portion of the patent business of this coast has been done, and is still being done, through our agency. We are familiar with, and have full records, of all former cases, and can more directly judge of the value and patentability of inventions discovered here than any other agents.

Situated so remote from the seat of government, delays are even more dangerous to the inventors of the Pacific Coast than to applicants in the Eastern States. Valuable patents may be lost by the extra time consumed in transmitting specifications from Eastern agencies back to this coast for the signature of the inventor.

Confidential.

We take great pains to preserve secrecy in all confidential matters, and applicants for patents can rest assured that their communications and business transactions will be held strictly confidential by us. Circulars free.

Engravings.

We have superior artists in our own office, and all facilities for producing fine and satisfactory illustrations of inventions and machinery, for newspaper, book, circular and other printed illustrations, and are always ready to assist patrons in bringing their valuable discoveries into practical and profitable use.

Cazin's Combination Ore-Sizer and Concentrator—One Plunger System.

[Covered by Letters Patent of July 2d, 1872, and recent applications.]

Containing a sizing apparatus, (revolving screen) delivering two or four sizes of ore to two or four rows of sieves, each row independent of the other, and each having 5 sieves, each row concentrating according to specific gravity the special size automatically fed unto it, resulting in the simultaneous continual delivery of separated materials, working 2d and 3d-class ores into 1st-class ores of perfect cleanness. It thoroughly separates native gold or copper from quartz or any other lode matter;—galena and silver sulphurets from pyrites, baryta and quartz; and pyrites from quartz.

Added to a battery of stamps these machines constitute a full system of ore concentration, sufficient in most cases for the requirements of western mines, with a capacity of 15 or 20 tons per 24 hours.

For particulars apply to,

F. CAZIN, M. & C. E.
Supt. Denver Concentration and Smelting Co.,

At Denver, Colorado, Lock-Box 2225, or corner of Blake and 32d streets. ag3-16p

A Good Binder for $1.50.

Subscribers for this journal can obtain our Patent Elastic Newspaper File Holder and Binder for $1.50—containing gilt title of the paper on the cover. It preserves the papers completely and in such shape that they may be quickly fastened and retained in book form at the end of the volume, and the binder (which is very durable) used continuously for subsequent volumes. Post paid, 25 cts. extra. It can be used for Harper's Weekly and other papers of similar size. If not entirely pleased, purchasers may return them within 30 days. Just the thing for libraries and reading rooms, and all who wish to file the PRESS. 1amhp

Thursday Noon our last forms go to press. Communications should be received a week in advance and advertisements as early in the week as possible.

MINING AND SCIENTIFIC PRESS.

An Illustrated Journal of Mining, Popular Science and General News.

BY DEWEY & CO., Patent Solicitors.

SAN FRANCISCO, SATURDAY, NOVEMBER 21, 1874.

VOLUME XXIX Number 21.

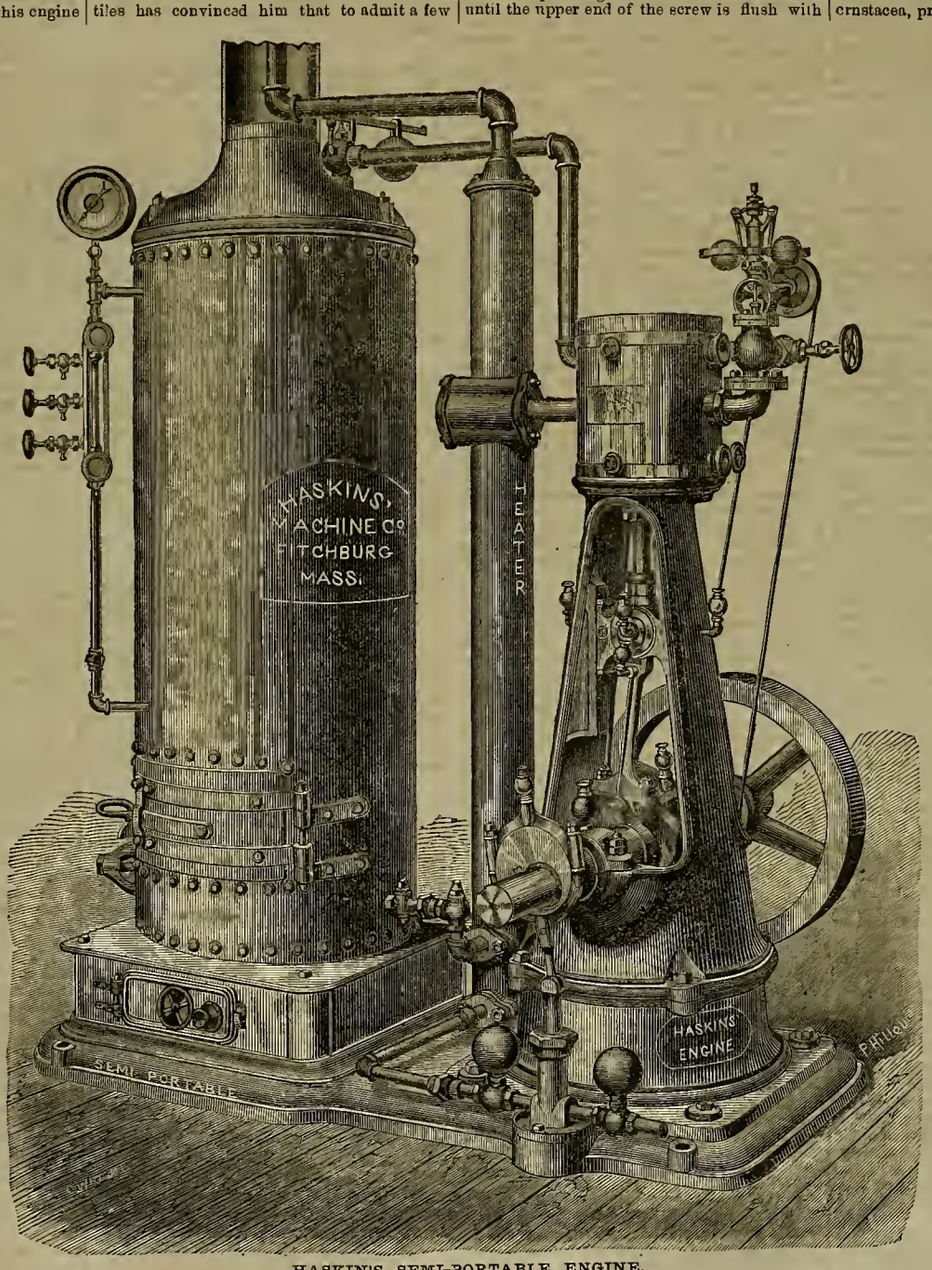
The Haskins Steam Engine.

The accompanying illnstration represents a semi-portahle engine of 10 horse-power, made by the Haskins Machine Co., for which Parke & Lacy, No. — Leidesdorff street, San Francisco, are agents. It is claimed for this engine that aside from this perfect system of mannfactnre, it has many points of excellence. One of these points is claimed to be its genoral ontline. It will be noticed that all strains are met by straight lincs, rather than cnrved ones which are regarded as elements of weskness. The valves used on these engines are the "piston valves" of Thomas S. Davis, long the snperintendent and msnager of the Jersey City Locomotive Works—which, though first constrncted and patented some ten years since, have stood the test of time thoronghly and successfnlly.

On small engines, nnless specially ordered otherwise, the valves are made to cut off at a point predetermined; on others, an sutomatic "cnt-off," controlled hy the governor, is applied, insuring efficiency equal to the hest.

For driving the valve the nsual eccentric is made nse of, with the exception of its mode of constrnction and adantation to this psrticnlar engine. It is msde fast on the shaft, permanently, not with set screws or keys, but is made an integral portion of the shaft, snd then, on its periphery is "shrunk" a reinforcing ring which is hsrdened and can he replaced in case of accident to its surface. No place is left for any adjustment of valve motion. Every part is made the exact length desired and pinned fast. No sorew or nut can be changed to alter the desired results. Thns is the perfection sought permsnently secured; for, so soon ss s change is allowed in the valve motion of an engine, jnst so soon are the resnlts of the originsl engineering skill lost. The main shaft, the connecting rod, and all other hoxes are composition, lined with best Babhit metal, and sre made interchangeable. Their wear does not therefore affect the framing or lining of the engine. The connecting rod and its pins are very large at the bearing points. The cross head is provided with adjnstahle composition gihs of very large surface snd self-centering. The piston rods and all the parts that reqnire it are of the hest steel.

A neat and efficient plan of getting rid of drip water from the cylinder is peculiar to this engine. The device is contained heneath the jacket. When in use the drip water passes down inside the post and ont of the hase, and it can thus he carried off to the sewer, without in the least soiling the floor.



HASKIN'S SEMI-PORTABLE ENGINE.

THE engineer of the Imperial mine was killed on Wednesday last. He was standing at the engine hoisting a cage np the shsft, when the cable broke and the upper section was hurled with great force against him, striking his hreast and knocking him down. He lived only a few minntes.

Illuminating Tiles.

Mr. William Lynch of this city is determined to provide proper means for lighting and ventilsting dark and unssvory places. A large experience in the mannfactnre of illnminating tiles has convinced him that to admit a few straggling sunbeams into an underground apartment will not purify the atmosphere or render it a healthy abode, neither will it prevent articles stored in snch apartments from heing affected by the dampness and closeness of the atmosphere. A short time since we described in the columns of this paper, an improved ventilating blank to be used alternately with the ordinary illuminating hlank in the manufacture of illuminating tiles which was patented hy Mr. Lynch. We now report the issnance of another patent obtained hy Mr. Lynch through the MINING ANN SCIENTIFIC PRESS Patent Agency, for an improvement in connection with those ventilating blanks. His present invention consists in tapping the hole in the ventilating blank with screw threads and adapting thereto a short screw which can bo scrowed np through the hold from underneath until the upper end of the screw is flush with the top of the blank, thus effectually closing the hlank in wet or frosty westher in order to keen the illuminated apartment dry.

Mr. Lynch is desirous of disposing of rights nnder said pstents. For particnlars, address Wm. Lynch, in care of this office.

COAL STOCK.—They talk of a coal stock hoard in Oakland now. They had better depend on their mines for their profits, than on stock transactions. People will have more confidence in the mines if they stick to legitimate mining.

Academy of Sciences.

The regular semi-monthly meeting of the Californis Academy of Sciences wss held on Mondsy evening last. The contributions to the mnsenm embraced a nnmerons collection of crnstacea, principally from the cosst of Japan, presented by Captain J. W. Fisher, of the United States Coast Survey; a specimen of the Foolish Guillemot, s sea bird common on the northwest cosst (this specimen being the only one known to have been canght on the coast of California), presented hy W. G. Blnnt; a specimen of the wood dnck fsmily designated *Anass ponsa*, heautifully mounted in a glass case, presented hy W. C. Reiter, M. D., of Pittsburgh, Penn.; specimens of the Chætodon, a onrions species of snn-fish, found in the Californis waters, presented hy T. R. Crnssea; specimens of the volcanic ashes from the recent volcsno in Plumas connty, described hy Dr. Hsrkness at the last meeting of the Acsdemy, presented hy that gentlemsn; photographs of Indian skulls, presented by Bradley & Rnlofson.

A new species of shell found in San Francisco hay was presented by Dr. Newcomh, with a technical descriptive paper.

Dr. Hsrkness presented a written report on his recent explorations in Plnmss county, particularly describing a recently extinct volcsno, and a lske snpposed to he of the highest sltitnde of any considersble body of water in North America. This is referred to at length in another column.

Mr. Lockington resd a paper describing new species of crustaces, snd Mr. Fisher read one dcscribing a now species of polyp. Both these pspers were technicsl.

Dr. J. G. Cooper read a psper on "The Eocene Epoch in California," which we shall give in onr next issue. He also called the attention of the Academy to the prognostications of a cold and dry winter, particularly in the early appearance of Arctic hirds in this latitnde, including some varieties thst were rarely seen as far south.

Dr. Blake resd a very valusble psper on the hest varieties of grspe adapted to wine making in California. He has made exhanstive experiments on the prices of different grapes with a view to determine the hest quality. We shsll give this psper in onr fntnre issne.

It wss thonght thst Dr. Harkness wss too modest in naming the lake discovered hy him in Plumas connty after Livingstone, and it wss resolved to name it "Lake Harkness." Dr. Livingstone already has one lake named after him in Africa.

IMPROVED HARROW. — Frank Donohue, of Mayfield, Cal., has recently patented an invention which relates to an improved harrow, and consists in so constrncting a componnd or double harrow, that the onter corners will hug the gronnd at all times, without using a weight or other contrivance to keep them down. Each section of the harrow he constructs in the shape of a rhomhoid. The hinges which connect the sections together are plsced on opposite sides of the line of dranght, by a pecnliar constrnction of the harrow, thns causing the weight of the corners or acnte angles to be nearly at right angles to the breaking line or joints of the two hinges, so that their superior leverage, owing to their greater distance from the hinges, will cause them to keep closely down to the gronnd.

Treatment of Lead by Steam.

M. Rozsu says in place of stirring the molten lead, eithsr by hand or by steam power, steam is introdnced and csuses a violent and oontinued boiling of the whole mass of metal in fusion, most favorable to the sepsration of the silver from the lead, and the purification of tho lattsr.

The above action is, of course, purely mechanicsl. As to its chemical sction, although feeble, on account of its being in the presence of metals which do not become decompossd at the tempsrsture at which tbe operstions are csrried on, thst is to ssy, about 330 degs. centigrade, it ie sensibly felt, for ths lead undergoes a refining sction indepsndent of tbat which results from its fusion at a dull red hest previous to crystallizstion, so much so that sll previous refining is dispensed with in the csse of modsrately hard lsad, though not when the metal is very hsrd.

If the chemical action of the steam wers *nil*, the purity of the lesd produced without previous rsfining could only he attrihuted to ths series of partial rsfining to which the lead is suhmitted, by ths fsct of a great nnmber of remeltings st a dull heat; but a fact which tsnds to show that the steam exercises a chemicsl sction is thst the oxides which are produced are yellowish snd earthy, but as the operstion proceeds, become hlack and heavily charged with copper, a circumstance which is not produced in the boilers of the ordinsry system in spite of the most vigorous stirring.

Toward the end of the operation, while the stesm is still in action, in the liquid portion in which are concentrated the silver, copper, antimony and arsenic, the lead is found to hsve been deprived of the copper which it contained. The antimony is gradually eliminated by the oxidation caused hy the air during the remeltings; soft lead gives even more oxide than hard lead contaiuing more antimony, which proves that the latter oxidizes first and preserves the lesd from oxidization.

The lesd produced by the steam method is perfectly soft, and beside a suppression of a special operation of refining, the employment of steam offers many advantages, as the saving of the cost of previous purification, reduction of oxidation of the lead, and consequently of waste. The economy ot time aud labor is due to the rapidity ot the operation, the smaller number of hands required, while superior workmen are necessary in the old system than in the preeent, and also more space.

When the lead to be dealt with contains not more than one-half per cent. of autimony, it may be operated upon hy the new system directly, and the purification becomes reduced to that of the rich dross, and the expense to about one-fifth the ordinary mode.

In the case of lead which contains a larger amount of autimony, previous purification is necessery, but this operation ueed not be carried so far es in the ordinary process; it may he arrested when only half per cent. of antimony remains in the lead. The arsenic having the greatest tendency to take the place of the silver, it has heen proposed to effect the purification hy means of sode.

The apparatus employed in the steam system consiste of an upper and lower boiler, each with its own furnace; the former, for the melting of the lesd and separating the eilver, will contsin about nine or ten tons, and the latter, which is for the crystallization, from fifteen to sixteen tons. A stage erected around the lower boiler allows the workmen to watch the operation and remove the oxides. The metel is run from the upper to the lower vessel through tubes fitted with fricion valves moved by mesns of a lever; and in order to prevent the leed from penetrating into the steamway pipe, a valve cock is sdopted.

The lead having heen melted in the upper hoiler is skimmed and run off into the lower one, and at that moment a small jet of steam is let in to effect the mixture of the crystals of the previous operation with the lead in fusion. A small stream of water throwu upon the surface of the lead at the commencement of the operation facilitates the formation of the orystals. The steam is introduced from a hoiler close at hand, uuder the pressure of three atmospheres, through a lateral tuhe near the bottom of the lower boiler, and is distributed uniformly hy means of a horizontal disc of cast iron placed over the nozzle of the steam pipe in the center of the lower part of the boiler. The hoiler is fitted with a cover in segments, which are opeued alternstely every five or six minutes, when a workman detaches such lead as has heen flung by the action of the escaping steam against the upper sides of the hoiler, and adhered there. Beneath the boiler are two small supplementary furuaces, which hring up the discharge tubes to the proper temperature, and are lighted just previous to the drawing off.

The workmen remove the oxides once only during the operatiou, betore the introduction of the stesm, but the top of the boiler is fitted with a chimney which places it in communication with the condensatiou chsmhers, where the steam arrives, carrying with it a part of the oxides, which are deposited in a pssty state.

The lead is run off when about two-thirds are in the state of crystals; the lead is received in couical vessels sunk in the grouud, the metal ways being furnished with gratings to keep back any crystals. Two pigs of 2½ tons eaoh are produced at each operation. The pigs obtained from successive operations are lifted by a steam crane aud arranged according to their quality, and those of superior quality are collected together until the quantity is large enough to commence a new eeries of operations, starting from the point reached in the former. When the lower hoiler is run off, the lead which has bean meltsd in the upper one dnring the cryetallizstion is turned into the former, and the operation is repeated.

When merchant lead or complemsntary lead are in a state of crystals, these sre melted by lighting ths furnace under the lower boiler, and the lesd is run off into ingots plsced in a balf circls, and filled by means of a gutter running upon a pivot.

Tbe word "operstion" is spplisd to the total of the work done hetween the drawing off the lead from the uppsr hoiler into the lower aud tbe running of the enriched lead into ingots. The time ot an operation is one hour snd a half. Tbe running of the merchsnt or complementary lesd counts for two operations, becsuse the time necessary for the melting of the crystals in the lower boiler is nearly douhle that occupied by the crystsllization, Ths number of operations representing this runuing is, for lead of 125 grsmmes, 24 to 30 psr cent. of the number of crystallizstion. The number of operations is, on an avsrage, 13 in 24 hours, but it sometimes amounts to 16 or 17, according to the nature of the fuel, the draught and ths proximity of the steam hoiler; it varies slso with the tenure. An apparatus dealing with lesd of 123 grammes produces 6 or 7 tons of merchant lead per 24 hours.—*La Metallurgie.*

Mining Prospects on the Comstock.

Never in the history of the Comstock did mining prospects sppear hetter thau at present. Recent developments at the nortbern end of the lode bid fair to equal in richness those of the Belcher snd Crown Point, and the time when the mines of Washoe ehall give out has been indefinitely postponed. Persons who have recently visited the Ophir, California, and especially the Consolidated Virginis, have heen astonished at the future prosperity of these mines, which is discernihle even to a casual observer. A well-known mining expert from San Francisco, who has been in this city examining the different mines for the last two weeks and retnrned home a day or two since, reported to his principals on his arrival that, so far from the Comstock being exheusted, the indications of its permanence and inexhaustible extent were greater to-day than at any previous period in its hietory. He stated that from what he had seen he was satisfied that the lode would not be worked out for 50 years, that the yield of bullion would increase annually, and that the Comstock would only be abandoned when the shafts had reached as great a depth as it was possible to penetrate into the bowels of the earth by modern machinery and engineering. This opinion is amply substantiated hy facts, and the present and future permanence and prosperity of this city aud Gold Hill are beyond all peradventure. Sagacious inve-tors do not hesitate to erect large and substantial buildings which would he a credit to any commercial metropolie in the country, knowing at the same time that if the mines should fail these very edifices would soon become the domicile of owls and bats, and Virginia City one of the things that were. There is no city of its size in the United States which combines elements of greater wealth .han are combined in the one source from which Virginia draws its sustenance, namely—the mines. The so-called rich meu in many towns of twice the population would stand agbast at the millions which some of our wealthy capitalists can roll up, and laborers end artisans find no place in the whole country where their work is better remunerated. And this state of affairs is destined to continue. The sudden fluctuations of 10 or 12 years ago, the hopes entertained hy the owners of outside claims of the fabulous richness of their properties, and the days of wildcat, are abont over. The business of the country has come down to a regular and permanent basis, hnt it is a hasis of ever-increasing prosperity, wbich, from present indicetions, hut few persons now liviog aloug the line of the Comstock will live to see fail.—*Enterprise.*

Saver of Fuel.—Harry Strout, manager of the Hoosac Smelting Works, says the Eureka *Sentinel*, has had one of the patent coil heatere from the Stockton Iron Works, put in position at his works, which already demoustrates its utility in saving fuel. Formerly it took three cords of wood each 24 hours to keep the water in the boiler at a proper heat; but hy the above appliance it now requires hut one cord for the same length of time. The new heater receives the exhausted steam from the engine, which is forced into the boiler at a temperature of over 200 degrees, and only sufficient fire is required under the boiler to mske the additional 12 pounds, a temperature of 212 degrees making stsam. The machine is the iuventiou of R. V. Hauks, now engineer at the above works, who has sold his patent to the Stockton Iron Works. The invention is in every way a valuable one, causing a saving of two-thirds of the amonut of fuel otherwise required.

Seven-Eighths of all the brass and German silver made and consumed in the United States, together with one-helf of the manufactured copper, is made in Little Naugatuck valley, Ct., which is not over 30 miles long. The annual consumption of copper by the twelve hrass and copper mills located in the vslley is not less than sixteen millions of pounds—more than one-half of the product of the copper mines of the conntry.

Owners of the Pine Flat Quicksilver Mines.

In a long article on the quicksilver mines, we find the following in the Petaluma *Argus* concsrning the ownership of prominsnt mines: A visit to the diffsrsnt mines was an agreeable task. It is estimsted thst 1,000 men are employed in working snd prospecting in snd about Pine Flat. We append below the names, owners, superintsndents, etc., of the more promising mines in tbat locality.

Annie Belcher,

Located about one mile and a half from Pine Flat. The superintsndent, Matt D. Carr, an old newspsper man, has shown his ability to superintend a mine as wsll as publish a newspsper. He was formerly conuected with the Marysville *Express*, a paper thst he published fourteen years. He is just erecting upon the Annie Belcher a thres-quarter Knox & Osborne furnsce that will he completed in about fifteen days. The mine is very promising.

Georgia.

Two miles from Pine Flst is the Georgia, ownsd by the Thompson Brothsrs, thst gives promise of proving one of the richest in the district. They have 150 tons of ore out, and are waiting to run it through the Annie Belcher furnace. The proprietors are deserving of a rich mine.

Edith.

This mine is located four miles from Pine Flst. It wss formerly known ss the Bscon, and is very promising. Wm. Pascoe, the superintendent, is a very clever and competent man.

Socrates.

Two miles from Pine Flst, on the Geyser Rosd. This mine wss kuown formerly as the Pioneer, snd was at one time sold to a New York compsny for $800,000. The present owners have been offered $300,000 for it. Sixteen men sre employed, and the company are surveying at present for their furnaces. W. S. Bell, the superintendent, has been in the locality eight years. The compsny will be at work with their furneces in the spring.

Sonoma,

Location three miles northwest from Pine Flat. The owners are General Dodge and others, of San Francisco. The mine has a fifteen-ton Luckhardt & Riotte furnace, and yields about $4,000 per month. Mr. Clark, lately connected with the Knoxville mines, is superintendent.

Rattlesnake,

Situated two miles northwest from Sonoma, is owned by Parrott, Lightner Bros., Robert Morrow, Adem Graut, Wm. Burling and others, all of Sau Francisco. The superintendent is B. P. DeNoon, en experienced miner. Oue hundred and twenty men are employed. The company have a fifteen-ton Luckhardt furnace, and have just commenced reducing. They bave one shaft in 200 feet and have 2,000 tons of ore in adobes under cover.

Missouri

Is located about seven miles from Pine Flat. The owners are Wm. A. Stewart, Aloxander Elder, W. S. Bartlett, G. P. Kellogg, Dr. R. J. Chase, W. P. Littleton, Thomas Bowen, Frank Frank Adams, James F. Stuart, et al. The Superintendent is J. B. V. Confert; foreman, Abraham Waters. The company have five retorts, but only two working. The yield of the mine is $3,000 per month. Several shafts and tunnels have heeu put in, and the mine thoronghly developed. We stopped over night at this mine, and return thanks to the superintendent aud foreman for favors extended.

Oakland,

Or what was formerly known as the "Lost Ledge," is just below the Missouri. The owners ere Forman, Show & Taylor, of the Eureka Consolidated mining company, San Francisco, Wm. A. Stuart, Alex. Elder and others. Superintendent, J. L. Cook. The company have six retorts, and the mine yields $225 a day, and thirty-seven men are employed.

Geyser,

Immediately below the Oakland. Owners, Edgar Mills and G. W. Gilbert of Sacramento; Hoyt & Sears, Flood & O'Brien, Wm. A Stuart and Alex. Elder and others of San Francisco. The superintendent is W. H. Rhoda; foremsn, Stephen Conkling. The company are just building a fifteen-ton Knox & Oshorne furnace.

Mercury.

Same owners as the Geyser, aud same superintendent. A very promising mine.

Kentuck,

Owners, L. H. Hopkins, John Cyruss, Wm. A. Stewart, Alex. Elder et al. This mine is prospecting well and is superintended by J. V. C. Comfert.

A Miner in Luck.—Wm. McLaughlin, a miner of this city, left last night for Scotland, his native country, with the snug little sum of $20,000 realized in a few months in mining stocks. Some of our miners who are worth from $30,000 to $50,000 are still pegging away in the lower levels. They want just a few dollars more.—*Virginia Enterprise.*

Mr. Stanley's special mission to Africa has begun well. He writes that he bas been pleasantly received by the Sultan of Zanzihsr, and was actively engaged in completiug preparations for his journey to the intsrior of the continent.

How Miners Brave the Perils of the Lower Levels.

Those of the men burned at the time of the late terrible firs in the Belcher air shaft, who are still living, are getting along finely and some of thsm will be able to he out in a few days.

We were present when they went into the mine that fearful day. At the moment when thsy descended a column of flame was darting upward to the higbt of 60 or 80 feet above the mouth of the burning air sbaft.

Tbs men went down the main working shsft, upon the roof of the huilding, covering which was falling a psrfect shower of live coals and burning cinders.

A lsrge rope had bsen stretched around the mouth of the sbaft at the distance of 15 or 20 feet in order to keep back the tbrong of outsiders. Inside of this rope were standing 30 or 40 miners.

The csgs, a three-decksr, came up from the lower lsvsls, and upon the lowsr deck stood an underground foreman. As the cage stopped the forsman ssid: "I wsnt 18 men to go down to the 1,000-ft. level with me."

The men knew that on the level mentioned wss the hottom of the perpendicular portion of the hurning sir shsft, but they did not know the situation at that point, nor did they know what they would be asked to do on arriving at their destination. Yet no sooner had the call for volunteers been made thsn there was a perfect rush of men to the oage.

The lower compartmeut was instsntly filled. The engineer, who stood with his hand on the lever ot his engine, dropped the cage until the next compsrtment was level with the floor, and this had no sooner been done than it was filled with men, and the same was the case as the last compsrtment came down; indeed, there wss a struggle among the men for a plaoe ou the cage, tuough not a word was said.

The men were sll brsve, determined-looking fellows. They all wore calm, firm faces—not a cheek was pale.

As the men were taking their places on the cage we called the attention of a gentleman of Gold Hill to them, and said: "Those are all fine, hsve men. See with what nerve they step upon thet cage to go down into the burning mine! It may be," continued we, "that some of those men will never reach the surface alive, yet not one ehows a sign of fesrl"

"Very true," said our friend, "hnt I don't think there is any real danger down there. The fire is confined to the air-shsft—all around it is safe enough."

Said we: "Men never go into a mine at auy time but they are in danger, and when there is anything wrong in a miue the danger is vastly increased—particularly when there is a fire in any of the lower levels."

"Well, but what can happen to these meu?" asked our triend.

"These men," said we, "will probably come out all right if no cave shall occur in the turning shaft while they are below; hut it is now about time for caving to begin."

Our fesr was that a cave would occur which would completely close np the shaft and suddenly drive the poisonous gases through the lower levels.

Lesving the shaft and the works shortly after the men disappeared on their dangerons mission to the bottom of the burning mine, one thonsand feet below the eurface of the earth, we retnrned to the town of Gold Hill.

As we entered Main street, we turned and looked in the direotion of the burning shaft. No sign of flame was visible there, hut up from the mouth of the shaft rolled a tremendous volume of inky smoke.

Said our companion: "The fire is gone out! See! It is all smoke now!"

"There has been a cave in the shaft!" said we.

In about half a minute the volume of flame agsin darted into the eir from the mouth of the shaft and instantly all the smoke disappesred.

It was at the time the smoke was rolling up from the shsft that the nine meu were writhing in the flames in the drift on the 1,000-ft level. The cave in the shsft had forced in upon them a sea of fire. When the column of flame agaiu appeered at the mouth of the shaft, was when it returned from the drift and resumed its natural course up the shaft. After this first cave there were several smaller ones, when for a half miuute or more smoke again rolled up from the shaft.

Nine of the 18 men we saw so bravely descend into the burning mine came up scarred and crisped; their clothes burned from their bodies and the skin peeling off in great flakes wherever they were touched.

When men are going into mines at such times of peril, it may he said, "O, there is really no danger!" hut it is only brave men that go to see whether or not there is danger—that go and take all the chances.—*Enterprise.*

The Oroville *Mercury* of the 18th inst. ststs: The Chiuamen are quietly huying up all the odd pieces of mining ground to be found in this part of the country that they can get ohesp. They are taking out a large amount of dust eaoh week. While there is less excitement than when the mines were first struck, there is a great deal of work done and good pay received for it. There are now about 4,000 Chinamen at work in the Lava Beds below towu, aud all seem to be doing well.

MECHANICAL PROGRESS.

Glass-Lined Tanks and Cisterns.

We have recently examined the application of an idea which may solve a difficulty felt in many trades. Mr. Hartley, a brewer, of Ormskirk, has suggested the use of a lining of glass to the vats employed for the fermentation of liquors, and has patented a means for attaching plates of glass to iron or other materials commonly used for the construction of such vats. The idea arose from his own requirements, as there is considerable difficulty experienced in perfectly cleansing wood, stone or slate, from the germs of organisms which accompany or induce putrefaction. With glass there is no such difficulty, and especially where no elevation of temperature is necessary this device of Mr. Hartley's appears to be satisfactory. The strength necessary to contain large bulks of liquid is of course given by the wood or iron basis of the vessel, while cleanliness is secured by the lining, which in many cases may be ordinary window glass, and in none need exceed three-eighths of an inch in thickness. Although primarily intended for the use of brewers, we do not see why the use of glass linings should not be extended, and it is likely to prove very valuable for house cisterns, as besides being more cleanly. A wooden cistern, glass-lined would probably cost much less than a zinc or leaden one, and offer no chance of corrosion or contamination.—*Iron.*

A Striking Sundial.—A sundial that strikes the hours is not seen every day, and many persons will doubt whether such a thing has ever had an existence. A dial of this description, however, has been invented and constructed by Abbe Allegret. It is simply a modification of what is termed the solar counter for registering the times at which the sun shines or is obscured. To effect this there are two balls—one black and the other yellow—fixed at opposite ends of a lever sustained by a central pivot. When the sun shines the black ball absorbs more heat than the yellow one, and the vapor of a liquid contained in the former is elevated to a higher temperature than that in the latter. As a result the vapor leaves the one ball, and being condensed in the other, this becomes the heavier, overbalances the equilibriam, and in doing so sets free a weight, giving motion to the requisite clockwork. In the sundial referred to, a pair of these balls is fixed at every hour-mark. When the shadow of the gnomon reaches any particular hour mark one of the balls is shaded, a preponderance of liquid enters the ball, the lever tilts, the mechanism is set going, and a gong sounded as many times as the number of the hour to be indicated. Of course, the sun must shine at the time of the hour mark being passed by the shadow, or the time will not be struck.—*Iron.*

Ironclad Vessels.—The invention of iron plates to protect vessels is far from being of as recent date as is generally supposed. During the 12th century, the Normans covered their ships from the water line up with an iron casing, terminating with a ram on the bow. Still earlier they had adopted a system of protecting the upper works with metal shields. In 1534 Peter of Arragon ordered his ships to be iron-plated, in order to protect them from the burning missiles then in common use. In 1530 the squadron of Andrea Doria contained a vessel built by the Knights of St. John, which was armored with several thicknesses of iron. At the battle of Lepanto several ships protected thier batteries with bars of iron. For two centuries no progress seems to have been made. In 1782, at the siege of Gibraltar, an engineer officer constructed six ships, which were the types of the modern ironclad. They were covered with an armor of hard wood, leather and bar iron. It is said that they resisted the fire of the forts for a long period, but were finally sunk by red hot shot.

Improvement in Saws.—Messrs. Branch, Crookes & Co., of St. Louis, are introducing a novelty in saws, invented by Mr. J. W. Branch, which is thus described: The inventor takes a circular saw plate and inserts about thirty small pieces of steel or iron in which is imbedded a bort or black diamond. The small pieces thus inserted are made fast by a steel rivet to the saw disc. The circular plate is 60 inches in diameter, holds 30 diamonds equidistant around its edge, and is capable of making over 650 revolutions per minute. This plate is affixed in the same manner as a regular circular saw for wood work, but has a rubber pipe fixed in such a manner that a spray of water is running on the side, edge and in front of the blade as it revolves, and answers the double purpose for cooling the saw blade and wetting the stone. The saw is fixed above a bedplate which has a feed movement with head blocks on rollers. The apparatus is portable and can be set up in quarries, as well as in shops and stone yards.

Cane Fiber for Felt.—A company in Virginia are manufactnring from cane fiber an article of felt which is said to be cheap, durable, impenetrable by rain or moisture, and a non-conductor of heat and cold. It is made either plain or resin-sized, and in either case is free from odor. As a lining under tin, slate or shingle roofs, or for deafening floors or lining carpets, or as a substitute for plaster, it is claimed to possess important advantages over the felt in ordinary use.

Sand Paper.—Formerly it was customary for the trades using sand paper constantly to make it for themselves as they needed it, ont of ordinary brown paper, glue and sand, as is done even yet in some parts of Europe. This business is now thoroughly organized in the United States. The paper is made of old rope, the best quality of glue is used, and, instead of sand, pulverized quartz or flint. By this means a superior article is produced, of a constantly uniform grade, at so low a price that the demand for it has become universal, large quantities being exported to Europe, South America, the Pacific Islands, and elsewhere. The amount made in the United States is very large, amounting to about 200,000 reams yearly, requiring a capital of at least $500,000. For emery paper and emery cloth a large demand has been created by the finished iron work in the steam engine shops, the sewing machine factories, and other similar industries which require them for polishing purposes.

Silent Fan-Blowers and Exhausters.—One of the defects of some fan-blowers is the howling noise they produced, which to some people is a real annoyance, especially when this noise is added to the other noises unavoidable in a machineshop or foundry. All will welcome, therefore, a new style of blower introduced by Van Brocklin & Aland, of Rome, Oneida county, New York, and which is perfectly silent. It takes the wind in at the center around the axis, like other blowers, but there is this difference, that if there is any excess of air which cannot be discharged through the blast pipe, it is discharged inwardly around the center opening, so as to inject air at an increased pressure into the center of the fan, thus forming a suction around the axis and increasing the supply and consequently the power of the blast.

An Ingenious Invention.—Mr. Atkins, Burmingham, England, has invented a process which admits of the filling of articles of brass with molten iron. The balance weights for chandeliers, pillers, columns and imperial weights may be made, advantage being taken of this process, at a much diminished cost. It is simply necessary to immerse the brass shells in water, and the molten iron is then poured in. The shell cannot, of course, obtain a higher temperature than 212 degrees, the boiling point of water, while the temperature of its contents may be about 3,000 degrees. In making imperial weights the shells are imbedded in iron filings, the high conducting power of which is thus turned to account. This process, simple though it be, is, from a commercial point of view, one of great importance as will be readily understood.

Instantaneous Extinguishment of Street Lamps.—The simultaneous lighting and extinguishment of street lamps is now effected by a very simple contrivance of some Belgian engineers. This is accomplished by affixing to the lamps an apparatus which is affected by the increased pressure of the gas at the gasometer, which is usually applied at the hour of lighting, and when in the morning the pressure is diminished at the main the gas can be either totally extinguished or let down to a mere thread. The lamp lighter of to-day may not be grateful to science for the disclosures; but it will be no less acceptable to the general public, for the effect of illuminating the streets and squares of a large city in an instant, without the apparent agency of man, would be magical indeed.

Alloys of Iron with Manganese.—The Terre-Noire, La Voulte and Bességes Iron Co. thus describe their improvements: With the following mixture: oxide of iron, 100; oxide of manganese, 750; lime, 20; oil, 500, a metal is produced containing from 75 to 80 per cent. of manganese, and a slag composed of the following: Silica, 12·2; aluminum, 3·7; lime, 7·1; barytes, 21; protoxide of manganese, 56. By increasing still further the proportion of oxide of manganese in the bath of metal, as much as 82 or 83 per cent. may be obtained; but a long time is required for its reduction, and the investigation into alloys so rich as this, has not the same interest.

Glycerine Instead of Steam.—An invention is now on exhibition in Liverpool by which oil or glycerine is made to perform the functions of steam by the same means—application of heat—which expands the oil placed in small cylinders, from which it is claimed a pressure of ten thousand pounds per square inch may be obtained without the danger of steam explosions, which prevents using a pressure of more than two hundred pounds to the square inch generally. In this instance an explosion would only crack the cylinder containing the oil, it is claimed. The application of this process has been made to the printing press and a punching and riveting machine, which are on exhibition.

A New Compound of Iron.—C. Burgess, of Portsmouth, Ohio, claims that by a mixture of fine cast iron with soft, gray cast iron he can make a new compound iron specially suitable for chilled or ordinary castings. By the adaptation of an ordinary gas puddling, closed or reverberatory furnace, and the employment of mineral coal therein, he produces a fine or partially refined cast iron for use in the foregoing process, and by a further continuation of the fining process he claims to convert cast iron direct into steel, in a common puddling or other suitable furnace, effectively and economically.

Ancient Use of Concrete.—Concrete was much used by the ancients, both as a foundation for roads and buildings, and for the interior of the walls of the latter. In some important instances, indeed, the walls were wholly composed of this artificial substance, but as it mainly consisted of lime, there was the drawback of the length of time it took to harden. The discovery in recent times of Roman, and better still of Portland cement, both of which set in a few hours, renders the use of concrete capable of great extension; and Mr. Hooper states that with the aid of the latter he has erected many buildings which promise to outlast those of equal size of any other material. The material is very suitable for fire-proof construction.—*Iron.*

Utilizing Waste.—It is said that the manufacture of mortar, beton and concrete, from the waste lime of gas purifiers—a discovery or invention announced only a short time ago—has already commenced on an extensive scale in England. The method of thus utilizing what has hitherto been considered an almost worthless refuse, consists, in this case, of simply grinding it up in an ordinary mortar mill or mixing it as common lime with sand, ashes, and similar material. The addition of Portland cement to the mixture is found to render the product—brick, slabs, etc.,—much harder.

A Monster American Locomotive.—The Pennsylvania Railroad Company claims to own the largest locomotive in the United States. She has twelve driving wheels and weighs 75 tons.

SCIENTIFIC PROGRESS.

American Weather Forecasts.—Mr. R. A. Proctor, who has lately been in America, speaks highly of the success of the Americans in weather prediction, which was discontinued in England after the death of Admiral Fitzroy. "The American papers publish daily, both in the morning and afternoon, the 'probabilities' as to the weather for the different sections of the eastern half of the United States. These announcements are now singularly accurate, the percentage of error being little more than ten or twelve, and constantly diminishing. Judging from all I heard, I believe that, notwithstanding the westerly situation of the British Isles with respect to the eastern continent, the system might be successfully introduced here. Of its success in America I can speak from experience. The probable weather for each day was a matter of considerable interest to me during my stay, especially during its latter half, as it chanced that I lectured nearly every day for the last three months of my stay in America (sometimes twice). I can only recall two occasions during all that time when the weather announcements were not strictly fulfilled by the event, and even in those cases the error consisted only in the announcement of a change in the weather a few hours before it actually occurred."

Rusting of Iron.—At a recent meeting of the American Association for the Advancement of Science, Professor S. S. Haldeman, of Harrisburg, Pennsylvania, read a paper, of which the following is an abstract: When railroad bars are piled beside a road they soon become rusted, while those forming the track are but little subject to oxidation; and when a rain of some hours' duration falls upon rails when in a state of rest, as upon Sunday, when trains do not run, they soon exhibit rust. This would seem to indicate that in chemical combination mechanical vibrations may interfere with the molecular arrangement of the elements. The accuracy of these casual observations should, however, be submitted to the test of experiment. In the discussion which followed this brief communication it was suggested that possibly the oil employed upon locomotives might be more or less spread in a thin film over the rails in use, and thus prevent their oxidation. This view was earnestly combated by other speakers. Professor Van der Weyde was quite certain that the suggestion of Prof Haldeman bore reference to a fact in physics. Molecular vibrations tended to prevent rust. A saw hung up, unused, would soon become rusty; if used, would keep bright. This was a general experience with tools.

Effect of Hydrogen in Impairing the Tenacity of Iron.—Iron or steel wire which has been acted on superficially by sulphuric acid is usually found to be altered in its properties. Its weight is increased, its tenacity is injured, so that, though originally soft and flexible, it easily breaks; and when a freshly-broken end is moistened by the tongue it effervesces as if acted on by a mineral acid. These effects after a time disappear. Prof. Osborne Reynolds, of Manchester, has ascertained that they are owing to the absorption of hydrogen generated during the chemical reaction which takes place when the wire is immersed in the acid. He found that, if an iron tube, closed at one end, be immersed in a dilute solution of sulphuric acid, hydrogen passes through the walls of the tube interior, and may be collected by attaching an India-rubber tube to the open end of the iron one, and passing it under a gas holder. Prof. Reynolds concludes that, whenever iron undergoes oxidation under water, it becomes saturated with hydrogen, and thus loses tenacity—an important consideration in the case of iron steam boilers or iron ships.

The Occlusion of Hydrogen in Iron.

A correspondent writes to the *Iron Age* as follows: The occlusion of hydrogen in iron may now be stated as a fact; and from recent investigations it has been determined that iron deposited galvanically contains very much hydrogen, with more or less carbonic acid, carbonic oxide, nitrogen and water, and that it may have occluded in it as much as 185 times its own bulk of these gases, principally hydrogen. These gases are evolved again on the application of heat.

This occlusion of hydrogen in iron is not an ordinary saturation; there appears to be no chemical action. It differs from the absorption of carbon, as the absorption of the latter does not in any case exceed 10 per cent. of the bulk of the iron, whilst the hydrogen is drawn with such force that 185 cubic inches of it may be packed and occluded in 1 cubic inch of the iron.

I conceive the cause of the absorption and occlusion of hydrogen in iron to be the molecular force of attraction, and that this force attracts the molecules of hydrogen, and compresses them within the physical pores of the iron.

The effect of the occlusion of hydrogen in iron is to make it hard and very brittle. The hardness is owing to the pores being filled with hydrogen of such extreme density, destroying the porosity of the iron. The brittleness is caused by the elastic force of the compressed hydrogen pushing against the sides of contiguous molecules of iron, thus reducing the resultant force of the physical structure, and causing the iron to be subject to a constant internal strain.

The occlusion of hydrogen in iron may seem to be of but little importance, but if the fact can be established that the occlusion is due to the force of attraction, it will explain many phenomena exhibited in the manipulation of iron and steel, which have not been satisfactorily accounted for.

Density of Hydrogen in Combination.—The avidity with which certain metals, as palladium, sodium and iron, absorb hydrogen is well known. The hydrogen thus absorbed forms a proper alloy with the metal absorbing it. Since, according to Graham, the elementary metals in alloys preserve the densities belonging to them when uncombined, it follows that, by comparing the ascertained density of any given metal with that of the same metal alloyed with hydrogen, it is possible to deduce the density of hydrogen itself in the solid state—a state to which it is impossible to reduce it by pressure or by reduction of temperature, or by both combined. This method has been applied by Messrs. L. Troost and P. Hautefeuille in the case of alloys of hydrogen with palladium and sodium; and the results are briefly stated in a recent number of *Les Mondes*. These experimenters found the density of palladium saturated with hydrogen to be 11·06, while that of the palladium itself, previously to the experiment was 12·0. From these data, combined with the increase of weight consequent upon the absorption of the gas, they deduced a density for hydrogen in the solid state of 0·62. A similar experiment made with sodium, gave for the hydrogen in combination, a computed density of 0·630. The two determinations very nearly agree, and the mean of them, viz: 0·625, may be taken as the probable density, which would give to hydrogen in the solid form a specific gravity somewhat above that of lithium, which is 0.50.

Effect of Heat on Germination.—It has hitherto been believed that a temperature of 150° Fahrenheit or upward is sufficient to destroy the germinative principle in wheat. Some experiments by Krasau, show that this is a mistake. In these experiments it was found that wheat thoroughly dried by very slow heat, with the help of calcium chloride, retained its capacity for germination unimpaired after being subjected to the temperature of boiling water for several hours. It need hardly be said, however, that this cannot be true of wheat which has not been dried. Boiling water promptly destroys the principle of life in all organisms which it can penetrate.

Luminous Apparitions or False Lights.—These are not due, as was long supposed, to the products of animal or vegetable decomposition, but are caused by insects which possess organs that become luminous at the time of their sexual congress. It is now well known that the phosphorescence of the sea is due to the presence of immense numbers of microscopic animals.—*Journal of the Chemical Society.*

Absorption of Gases by Iron.—John Parry lately read a paper before the British Iron and Steel Institute, in which he claimed that in addition to hydrogen iron and steel also absorbed zinc, cobalt, cadmium, bismuth, magnesium and arsenic. A very singular fact in connection with the absorption of arsenic was the circumstance that this vapor, when once absorbed, is not again cooled even upon heating the iron.

The Microscope.—The question as to the limit of capability of the microscope is investigated by Professor Abbe, of Jena; and he is led, by a series of physical deductions, to the remarkable result, that this limit is already as good as reached by our best microscopes, and that all hope of a deeper penetration into the material constitution of things than such microscopes now afford must be dismissed.

Cerro Gordo Mines.

EDITORS PRESS:—I have seen many noticee in the Ssn Francisco papers of the Panamint mining district iu this county, all very flattering, and I have no doubt very true. I have just visited Panamiut and believe the camp a good one, but do not see anything to pay for investment ontside of what is elready owned by the "Big Company"—Jones, Stewart, Relston and Parke. Thoy ere, as they eay, bound to have the whole thing, and already own the hest water snd wood rigbts and neerly all the mines that give any appearence of value. I do not therefore eee where outside capitelists have any chence of good investments in Panamint. Jones & Co. have a good thing, and they ought to have, as they have inveeted their money freely to open up a country which, but for their efforts, might have remained nnproductive for many years.

From Panamint I steered my way in a northerly direction about fifty miles to Cerro Gordo. Here I find a csmp that deserves credit for having supported itself and made money for ite miners and furnace owners from the heginning. There are two furnaces, esch about thirty tons ore capscity, now in constent operation—one owned by W. M. Belshaw and the other by V. Beeudry. The ore used by these furnaces ie snpplied almost entirely by the Union mine and the Ignacio silver mine. The base bnllion produced hy each furnace is ahout twelve and a half tons per day, and ie worth ahont $115 in eilver and $90 in lead per tou. The lead will pay expenses of mining, smelting and transportation to San Francisco, where its coet for refiniug is about $25 per ton, leaving a net profit of about $90 per tou. The Santa Maria and Omega minee, and the smelting works owned by the Owen's Lake Silver and Lead Company are now idle, but are expected to start up again soon. These mines are looking well snd ought to yield ae much as the Union.

To give eome idea of the profits made against the capital interested here since the smeltiug works were first started, I subjoin the following table, which I think is nearly correct:

Capital involved in furnaces, mines, bed-rock tunnels, etc., each year.	Total.	Bullion produced, tons	Net profits at $80 per ton.
1869.....$15,000	$ 15,000	1,000	$ 90,000
1870..... 15,000	30,000	1,500	135,000
1871..... 30,000	60,000	2,500	225,000
1872..... 15,000	75,000	4,000	360,000
1873..... 10,000	85,000	5,000	450,000
1874..... 16,000	100,000	6,000	540,000
Total			$1,800,000

The mines of this camp are not half opened, or even prospected to any extent. Between the Union mine snd the lower town of Cerro Gordo, a distance of about 3,000 feet, there are no less than ten parallel veins, or lodee, many of them, eo far as prospected, of equal promiee with the Union or Omegs.

To cut these lodes, as well ae all blind lodes on its couree, and to afford better facilities for working the mines now in operation, a company called the Potosi Miuing and Smelting Company was organized some time ago in San Francisco, and has commenced a tunnel, known as the Potosi tuunel. It commences in the lower town of Cerro Gordo, and has a couree of about 70° E., and will intersect these lodes nearly at right angles, and at depths varying from 500 to 2,000 feet, cutting the Union and Santa Maria about their southern line, at a depth of over 900 feet. Pending the arrival of their Burleigh drill mechinery, with which this company propose to prosecute their work, they are pushing the tunnel ahead by hand labor, and have already made a distance of about 450 feet, and crossed two silver-bearing quartz lodes, which they are now prospecting with good results. A fair supply of water hae also been etruck in this tunnel, the value of which cen only be aporecieted by those who heve to pay four cents a gallon for all they use, ae is the case in Cerro Gordo at present.

By careful eurveys of the surface, this company expect to strike mines at the following distances:

At 300 and 350 feet—Minee already crossed.

At 1,000 feet—Silver and gold miue, 500 feet below surface.

At 1,350 feet—Silver and gold mine, 500 feet below eurface.

At 1,600 feet—Silver and lead, 800 feet below surface.

At 1,750 feet—Silver and lead, 800 feet below surface.

At 1,900 feet—Silver and lead, 40 feet wide, 900 feet below surface.

At 2,100 feet—Silver and lead, 850 feet below surface.

At 2,500 feet—Silver and lead, Exteneion of Senta Maria, 900 feet below surface.

At 2,700 feet—Silver and lead, Union, 1,000 feet below eurface.

At 3,3000 feet—Silver and lead, Buena Viste, 2,140 feet below surface.

The cost of tbis tunnel will he about $100,000, and it is said will be completed in less tban one yeer from the time the machinery ie placed.

Here ie an iuvestment which it would seem ought to attract the attention of capitalists. This is no new camp, but has been thorongbly tested: the Union miue to a depth of 600 or 700 feet, and the Omega to a depth of about 500. These mines and others that have been worked have improved both in quantity and quslity of ore steadily ss they have gone down. All they now want is a means of getting their ore out below their present working.

To effect this object they have their choice of sinking a main shaft 1,000 feet, and erecting extensive and costly hoisting works, or paying the tunnel company fair royalty for the privilege of ruuning their ore out through the Potosi tunnel. If a shaft were commenced now, and work thereon prosecuted with vigor, it migbt possibly he got to the tunnel level by the time the tunnel reaches that point, and at the same expense which would have to be borue by the individual owners of one or two mines; but these mine owners are all in favor of the tunnel enterpri-e, and wisely conclude to wait for its completion, and in the meantime work with their present appliances. I shall visit Wancoba and other mining districts in this county shortly, and give your readers such information as I can communicate by letter.

A MINING MAN.

THE Clear Lake miuing district has been formed in Lake county. The boundarice are as follows: Commencing at the northeast portion of the Hawkins arm of Clear Lake, thence northerly to the msin creek in Long valley, thence up said creek to the top of the mountain, thence along the mountain to the head of the main fork of Clover creek, thence down Clover creek to Scott's creek, thence up Scott's creek to the mineral eprings, known as the Bynum or Adams springs, thence easterly to the place of beginning. Woods Crawford is Recorder.

THE Chinamen are quietly buying up all the old piecee of miniug ground to be found neer Oroville that they can get cheap. They are taking out a large amount of dust each week. There are now about 4,000 Chinamen at work in the Leva Beds below town, and all seem to be doing well.

MINING SHAREHOLDERS' DIRECTORY.

Compiled every Thursday from Advertieements in the Mining and Scientific Preee and other S. F. Journale.]

Mining Stocks.

The mining etock market has been in quite a buoyant condition for the past week, which etill continues. Stocks have not been very high, hut the market, nevertheless, shows considerable strength. Advices from the leading mines, especislly thoee on the Cometock, are favorable. In thet region they are now beginning to talk of 4,000-ft. shafts and if they carry out their ideas, which seems prohable, we will heve the deepest mines in the world. All this is good for the menufscturers in this city as well as the miners themselves. Assessments recently heve beeu very plentiful. Since our last week's table was made up the following assesements have been levied: Chollar, $5 per share, delinquent December 18; Mint, 8 cts.; Rock Island, $1 per share; Empire (Idaho), $1; Ida Elmore, $1; Justice, $3 per share; Lady Bryan, 50 cts. per share; Poorman, 50 cts.; Woodville, $1 per ehare; North Belmont, 50 cts.; Watson, $1 per share and Buckeye, $1 per share. The Idaho etocks at present make a bril iant showing in the sssessment list, while the names of none are on the dividend paying list. There are more of them under assesement just now than ever at any one time before.

THE Placerville *Democrat* says: Owing to a clesh between the San Francisco and London etockholdere, operations at the St. Lawrence mine have ceaeed, hoth in the mill and under ground. At the time of qnitting work the north drift was in the fineet ore ever seen in the mine. The euspeneion will result in the filling up of the mine with water and this will lead to a general caving in, which will be the utter ruin of a valuable and finely opened mine, the deepest in this conuty.

REPORTS from the engineers who are rnnning the preliminary lines for the Los Angeles and Independence railroad, are to the effect that they find the Cajon Pass the moet practicable, and that route will probably be eelected.

Sales at the S. F. Stock Exchange.

New Incorporations.

The following companies have filed certificates of incorporation in the County Clerk's Office, San Francisco:

NORTH CALISTOGA M. Co.—Nov. 16. Location: Lake Mining District, Napa county. Directors—Wm. Burling, W. M. Lent, C. Hensch, A. P. Cox and James P. Sargent. Capital stock $6,000,000, divided into 60,000 shares.

PROVIDENCE M. & M. Co.—Nov. 13. Location: San Ygnacio Minlug District, State of Sinaloa, Mexico. Directors—A. Poulaix, B. Bompard, J. R. Lafaix, Felix Pyat and A. Fossard. Capital stock $120,000, divided into 1,200 sbares.

MAMMOTH Q. Co.—Nov. 16. Location: Lake and Napa conntie. Directors—J. W. Lynch, J. O'Farrell, A. Rodgers, J. B. McCue and C. J. Eaton. Capital stock $10,000,000, divided into $100,000 shares.

The following companies bave filed certificates of incorporation in the office of the Secretary of State, at Sacramento.

SONOMA AND MARIN R. R. Co.—Principal place of business, Petaluma; capital stock $1,000,000, in shares of $100 each.

SANTA CRUZ AND FELTON R. R. Co.—Principal place of business, San Jose; capital stock, $1,000,000, in sbares of $100 each.

INCREASE OF CAPITAL STOCK.—The officers of the Mount Savage Mining Company bave filed with the County Clerk a certificate of the increase of capital stock of that company from $6,000,000 in 60,000 sbares to $10,000,000, divided into $100,000 sbares. It is averred that the whole amount of the original stock is paid in, because it is represented by the mine. The liabilities of the company are stated to be the ordinary floating current accounts and $3,000 borrowed money.

Meetings and Elections.

NORTH CALISTOGA M. Co.—Wm. Burling, President; Wm. M. Lent, Vice-President; A. P. Cox, Secretary and Treasurer, and Mr. Frank Tagliabuc, Superintendent. Office, 24 Merchants' Exchange.

GIANT POWDER Co.—Trustees: Egbert Judson, Albert Dibblee, H. Brickwedel, A. Block and Levi Stevens. Subsequently, A. Dibblee was chosen President and H. Pichoir was continued as Secretary. Regular monthly dividends of 1½ per cent. bave been paid during the year.

THE emelting worke in Sacramento have been shut down for a couple of weeks, and will not start up again till the company have seoured the servicee of a thoroughly competent superintendent.

THE opening of the three new coal minee, the renewed ectivity at the gold sand mines on the Coquille, and the increase in the production of lumber, will all contribute not a little toward the development of the steamboat husiness on Coos Bay.

THE Consolidated Virginia mining company are making rapid proprese in the construction of their new sixty-stemp mill. Once it ie started up it will give steady employment to a large number of workmen.

A MINING district hee been organized in Mendocino county, including the newly discovered eilver mines of Mount San Hedrim.

MINING SUMMARY.

THE following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

California.

ALPINE COUNTY.

NUMBER OF CLAIMS.—Alpine *Chronicle*, Nov. 14: The number of mining claims surveyed in this county for the purpose of procuring a United States patent is eight, as follows: In Monitor mining district, Manchester, Winchester and Merrimac; Silver mountain, Pennsylvania and Exchequer; Alpine, Silver Cloud. The Adolphus and Pine Tree mines are to be surveyed, and that will close the business for this season. The Lady Franklin, Mountain and Silver Cloud companies have made applications for patents.

ODEN.—We have advices that the Ogden Mining and Smelting company of Chicago, will early next spring ship from that city machinery for a quartz mill, to be erected in this town. This company owns the George Washington mine. It is presumed that negotiations for the purchase of the Pennsylvania mine by this company will be resumed.

CALAVERAS COUNTY.

GWIN MINE.—Calaveras *Chronicle*, Nov. 14: Unusual activity is observable at the Gwin mine. New and powerful hoisting works have recently been added to the machinery. Sinking for the purpose of running a new level—the 1,000-ft.—has been commenced. A few years ago the croakers about "barren Calaveras" would have laughed at the idea of a shaft in a quartz mine ever reaching the depth of a thousand feet in this county. Now, actual development has proved the Gwin to be one of the most valuable mines in the State, and it is only one of a good many to be found within the boundaries of Calaveras.

SANDERSON MINE.—The main shaft, the sinking of which is steadily progressing, is nearly 400 feet in depth. The ledge shows from two to two and a-half feet in thickness, composed of an excellent quality of ore.

PRUSSIAN HILL MINE.—The new shaft in the Prussian hill mine, near Railroad, has reached a depth of 225 feet and rock is now being actively stoped out. The quartz is said to be rich and the ledge wide.

COLUSA COUNTY.

QUICKSILVER.—*Colusa Sun*, Nov. 14: The Abbott Quicksilver mining company recently made their second clean up, and took out 27 tanks of quicksilver. Each tank contains 76½ pounds.

HUMBOLDT COUNTY.

NEW MINE.—Mendocino *Dispatch*, Nov. 14: Jehiel Smith, who has just returned from his mine in Humboldt county, Nevada, has shown us some specimens of the ores from his mine. He has run a tunnel some 60 feet or more, and has struck the ledge about 15 feet from the surface of the ground, perpendicular, where he finds the ledge full two feet thick. In quality, the ore ranges from $90 to $800 per ton, in value. It is a mixture of lead and silver; in weight, the lead largely preponderating, but in value nearly equal. Mr. Smith brought 100 pounds of his ore to the smelting works in Sacramento, from which he expects a return within a few days.

LAKE COUNTY.

DISCOVERIES.—Napa *Reporter*, Nov. 4: Rodney Hudson was in town on Wednesday, and from him we learn that investigation has developed very rich mines some six miles from the Calistoga Silver mine and one mile from Cayote valley. A mining district is to be formed here immediately, and the names of the fortunates who lay claim to this district are David, Elbert and Rodney Hudson, W. McCormick, W. S. Whitton, N. P. Banks, A. Brunson, H. D. Serepture, W. H. Williams, Lanla Whiting, Hattie and Jennie Elam, Ada Linwood and Dana Brown.

BAKER MINE.—Lake county *Bee*, Nov. 12: Mr. Bolter, foreman of the Baker quicksilver mine, situated four miles below Lower lake, informs us that it is one of the best mines he has ever worked in, and he has been employed in many, being an old miner. They have now 500 tons of good average ore taken out of the mine. They have no smelting works as yet.

NAPA COUNTY.

MILL STOPPAGE.—Napa *Reporter*, Nov. 14: The recent storm caused a stoppage for a few days of the Calistoga quartz mill, but on Tuesday work was resumed, the mill crushing out its ten or twelve thousand dollars of bullion per week.

CALISTOGA MINE.—The mine still continues to crush out silver, spite of the fact that the bottom of the road between the mill and the mine has fallen out, and the ore wagons come in slowly. The ore averages by assay $100 to the ton, and the mill turns out from $85 to $87 for every ton thrown under its stamps.

NEVADA COUNTY.

PROSPECTING.—*Transcript*, Nov. 13: Prospecting seems to be going on at a lively rate all around. When prospect rock pays on an average $25 a ton, as it has here this summer, it would seem a profitable business to those engaged in it.

LUCKY MINE.—Foothill *Tidings*, Nov. 13: The management of this mine, we are glad to learn, this week passed formally into the hands of Captain John White as superintendent, who, it is expected, will put on a force of men and start up work if possible to procure a supply of wood for fuel at this late day in the season. This mine is situated about two miles from town, on Howard hill, and consists of about 1,500 feet on the Cambridge ledge. The vein is reached by a tunnel 400 feet long and thence worked through an incline shaft.

FROM the word go, is the way the Pittsburg claim out near Deadman's Flat has paid. We are informed that all the prospecting by shaft and drift, the hoisting and pumping machinery and other expenses have been paid from the proceeds of rock taken out and worked, and that there seems to be plenty of pay rock ahead. This is comparatively a new mine and in a district not heretofore prosperous, but it is said there are many locations in that vicinity that appear as well as the Pittsburg, which will be likely to receive attention as the result of this success.

STRIKE.—Johnny Schmidt, who owns a ledge out on Woods' ravine, near Nevada, is again in luck. The *Transcript* says he has been working his mine for several years, and at times it was very rich, but after incurring considerable expense some time since, in erecting hoisting works, and the mine subsequently failing to pay as well as usual, he found himself in debt, and had to mortgage the mine. He has continued work, however, and a few days since he struck some very rich rock. His son took out in a half day over a thousand dollars, enough in fact to pay off all his indebtedness. He has now two tons of rock out, from the same place and says it is very rich.

WHEAL BETSY.—Carpenters, engineers and laborers are now engaged in transferring the machinery of the old Heuston Hill mine to the Wheal Betsy, now owned by the Orleans Mining Company, where it is to be erected and work resumed on this once favorite claim. Wheal Betsy is located on Osborn Hill, and consists of five hundred feet of the Osborn Hill vein, lying north of the discovery claims.

EUREKA.—A visit to this celebrated mine this week enables us to contradict, so far as able to do so, judging by appearances, the report that it will soon go the way of the North Star—shut down. Judging by the woodpiles on hand it will be some time before such a dire result will be reached; and by the same token, considering the locality of said stacks of fuel, the main shaft will not be abandoned yet awhile. Then, too, the work of opening some new ground owned by the company, over west of the old works, seems to be proceeding with all due diligence and in a thorough manner. Machinery for pumping and hoisting is being erected and the pumping department was put in motion the day we were out, Wednesday. It took the water nicely, lowering it at a rapid rate while we were there. The power used is a small stream of water on an overshot wheel and when the hoisting machinery is added it will probably be the most economical mining rig about here.

Old miners laugh at the idea that the chute of ore originally found in the Eureka and pitching into the Idaho ground is the only one in all that region of well defined quartz veins, and we hope another year will not pass before the explorations below in the Eureka vein proper and upon several parallel veins in the vicinity, will prove their belief well founded.

PLACER COUNTY.

THE MINES.—Placer *Argus*, Nov. 14: The Orleans is looking well. The main shaft is down 100 ft. in good ore, and the ledge is fully five ft. thick. Two shifts of men are engaged in sinking, and good rock is being taken out. Crushing is suspended until the Eclipse mill gets in its new battery, which will probably be next week.

GREENE MINE.—The work of fitting up and cleaning out the mine is progressing favorably. Stoping on the 220-ft. level has begun, and good rock is coming out. The ledge runs about 20 inches, and is of good quality. The machinery has been repaired and fitted up, and is now in excellent order. It is the intention to move the mill from its present position up to the hoisting works, and add four more stamps. One of the engines will furnish the requisite power, leaving the other to do the hoisting.

ST. PATRICK.—The Crater Hill mine of the St. Patrick company is being opened out and cleared of the accumulated rubbish, ready for a vigorous campaign. The shaft is in good ore and the ledge is improving. The mill is running steadily on Crater ore, with good show for a rich clean up, the rock taken out being richer than was looked for.

YANKEE JIM'S.—Cor. Placer *Argus*, Nov. 14: There are two new mines that are being fitted up to work this winter. The Independent at Yonng America will be opened, and our old and esteemed friends, Dr. Smith, of Forest Hill, and James Hodges, of Yankee Jim's, are fitting up one at Forest Hill; I hope they will realize all they wish for. If anyone thinks our mines are worked out, they will be disabused of that idea by coming here and seeing the great improvements that are made every year. The Georgia Hill company have shipped from San Francisco, 700 kegs of powder, and will let off a monster blast about the 20th inst.

SAN BENITO COUNTY.

MINING SALE.—Gilroy *Advocate*, Nov. 14: Last week a sale was effected of the Stayton quicksilver mine, in the McLeod mining district, situated in San Benito and Merced counties. The stipulated price is $200,000, of which $10,000 was paid down, we believe, and the balance to come in regular installments. An English company of capitalists were the purchasers, and they propose to at once erect extensive works and commence the working of the mine in earnest. It is believed by experts that this will become one of the best paying mines in the State. With the present furnace, which has a capacity of reducing only about 900 pounds of rock per day, 76¼ pounds of quicksilver are extracted, worth at the present market price about $111. The expenses are light, and the daily profit can be easily estimated. The vein of the principal mine is 19 feet high by 12 feet thick, and there is said to be sufficient rock on the dumps and in sight to pay for the mine. There is another vein which will yield fifty per cent. of quicksilver, and various other undeveloped veins, which are believed to be rich.

SAN DIEGO COUNTY.

JULIAN MINES.—Cor. San Diego *World*, Nov. 14: The mining outlook is indeed very flattering for this time of the year. We have in Julian the Owens, Tom Scott, Helvetia and several other mines, all having flattering prospects. In the Cañoa and Banner, the Ready Relief, Hubbard and several other mines of lesser note are looking well and general activity seems to prevail throughout the two districts. Conat & Co. have an immense stock of merchandise on hand and are doing a thriving business, and in fact business of all kinds is much better than ever before in this section.

SIERRA COUNTY.

ROCK CREEK.—*Mountain Messenger*, Nov. 14: S. B. Ireland, the other day, took $7.50 worth of coarse gold from two car-loads of dirt, amongst which was a fine looking nugget, from the Ruby, formerly the Golden Gate mine. This claim adjoins the celebrated Bald Mountain, and promises well. In the spring an incline will be sunk, costing about $10,000, to reach the main channel. The pay dirt came from a bench in the diggings.

TUOLUMNE COUNTY.

GOOD GRAVEL MINE—*Independent*, Nov. 14: Per Johnson, who owns the extensive gravel claim at Douglasville, between the Half-way house and Columbia, has one of the best mines in the country. His last run of 17 days yielded $800, which, deducting $300 for expenses, netted him the sum of $500. It has paid at this rate right along for several years. For three years past he has worked it with hydraulic and hoisting works. He can wash off about 20 feet without hoisting, and with sufficient fall and a "little giant" he could roll out gold by pounds. He is now 50 feet below the surface, and how much deeper the gravel runs no man knows. The claim will last for many years yet, and, in his opinion, the best ground is to be worked yet.

Nevada.

WASHOE DISTRICT.

CONSOLIDATED VIRGINIA.—Gold Hill *News*, Nov. 12: The ore breasts on the 1,300, 1,400 and 1,500-ft. levels are yielding rich ore, and if anything, looking better than ever before. The face of both the north drifts on the 1,300 and 1,400-ft. levels, running ahead of the north ore breasts, are still in fine ore. Another winze has been commenced, designed to extend from the 1,300 north drift downward to the 1,400-ft. level. The bottom of this winze is also in fine ore. The stack-pipes for the new mill are being raised, the monster engine for running the machinery is being placed in position as fast as possible, and the whole will soon be ready to start into full operation.

OPHIR.—Sinking the winze in south crosscut No. 2, on the 1,300-ft. level, is making fine progress, the bottom still in rich ore. The ore breasts, on the 1,465-ft. level are opening out splendidly with still greater promise of better developments ahead. The bottom of the south winze on the 1,465-ft. level near the south line, is still in rich ore, also the face of the east cross-cut near the same point. The new air compressor is working finely, and the air pipes have been extended down to the 1,700-ft. level. The yield for last month reached $90,000, which amount will probably be greatly increased by the run of the present month.

WOODVILLE.—The ore body going south on the 300-ft. level is steadily improving in quality, the ore carrying a much larger percentage of gold; in fact the entire mine is showing much better in that direction. A clean-up day before yesterday of 120 tons of ore, the result of six days' crushing, gave a return of $3,935.12, being at the rate of about $35 per ton.

BULLION.—Driving the main north drift on the 1,700-ft. level from the Imperial shaft is making steady progress, still following the west wall of the ledge, with steadily increasing prospects of ore developments whenever cross-cutting the ledge shall have been commenced.

IMPERIAL-EMPIRE.—The bottom of both the north and south winzes on the 1,850-ft. level are still in rich ore.

DAYTON.—The ore breasts on both the second and third station levels are yielding finely, and continue to look well.

GOULD & CURRY.—Cross-cutting on the 1,500-ft. level is going forward as usual with no change.

KOSSUTH.—Sinking the shaft is making good headway, the rock in the bottom blasting finely. Sinking a winze south of the shaft in the ore vein, on the 200-ft. level, has been commenced.

NEW YORK.—The ore body in the south drift, on the 550-ft. level, has increased to 7 ft. in width, and is of a very promising character. The streak of ore in the north drift on the same level is about 4 ft. in width, and of good character.

CHOLLAR-POTOSI.—Daily yield, 70 tons of ore, the average assay value of which is $24 per ton. The ore breasts in the old upper workings are yielding the usual amount of ore.

SUTRO.—The main west tunnel is still driven vigorously ahead, the face still in ledge matter. The ledge matter has already been penetrated for a distance of 200 ft. without reaching any west wall.

CALIFORNIA.—Both the south drift from the Ophir and the north drift from the Con. Virginia, on the 1,500-ft. level, are making good progress.

ORIGINAL GOLD HILL.—The drift west at the 350-ft. level is still going ahead with excellent indications in the face.

LADY BRYAN.—The erection of the new pumping machinery is fast approaching completion.

SAVAGE.—Sinking the main incline below the 2,100-ft. station is making good headway, the bottom in good working ground. Sinking the south winze below the 2,000-ft. level is also progressing finely.

BELCHER.—Daily yield 500 tons of ore. The ore breasts are yielding the usual amount of fine ore, and the mine is looking finely throughout. After a careful examination of the new air shaft, the scene of the late conflagration, it was decided that owing to the heavy caves in the shaft that it would be safer and better to fill the old shaft up and sink a new air shaft than to attempt to repair the old one.

HALE AND NORCROSS.—The north cross-cut on the 2,000-ft. level has reached the west wall of the ledge without encountering any paying bodies of ore.

CROWN POINT.—Daily yield, 550 tons of ore. The ore breasts are looking finely throughout the entire mine. The face of the main south drift on the 1,500-ft. level is still in rich ore. Sinking the main incline is making good progress. The main east drift on the 1,600-ft. level, to cut and prospect the ore body on that level, is making steady progress. The mills are all running up to their full working capacity, with no prospect whatever of any considerable diminution in the yield.

KNICKERBOCKER.—The west drift on the 600-ft. level is fast approaching the ledge, the face still being in hard blasting ground. The west drift on the 700-ft. level is also making good progress toward the ore vein, cutting occasional clay seams, which are a sure indication of a near approach to the ledge.

JULIA.—The several pump stations are nearly completed; the pump columns are in place and everything will be in readiness to start the new engine and pumping machinery into full operation in a day or two more.

INDUS.—Still sinking the incline below the old tunnel level, the full size of the shaft still in fine milling ore.

CALEDONIA.—The 1,076-ft. station is about opened, ready to cut and prospect the ore vein on that level.

SENATOR.—The ore prospects in the west drift on the 400-ft. level still continue very promising.

UNION CONSOLIDATED.—There is a steady improvement in the face of the east cross-cut from the north drift on the 1,500-ft. level of the Ophir shaft.

SIERRA NEVADA.—The prospects in the east cross-cut in the old Sacramento ground are growing more favorable every day. The ore body in the north drift from the old Sierra Nevada tunnel is opening out finely and promises a good yield of fine ore. Daily yield, 60 tons of ore, keeping the mill steadily running.

SOUTH COMSTOCK.—Work having been resumed under the superintendence of John Nelson, a new double working shaft is being sunk in a very eligible location some 200 yards east of the old tunnel and incline.

LEO.—Rock in the face of the main tunnel getting softer. The ledge is better defined and the veins of quartz are widening again, the good ore struck next to the hang wall being now a foot in width.

DANEY.—There is every indication that the ledge has taken a much more perpendicular course than on the level above, and that the main west drift on the 400-ft. level will not have much further to run to cut the main ore vein.

Arizona.

MINING ITEMS.—Arizona *Miner*, Nov. 6: Two companies of miners, from the Gen Crook mine, arrived in town Monday afternoon last, with $2,700 in good gold, the proceeds of 21½ tons of Crook ore.

MESSRS. Hogle and Schultz arrived here yesterday from Big Bug district, where they have gold and silver mines of great richness. Their main stay is the "Silver Belt," upon which they have sunk a shaft forty-two feet in depth, at the bottom of which they have a very pretty ledge of rich silver rock, between case walls. Out of this shaft they have taken fully seven tons of ore which George expects will pay over $1,000 to the ton.

Montana.

NEW SMELTING WORKS.—Helena *Independent*, Nov. 6: Geo. Prediger, well known in this city, writing to Mike Reinig, from Los Angeles, California, under late date, says that a gentleman of his acquaintance has already purchased in San Francisco the machinery for a smelting furnace on a large scale; also that another party will complete his purchases next spring of another smelting furnace, both of them to be erected at Jefferson. These gentlemen are said to be fully posted in the reduction of silver ores, and having made a thorough examination of the area of Jefferson district, are prepared to engage in their enterprise with a full knowledge of all the details of the business as well as with the necessary means to insure complete success. To such parties Montana offers a boundless field and a certain reward.

The American Beverage.

There is evidently a strong tendenoy, both iu California and throughout the Eastern States, to return to our old-time Americ in beverage, cider. Excessively rigid temperauce notions undouhtedly had some influence in causing a decrease iu cider-drinking; bnt the nationsl preference of the increasing foreign element in our population has had more, and the power that fashion exeroises over appetite has also been felt here. Our fickle people have in many cases discarded the pure juice of the nple as a household drink, and substituted domestic wiues made from the red and hlack cnrrsuts, gooseherries, the wine plant, the elderberry, and other bases for wine, to which various ingredients were added, forming compounds more difficult and expensive than oider in making, and the drinkiug of which was quite as deleterious to health, and as reprehensible from the tempersnce stsnd point; and which also required a good deal of "make believe" on the part of the imbihers thereof, to make them as palatable as cider. Aud what, we would ask, has beeu the ssnitary or moral gain to the couutry iu substituting the lager-heer keg for the cider barrel in the cellars of our householders?

American cider, even as produced forty years ago, with the imperfect machinery then available and under other difficulties then existing, was a cheap, good and wholesome drink; one that was well suited to onr climate and to the habits of our people—especially farmers. It was one of the good things that autumn hrought to them; it was a regulative ingredient in the winter's fare, and in the seasons of planting, haying and harvesting it was a healthful, nonrishing drink, its acidity and "hardness" being quite nnobjectionable to those who had been drinking of it during its hardening stages. The quality of Eastern cider has been greatly improved of late, in consequence of improved machinery, better fruit nnd greater care in making and storiug. All who are acquainted with the old style of cider-making, know that nothing but the refuse of apples were used, and even these were left upon the ground to partially rot, and were then carelessly gathered and hauled to the cider mill, where they perhaps remained for a fortnight before grinding, owing to the great rush of business at this season, and the limited faoilities for manufactnring. Now, however, cider-making is as greatly improved as any other part of farm work.

Battle Creek, an enterprising little city situated in the center of the apple oistrict of Micbigan, hae just erected a very extensive establiehment for the manufacture of cider on an elaborate scale. The buildings are just outside of the city, and are located with special referenoe to easily receiving snpplies and making shipments, side tracks from two railroads having been built for their accommodation. The most interesting portion of tbe establishment is the cider mannfactory, a large bnilding filled with a bewildering confusion of tanka, tubs, oomplicated machinery, presses, boilers, engines, etc. The presses, of which there are three of the largest size, are capable of making 400 barrels of cider a day. The apples find their way into the mill hopper through a long bin or trough large enough to hold 10,000 bushels, which passes through the side of the building to the streets, where the fruit cau be thrown into it from the farmers' wagons. The cider, as it trickles from the presses, falls into a large vat beneath the floor; thence it is carried throngh pipes, by means of a force pump, to several tanks in the second story, where it is again filtered. From these rubber hose is led outside the building to the freight cars to be loaded. The empty barrels being placed in the oars, they are filled one at a time hy simply turning a stop-cock, which allows the cider to pass from the tanks through the hose and into them. Including the boiled, fonr kinds of cider are made—the first is the simon-pure juice, the second is a clarified article, and the third is n compound of cider and hops. This last has bscome a very popular driuk for bilious persons. A fruit-preserving house, four stories high, and of peculiar construction, is another novelty of the establishment. This has a capacity of 30,000 barrels, and fruit placed in it oan be kept perfectly sound for three years. The walls are of solid stone, 30 inches thick, and the floors and walls are covered and backed up with 10 inches of sawdust, covered with galvanized iron.

Cider as an article of commerce is also greatly enhanced in value. Twenty-five years ago the standard price was one dollar ner barrel; now it sells readily for five dollars. Cider ought to keep hetter in California than in the Eastern States. Our dry climate, with its equable temperature, should preserve freshness aud flavor throughout the summer. We do not believe iu any compounds for improving cider. Give us the pure juice of the apple.

We find in a recent number of the *New England Homestead* the following sensible suggestions in regard to disposing of cider: When the cider is made strain out all the pomace you can, then leach through a barrel of cleau sand. If the sand is not entirely olean, put iu water until it runs clear, then put iu cider, which will drive out the water remaining in the sand. Put in clesn barrels; if yon use liquor casks, look out for the poisonous drngs in the bottom, few are free from them. A good, well-sosked and clean cider vinegar cask is as good as any (discard those that have contained acid vinegar); fill the casks full, so that they will work out at the bunghole, and keep them so until the fermeutation has ceased. Then bung tight and keep till Msrch; then bottle, corking tight, with good, firm corks, snd tie the corks in. If yon add a raisin to each bottle it will add to the flavor. Cider trested in this way will keep for yesrs, if you don't drink it. If bottling is delsyed until the warm weather comes, and the second fermentation commences, it will be imposeible to make the bottles hold, or prevent the cider from turning to vinegar. The secret of having cider keep well before bottling, is in freeing it from all dregs or emptyings, and after bottling and corking tight, to exclude air, to be kept of course in a cool cellsr.

Curiosities of Ventilation—The Belcher Air Shaft.

The big air shaft of the Belcher compsny, the timbers of which were lately destroyed by fire, is considered to he lost beyond redemption. It has caved so extensively that it will be impossible to clear it ont snd retimber it. Although it was said to be sunk in west country rock, yet at the top the shaft psssed through vein matter, a distance of severs hundred feet, before reaching the west country. Half the length of the shaft between the enrface and the 1,000-ft. level is very bsdly caved; it is also badly caved at the hottom, nesr the 1,000-ft. level. It will now be necessry to excavate a new shaft, snd this will probsbly he sunk some distsnce further west than was the one just destroyed. It would be a good plan to sink the new shaft near the Crown Point line, in order that both that and the Belcher might be benefitted by it. Previous to the fire the draft in the shaft was downward into the mine. It was what was called a "downcast." At the time the shaft was buruing it was predicted by the experts that after the fire was out the draft would be found to have changed, and it would theu be upward. Although the shaft is pretty much blocked up by the caves which have occnrred in it, the draft, what little there ia, is upward. The Yellow Jacket shaft, previous to the great fire in that mine some years ago, had a strong draft downward; the fire changed the draft, and it has ever since remained an upcast.

This is a curioue freak of nature which all old miners have observed. Once the change in the draft tskes place it is permanent. A curious thing in ventilation—and it is a nut for the scientists to orack—is that everywhere along the Comstock lode the tendency of all the currents of air is to the southward—in the same direction that the ore chimneys tend. Here is certainly at work auother mysterious force in nature. This tendency of the air currents to move southward has never heen overoome, except in one or two instances, and these exceptional cases we shall presently give. First we ehall mention some queer freak in ventilation not epoken of by Mr. Sutro in his lecture on his tunnel, although in that he has much to say in regard to ventilation. Should we tell him that there is a probability of his tunnel drawing the wrong way, in case of his completing it, he would scout the idea, yet snch a result ie not at all improbable. The theory is that when two ehafts are connected by a drift, the draft or ascending cnrrent will be through the higher shaft—the longer leg of the siphon—is exactly reversed if the short shaft stand is to the southward of ths long one. The air will even go down a shaft and crawl out throngh a tunnel when that tunnel runs in a southerly direction. When the Union tunnel connected with the old Ophir mine, the air did not draw through the tunnel and pass up and out through the main shaft, but came out of the month of the tnnnel. When the old Best & Belcher works connected with the old Gould & Curry tunnel the same thing was seen; the air went down the shaft and passed out at the mouth of the tunnel. About the next connection of the kind made on the lead was hetween the Crown Point and Belcher, at the depth of 160 feet; and here the current of air went down the higher shaft, moved southward and came out at the Belcher. Next the Yellow Jacket and the Crown Point connected, and the air went downward and southward to the Imperial. The Yellow Jacket and the Imperial then connected, and the draft was south to the Jacket. When the Gould & Curry and the Savage connected, the draft went eouth to the Savage. When connection was made between the Ophir and the Consolidated Virginia the air went south to the Consolidated. The only places we know of on the lead where the air moves to the northward is between the Gould & Curry and the Consolidated Virginia, and hetween the Hale & Norcross and the Savage, nnd there it probahly would not move north bnt for extra strong inducements.—*Virginia Enterprise.*

THE dye-stuff called rossnilin, which gives a beautiful carmine color, ie an arseniferous production allied to arseniate of lime. It is used in lithography, aud for painting wooden vessels, etc.

ALL of the survivors of the fire in the Belcher air shaft are now convalescent, and some of them are again able to resume their usual duties aud vocations.

Going for the Bottomless Pit.

Many of the leading mining companies on the Comstock lode are now down to the depth of 2,000 feet, and a few still deeper. When mining first began on the grest lode snch a depth was not thought of. or, if thought of, no one expected to see mining operations carried to such a depth of 2,000 feet in less than fifty years. Now we not only do not feel startled at hearing the great depth of 4,000 feet apoken of, but when we see preparstion in actual progress for sinking that far we think but little of it. The Savage company, whose works we yesterday visited, hsve broken ground for the foundations of new machinery, which is to be sufficiently powerful to sink their main incline to a depth of 4,000 feet. This incline is already some distance below the 2,100-foot level, and is still being vigorously pushed downward. But the present machinery caunot be expected to do the work required more than a few months longer. Already it has done much more than wss anticipated when it was erected. We refer to the engine and machinery used in hoisting from the hottom of the incline. New machinery must be procured, and for the erection of thia preparations are now being made. A force of men is now at work at einking the huge pits in which are to be laid the foundations of the powerful incline engines. Indeed, these pits are fast approaching completion, and soon the stone masons will be st work on the foundations. The new hoisting machine will be supplied with two 24-inch horizontal cylinders, of 4-foot stroke nnd will be of over 400-horse power. The foundations to this engine are heing laid about 80 feet to the westward of the present hoisting works. A building 50x60 feet in size, will be erected over the new hoisting engine snd the machinery connected therewith. The carpenters are already at work framing the timbers for this bnilding. The steel wire rope to be used is to be 4,000 feet in length, and will weigh about 24,000 pounds. It is now heing manufactured by John A. Reebling's Sons, Trenton, New Jersey. It will be a round rope and the npper end will be two inches in diameter, but 2,500 feet of its length will be tapered, and the lower end will be 1¾ inches in diameter. The reel on which this cable will wind and unwind will be conical, and tho cable will wind about it spirally. When the greater part of the cable is down in the incline aud its whole weight is added to the weight of the incline oar, the rope winding on the smaller end of the reel, when the machinery will have its greatest purchase, and as the cable is finally wound np it will run upon the larger end of the reel. Thus the same steam will do the work at any point in the journey of the car up and down the incline track. The cable, after leaving the reel at the hoisting engine will pass over a pulley at the top of the gallows frame above the shaft; at the hottom of the perpendicnlar portion of the sheft it will pass under a lsrge pulley stationed at that point, and will theu be carried down the incline, running in friction pulleys placed at proper intervals in the center of the oar track. The engine for the new works is being manufactured hy Booth & Co., of the Union Iron Works, San Francisco, and will he completed about the 1st of Febuary next. The new hoisting machinery will be in readiness for starting up abont the 1st of Aoril following. The Ophir company contemplate the erection of similar machinery, and propose pnehing their works to a like depth. The Crown Point company already have in operation machinery of much the same character as that being erected by the Savage folks, and having a cable of sufficient length to sink to the depth of 3,500 feet. The Hale & Norooss company, Consolidated Virginia company, and other leading companies at this end of the lode will erect similar powerful works, and will at once plnnge down into the great nnknown "depths profound," in which lie hidden the silver roots of ths Comstock.—*Virginia Enterprise.*

COPPER AT SPENCEVILLE.—We learn from Frank Power thnt work is being prosecuted on the copper mine at Spenceville, under the superintendency of Mr. Deetkin, with every prospect of success. The shaft is down 50 feet, and the ledge at that depth is seventy feet in width. The rock is richly impregnated with native copper, and is being proven a very rich mine. The ore is taken out and roasted in a large furnace, after which it is turned into three large vats, npon which a stream of cold water is turned, and the copper, in a state of solution, ie then conducted from the vats into a large oylinder of about twelve feet in diameter. In this ie placed old or refuse iron, for which the copper has an affinity. The cylinder is made to revolve rapidly by steam, by which means the copper is collected on the iron. Specimens were shown ns which were taken off the pieces of iron, which are equnl to the best Michigan or Norway copper. The snperintendent thinks the process of separating copper from the ore in which it is contained is no longer a matter of experiment. There are many other ledges in the vicinity equally as rich and are awaiting the success of working this one. They will eventnally be worked, and that seotion of onr county is destined to become very lively in the fnture. It will repny anyone to visit the mine and see the operations carried on there. The superintendent is ready to afford all the information in his power, and is very confident of the richness of that section. —*Nevada Transcript.*

Eastern Nevada Mines.

From C. T. Goodrich, sn old-time Enrekan, who now resides in Steptoe valley, we are favored with the following items relating to the mining districts in that vicinity:

At Cherry Creek

The mines are looking fine. The Geneva Cross under the superintendence of Mr. Stsnford, is producing a splendid qusntity of high-grade ore. The lodes in the Tea Cup mine are incressing in size and richness as depth is attained. The Star mine, under the mansgement of E. D. Dickinson, formerly of the Lemon company of this place, is taking rsnk as one of the lesding properties of the district, furnishing 15 tons of fine ore per day to the stamp mill at Eagsn. Mr. Phillipot has bonded the Pacific mine, and will put a force of men to work as soon as possihle. The Flsgstaff is working s smsll number of meu. The ore is worked at Thompson's mill.

Nevada District.

The mines bonded by the Wsson company are looking well, and work is being vigorously prosecuted in developing the different claims.

Ward District

Is regarded as the coming camp of the Grest East. Present developments indicate thst it will be second to Washoe in regard to the richness and excellent quality of the ore. The Paymaster ledge is attracting considerable stention. It is claimed to contain the lsrgeet and richest quantities of milling ore in the esstern part of the State. At a depth of fifty feet a cross-cut shows the ledge to be fifteen feet wide, carrying six feet of high-grade ore averaging $600 to $1,000 a ton, the remaining nine feet showing second-clsss ore valued at $80 a ton. A contract has been msde with the Watson company, of Rohinsou district, to crush 1,000 tons of ore from this mine. Several hundred tons are being delivered at the eastern furnace to mix with the base ores from the mines of the above dietrict.

Robinson District.

The Canton furnace is expected to fire up on the 9th inet. Jndge Walsh is Superintendent of the above company's furnace. The Elijah is taking out ore averaging $65 to the tou. The Snuburst, owned by Lynch & Co., has sold sixty tons of ore to the Canton furnace, and has twenty tons on the dump, which is worth $80 a ton. The Altman mine is rich in gold and silver, but the ore is too heavy iu lead for milling. In washing the dirt ont of a pile of ore a few days siuce Billy Montgomery fonnd a gold nugget weighing 2¾ ounces. The Lynch mine is a very likely property, and is being developed.—*Eureka Sentinel.*

CHLORAL HYDRATE FOR HORSES.—The ooachmen in Bordeaux, France, have for some time time past been in the habit of giving horses in their charge chlorals so as to make them easier to ride or drive. The drug acted like a charm, for horses which had been previously so spirited as to give much trouble to their drivers became as quiet as lambs after a few days of this treatment. The great change naturally attracted the attention of the owners of the animals, and they sent for the veterinary surgeon to ascertain the cause of thie sudden gentleress. That functionary notioed a certain tendenoy to aleep in the animals, but scarcely knew to what to refer this unnsual condition, when in one of his visits he chanced to find a bottle half full of chloral. When he questioned the delinquent coachman as to the use he made of the drug, the latter, after much hesitation, owned that, following the advice of a brother whip, he gave his horses a dose of chloral every morning to make them go quietly, and further, that many of the fraternity in Bordeaux followed the same plan.

MCGANNEY ET AL. VS. BLUE POINT MINING COMPANY.—The motion to dissolve the injunction heretofore i-sued in this action, came before Jndge Keyser of the District Conrt, at chambers on Tuesday, when the defendants asked leave to withdraw their motion without prejudice, and leave was granted. The action leaves the work suspended at the mine in possession of Lyman Ackley, as receiver, he having given $80,000 bonds. This mine was cleaned up a few days sgo after a run of 29 days, and we understand that the amalgam gold from the run amounted to a little over $75,000. There are eeven interests or ownere of the mine. Four-sevenths of the company having leased the tunnel of the Blne Point and the Nevada Ditch Mining company (which must be worked throngh the tnnnel) to themselves for a nominal sum, the three-seventha have brought snit for a dissolution of the incorporation and the sale of the property.—*Marysville Appeal.*

UNION GRAVEL.—We learn, says the Ssn Juan *Times*, that the Union Gravel Company, whose mine is located at Kennebeok Hill, of which our friend W. W. Nichols is the Superintendent, is making great improvements in its mine and works with the nnticipation of being ready to commence washing by the middle of this month, if a supply of water can be had. This company struck rich gravel just before thsy closed down work this fall for want of water. Persons who have seen this streak of gravel represent it to us ss being wonderfull The vein is ahont eight feet in depth, from the bottom np, and free gold oan be seen lying aronnd loose. The gold is found in hlne cement. We congratulate onr friend Nichols on his good fortune. He deserves it all, for no man has fought more manfully for it then he.

Good Health.

Transfusion of Blood.

An Interesting Surgical Experiment.

An interesting experiment was performed on Friday last in Fall River, Mass., by Drs. Julins Hoffman and Louis Weyland of this city. Herman Dnboia had suffered from consnmption for five years, and had become very weak and debilitated. Physcians advised him to seek a warmer climate, bnt he had not snfficient streng h to avail himself of this chance of relief. Dr. Hoffman had transfnsed blood from animals, dogs and lambs, to the human subject with snccess in six caees, and it wae determined to make the exporiment npon Mr. Dnbois. Dr. Hoffman described the operatiou as follows:

A healthy, active lamb was procured and taken to the room where the patient reclined. The animal was laid upon its side. An incision was made on one side of the larynx, expoeing the carotid artery. When thie artery was fully exposed a ligature wae tied aronnd the vessel, ehntting off completely the blood current. At a distance of abont an inch and a half below the ligature a powerfnl pair of forceps wae applied to the artery, compressing the veeeel perfectly. Thns there wae a epace between the ligature and the forcepe which could be opened without danger of hemorrhage. A small incision waa made into the artery in this inclosed space. Then a glaes tnbe slightly bent was inserted into the artery. A small iethmus of constriction had been made in the part of the glase tnbe inserted into the artery, which enabled the tnbe to be securely tied into the veseel. After the tnbe had been seonred in the lamb's artery, everything was made ready for work npon the patient. In Mr. Dnboie' arm the vein at the bend of his elbow connecting the basilio and cephalio veins was exposed. A bandage wae tied around below the proposed incision to prevent a flow of venous blood from the wound. After exposing the vein by an incision an inch long, forceps were placed above and below, shntting off the blood current from a space abont half an inch long. The lamb'a neck was then bronght close to the patient's arm, and the pressnre of the forceps npon the lamb'e artery relaxed. The blood rushed through the tnbe, expelling all the air. Then the opposite end was skillfolly inserted into the patient'a vein and the pressure of the forceps npon the lamb'e artery was removed. The bright blood leaped through the tnbe and entered the system of the patient. The stream wae kept np for one minote and 40 seconds. Then the compreesion was removed and the tnbe removed. Yesterday I heard from Mr. Duboie, and he haa sufficiently recovered his etrength to enable him to visit a warmer olimate this coming cold weather, with good prospecta of regaining his health. The lamb is also alive and doing well. A lamh nsed in the same manner in a former experiment in thie city is still alive, and is now tied in a stable in an adjoining street. The hnman snbject was eo much benefitted that he epent the summer in the Catskills, and ie now in Baltimore.—*N. Y. Tribune.*

The Pulse.—Every intellectnal person ehould know how to aecertain the etate of the pulse in health; then by comparing it with what it was when he is ailing, he may have some idea of the nrgency of hie case. Parents should know the healtby pulse of each child, ae now and then a person is born with a peculiarly slow or faet pulse, and the very case in hand may be that peculiarity. An infant's pnlse is one hundred and forty; a ohild of eeven, abont eighty; and from twenty to sixty years it ie seventy beats a minnte, declining to eixty at four-eoore. A healthfnl grown person's pnlse heats seventy timea in a minute; there may be good health down to eixty; bnt if the pulse always exoeede seventy, tuere is a disease; the machine ie working too faet; it is working itself ont; there ie a fever or inflammation somewhere, and the body is feeding on itself, as in oonsnmption, when the pnlse is quick—that is, over seventy—gradually increasing with decreaeed chances of cure, nntil it reachee one hnndred and ten or one hundred and twenty, when death comes before many days. When the pnlse is over seventy for months, and there is a slight congh, the lungs are affected.

Breathing Through the Nose.—The pernicions habit of breathing through the month while sleeping or waking, ie very hurtfnl. There are many persons who sleep with the mouth open, and do not know it. They may go to eleep with it closed, and awake with it closed, bnt if the mouth is dry and parched on waking, it ie a sign that the mouth has been open dnring sleep. Snoring is a certain sign. Thia habit shonld he overcome. At all timee, except when eating, drinking or epeaking, keep the mouth firmly closed and breathe through the nostrile, and retire with a firm determination to conqner. The nostrils are the proper breathing apparatus—not the month. A man may inhale poieonone gasos through the mouth without being aware of it, bnt not through the nose.—*Science of Health.*

Amputating the Tongue.—A singnlar surgical operation was performed at Loe Angelee, a few days ago, on Adolfo Leibas, a hoy twelve yeare old. He bad hypertrophy of the tongue, which organ protruded four inches from his month. It was ont off so ae to leave a natural sized tongue. The operation was a snccess, and now the patient can speak.

Infanticide by Opium.

One of the best informed physicians in England, Dr. Mitchell, employed in the public health service, some time ago published a mass of testimony obtained by him from unmerous medical witnesses, showing the almost nniversal resort to opinm in order to beuumb and stupify children, even those of the tenderest age, a very common preparation for this purpose being a so-called cordial made of treacle and opinm. So general, it appears, is the nse of this mixture, that customers go to the apothecaries, and, without any hesitation, ask for a dose of it "to give to the baby next day, as they are going out to work." Chemists frankly admit that they make and sell these opinm decoctions by the barrel and hogshead full.

This baneful nsage prevails not only in the colliery districts, but also in maunfactnring and non-manufacturing pl ces; and it is stated by one physician that in the Nottingham, Derby and Leiceeter di-tricts the habit of administering opium to infants nsually begins when the child is three or four months old. And still another witness asserte that the opium cordial ie given on the very day of birth, being in readiness for that event. The inevitablo resnlt of thie terrible custom is, of course, that a great unmber of infnnts perish, either suddenly from an overdose, or, as more commonly happene, by slow, paiuful, insidioue disease. Compared, therefore, with this form of infanticide, the kind practiced by the Chinese may be said to be meroiful.

Useful Information.

How Bar-room Liquors are Made.

There may be seen daily, on Cheetnut street, saye the Pbiladelphia *Bulletin*, a man dressed in faultless apparel, with a great diamond npon his breast, vainly endeavoring to ontglitter the magnificent solitaire on hie finger. In a German Univereity he learned chemietry, and not even Liebig knowe it better. His occnpation ie the mixing and the adulteration of liqnors. Give him a dozen casks of deodorized alcohol, and the next day, each of them will repreeent the name of a genuine wine or a popnlar spirit. He entere a wholesale drng store bearing a large basket npon hie arm. Five ponnds Iceland moss are first weighed ont to him. To raw liqnor this imparte a degree of smoothnees and oleaginousnese that givee to imitation brsndy the glibneee of that whicb ie moet matured. As astringent called catechn, that wonld almost close the mouth of a glass inkstand, is next in order. A couple of onnces of strychnine, next called for, are quickly conveyed to the vest pocket, and a ponnd of white vitriol ie as silently placed in the bottom of the basket. The oil of cognac, the enlphnric acid, and other articlee that give fire and body to the liquid poison, are alwaye kept in store. The mixer buye theee things in various qnartere. They are staples of the art.

The First Electrical Machine in America. A friend of the late Dr. Priestley (Mr. Hugh Bellas) wrote: "In the summer of 1800 I called on Dr. Priestley to retorn some booke I had borrowed, when he told me he had just received a very enrions present from Europe, which he would show me. He took me into his laboratory and pointed to a small pile of plates of silver and zinc, in alternate layere, with pieces of wet flannel and interepersed, each plate about abont the eize and form of a oomm.on playing card. A piece of small wire wae inserted at the top, and another piece near the bottom, and the other ende of the wire were brought together, and there underwent decomposition. 'Now, this is called the pile of Volta,' eaid the doctor, 'and here is the electric fluid deetroying the ende of the wires. Pnt the joint of your thumb to these points and you will feel a slight electric shock. You need not be afraid; it will not be severe.' I did ae he directed, and received snccessive slight shooke upon repeated applications to the pointe." Thia was the first electric machine brought to America.

Dyspeptic Hunger.—If a man is hnngry within an hour, more or lese, after a regular meal, he is dyepeptic beyond qneetion, and it shows that the etomach ie not able to work np what he hae eaten, so as to get nourishment out of it; but, to eat again, and thne impose more work, when it could do nothing for what had already been eaten, is an absurdity; and yet all dyepeptics who eat when they are hungry do this very thing, and thns aggravate and protract their sufferings.

The engraved cylinders for calico printing are required to be of pure copper, and their unsoundness, when cast in the nenal way, wae found to be eo serious an evil that it gave rise to casting the metal under presenre.

Bossin'a indelible ink is made of two parte of powdered acetate of copper, four parts of salammoniac, one part of lampblack, and twenty parts of water, well mixed together. They make a good indelible ink, which, however, mnet alwaye be well shaken before using.

If a person in a house on fire has the presence of mind to apply a wet cloth or handkerchief to the mouth and nostrile, a passage can then be effected through the densest smoke without any serions inconvenience.

Botanical Photography. — Leaves of any kind may be beantifnlly photographed by the following simple procese: Place five cents' worth of bichromate of potash in a two-onnce bottle of plain soda water, and when most of it has been dissolved ponr off some of the clear liquid into a plate and thoronghly ssturate a piece of ordiuary writing paper in it. Then lift ont the paper and allow it to become almost entirely dry in a dark room. Thns your "plate" is prepared. The leaf should then be placed npon the now bright yellow paper, a piece of soft black cloth and several thicknesses of newspaper under the latter, and the whole inclosed between pieces of glass of the same size and held togetber hy clothes-pins. Expose to the snn so that the light will strike foll upon the leaf until the paper has tnrned a deep brown; then take the paper from the frame and put it in clear water, which must be changed every few minntes until the yellow part becomes perfectly white—and the photograph remains.

To Keep Flies From Horses.—M. Perret, a Frenoh pharmaceutical chemist, has discovered a very eimple and economical method of saving horses, particularly when they are not in motion, from being tormented by flies. It consists in merely rnbbing them with a little concentrated oil of lanrel, whicb ie extremely disliked hy the flies. The oil should be especially applied to the parts where the flies nsually settle. With about threepenny worth of thie oil a horse can be anointed for three daye. There is not the slighteet danger in ueing it, and, indeed, its slightly stimulating action ie beneficial to horees, and keepe their coat in good order. The expedient may also be nsefully replaced by a eolution of sixty grammes of asafœdita mixed witb one glass of vinegar and two of water. The strong odor of asafœdita drives away the flies, and, if horses be well washed with thie, not a fly will settle on them. No apprehension need he felt in neing the asafœdita, which hae no deleterione properties.

Strength of Different Materials.—A quarter-inch rod of the best steel will sustain 9,000 pounds before breaking; soft eteel, 7,000 pounds; iron wire, 6,000; iron, 4,000; inferior bar iron, 2,000; cast iron, 1,000 to 3,000; copper wire, 3,000; silver, 2,000; gold, 2,500; tin, 3,000; cast zinc, 160; cast lead, 50; milled lead, 200. Of wood, box and locnst the same size will hold 1,200 ponnds; tougheet ash, 1,000; elm, 800; beech, cedar, white oak, pitch piue, 600; chestnut and maple, 650; poplar, 400. Wood whicn will bear a heavy weight for a minnte or two will break with two-thirds of the force acting a long time. A rod of iron is about ten times as strong as hemp cord. A rope an inoh in diameter will bear about two and a half tone, bnt in practice it is not safe to snbject it to a strain of more than abont one ton. Half an inch in diameter, the strength will be one-quarter as much; a quarter of an inch, one-sixteenth as mnch; and so on.

Sawdust Brandy.—A German chemist has succeeded in making a first-rate brandy out of sawdnat. We are a friend to the temperanoe movement and we want it to succeed, but what chance will it have when a man can take a rip saw aud go out and get drunk with a fence rail? What ie the nse of a prohibitory law if a man is able to make brandy amashes out of the shingles on his roof, or if he can get delerium tremens by drinking the lege of his kitchen table? Yon may shnt an inebriate out of a gin shop, and keep him away from taverns, but when he can become nproarious from boiled sawdust and dessicated windowsills any effort at reform must necessarily be a failure. It will be wise, therefore, if temperance societies will butcher the German chemist before he goes any farther.—*Exchange.*

Dr. Elener statee that the accidental nse in his household of the water which had been employed to boil potatoes for cleansing silverware, led to the nnexpected result that this was much superior in its cleaneing action to the polishing powders so generally employed. It was found that by simply rubbing the article with the fine deposit of potato flour, it took an excellent polish, without the disagreeable necessity of subsequently ueing the brnsh to remove the material, as is necessary where powdere are employed instead.

Marking Tools.—Much tronble can often be eaved by marking tools with their owner'e name, which can be easily done in the following manner: Coat over the tools with a thin layer of wax or hard tallow, by first warming the steel and rubbing on the wax, warm, until it flows, and let it cool. When hard, mark your name through the wax with a graver and apply aqna-fortie (nitric acid); after a few moments wash off the acid thoroughly with water, warm the metal enough to melt the wax, and wipe it off with a soft rag. The lettere will be found etched into the steel.

A Huge Encyclopedia.—A literary ouriosity is now for eale at Peking. It consists of a copy of a gigantic work composed of 6,100 volnmes, entitled "An Imperial Collection of Ancient and Modern Literatnre." This hnge encyclopedia was commenced dnring the reign of the Emperor Kanghe (1662–1722) and was printed at the Imperial printing office, where a complete font of oopper type was cast for the pnrpose.

Sea moss ie enperceding corn in the manufacture of whisky. In Sweden in 1872, there were 105,408 imperial gallone of whisky manufactured from moss, said to be of superior qnality.

Domestic Economy.

Expensive Habits.

A great deal of nonsense is written nowadays abont the expense of living. For instaace, in a schednle taken from a "poor bnt deserving" man'e actoal expenditures for a week, was the item of one pound of coffee, and this man's expenses were held up before the public to show tbat the working class (the very poor of conrse) could hardly live on tho money received. Now, I know people of moderate meaua who live well nod only use one pound of coffee a month, and from my own experience in housekeeping I conclnde the poor man mentioned above has not a New England girl for a wife.

It is because poor people, especially poor men's wives, are ignorant and will not try to learn, that everything they earn ie eaten np. Aside from the rent, it ie cheaper living in New York city than in the inland towne and cities (I speak from experience, having tried both) and if city girls, both rich and poor, would only pay a little more atteation to household dutiee, or, if they were ignoraat when married, would try to learn something afterward, and get up a little enthusiasm over tbeir breakfaets and dinnere, or make the most of everything, instead of moaning and groaning because their precious, lily hands must be soiled a little, we shonld, I believe, hear less about poverty. In every household it ie the wife who can let the money elip throngh her fingers for "necessities," as the husband tbinks, and in not making palatable dishes from what is "left over." If you cannot do this, if you know of nothiug, and can invent nothing but "boarding honee haeh" to make of yonr cold meat, then yon had best break up your home and "be genteel" and board. I have often admired the ingenuity shown by many city women in remodeling and making over their wardrobes, and have often wondered why they did not apply the same skill in the culinary department. Girls of the poor and medinm classes, reared in New York, as a rnle make dreadfully ehiftless honeekeepers. All they seem to think of is a fine dress to their backs and a diamond ring for their fingers, as many of them have, truly.

There are many New England girls here; some of them are rich and some of them are poor; but, go where you will among them, yon will find cleanliness, thrift, economy, and a knowledge of what ie going on in the world around them. They are not afraid of work, and they take pride in a well-ordered house. Somehow their blessed mothere, who may be even now living in comfortable poverty up among the Connectiont hills, have inetilled such habite into them, and have tanght them so much of life and living, that when they marry and have children of their own tbey are prepared to bring them up to be men and women, not fops and fashionable ladies, thank God. Perhaps I, a New England woman, have no right to say thie; bnt I tbink I have, for I have known many of my clan, and I take a just pride in their virtues.

It ie the penny saved more than the penny earned that enriches; it is the sheet turned when the first threads break that wears the longeet; it is the damper closed when the cooking is done that etope the dollare from dropping into the coal bin; it is the lamp or gae tnrned low when not in use that gives you pin money for the month; it is the oare in making the coffee that makes three spoonfule go ae far as a teacupful ordinarily; it is the walking one to six blocke, inetead of taking a oar or omnibus, that adds streugth to yonr body and money to yonr purse; it ie the carefnl mending of each week'e wash that gives ease to your conscience and length of days to your garmente; and last of all, it is the constant care exercised over every part of your honsehold, and constant endeavor to improve and apply your powers to your work that alone give peace and prosperity to yonr family.—*Springfield Republican.*

Are you fond of your coffee? An official investigatiou has just been made in Paris as to the materials of which this "delicione beverage" is made. There are five principal compounds:

1—Burned bread and coffee grounds.
2—Powdered chiccory, sand and brick dust.
3—Chiccory and burned bones.
4—Chiccory burned, mixed with butter and colored with Prnesian red.
5—Burned cabbage roots and boiled horse liver.

Baked Indian Pudding.—Boil one quart of milk, and while boiling stir in corn meal till quite thick and well scalded; sweeten with molasses to taste, say one cup. Pnt in a baking dish, pour on one quart of cold milk, drop several pieces of bntter on as many points, add salt, and pnt in the oven and bake from one and a half to two hours. A little experience will get it just right. This pudding has the merit of cheapness ae well as ease of making, and great excellence; eaten without sance, and cold or hot.

Soup Balls.—Take one pint of sweet milk; when boiling hot stir in dry flour nntil it ie etiff. When cool add one egg and enongh flonr to allow you to form it into balls; add a pinch of salt. About ten minutes before serving yonr eonp drop the balls in; they will be very light and will not fall after being lifted.

MINING AND SCIENTIFIC PRESS.

W. B. EWER.....SENIOR EDITOR.

DEWEY & CO., Publishers.

W. B. EWER, JNO. L. BOONE

Office, No. 224 Sansome St., S. E. Corner of California St., San Francisco.

SUBSCRIPTION AND ADVERTISING RATES.

SUBSCRIPTIONS payable in advance—For one year $4; six months, $2.25; three months, $1.25. Clubs of ten names or more $3 each per annum. $5, in advance, will pay for one and one-third year. Remittances by registered letters or P. O. orders at our risk

ADVERTISING RATES.—1 week.	1 month.	3 months.	1 year.
Per line.....	.25	.80	$2.00	$5.00
One-half inch.....	$1.00	3.00	7.50	24.00
One inch.....	2.00	5.00	14.00	40.00

Large advertisements at favorable rates. Special or reading notices, legal advertisements, notices appearing in extraordinary type or in peculiar parts of the paper, inserted at special rates.

We Will Prepay All Postage

On this paper after the 1st of January, 1875, as the law demands. This is equivalent to reducing the subscription price 20 cents per annum. Besides, it will save subscribers the annoyance of paying petty postage bills every quarter.

San Francisco:
Saturday Morning, Nov. 21, 1874

TABLE OF CONTENTS.

EDITORIALS AND GENERAL NEWS.—Illuminating Tiles; Academy of Sciences, 321. Panamint Mining District; Natural Curiosities in the Sierras; Hydraulic Mining; Thanksgiving; The Lick Sale, 228. A Rational Want, 239. Oaklanders' Local Option Memorial, 332. Attempted Suicide; California's Poet; Cheap Living; Germans and the Pope; Great Earthquake in Chili; Austria and Prussia; Resumption of Specie Payment; Pennsylvania Mine Troubles; A Gift from Geo. Francis Train; Terrible Steamboat Calamity; Pacific Coast Postal Changes; Carlistism Crushed; Warlike Villainous Saltpeter; Immoral Chinese Women; Become an Honest Man; Coal Oil Lamp Explosion; Frightful Railroad Accident in Italy, 232

ILLUSTRATIONS.—Haskin's Semi-Portable Steam Engine, 321. Preservation of Fruit for Winter, 329.

MECHANICAL PROGRESS. — Glass Lined Tanks and Cisterns; A Striking Sundial; Ironclad Vessels; Improvement in Saws; Cane Fiber for Felt; Sand Paper; Silent Fan-Blowers and Exhausters; An Ingenious Invention; Instantaneous Extinguishment of Street Lamps; Alloys of Iron with Manganese; Glycerine Instead of Steam; A New Compound of Iron; Ancient Use of Concrete; Utilizing Waste; A Monster American Locomotive, 323.

SCIENTIFIC PROGRESS.—American Weather Forecasts; Rusting of Iron; Effect of Hydrogen in Impairing the Tenacity of Iron; The Occlusion of Hydrogen in Iron; Density of Hydrogen in Combination; Effect of Heat on Germination; Luminous Apparitions or False Lights; Absorption of Gases by Iron; The Microscope, 323.

MINING STOCK MARKET.—Thursday's Sales at the San Francisco Stock Board; Notices of Assessments; Meetings and Dividends; Review of Stock Market for the Week, 324.

MINING SUMMARY.—From various counties in California, Nevada, Arizona and Montana, 325.

GOOD HEALTH.—Transfusion of Blood; The Pulse; Breathing Through the Nose; Amputating the Tongue; Infanticide by Opium, 327.

USEFUL INFORMATION. — How Bar Room Liquors are Made; The First Electrical Machine in America; Dyspeptic Hunger; Botanical Photography; To Keep Flies from Horses; Strength of Different Materials; Sawdust Brandy; Marking Tools; A Huge Encyclopedia, 327.

DOMESTIC ECONOMY. — Expensive Habits; Baked Indian Pudding; Soup Balls, 327.

MISCELLANEOUS.—Treatment of Lead by Steam; Mining Prospects on the Comstock; Saver of Fuel; Owners of the Pine Flat Quicksilver Mines; A Miner in Luck; How Miners Brave the Perils of the Lower Levels, 322. The American Beverage; Curiosities of Ventilation—The Belcher Air Shaft; Going for the Bottomless Pit; Copper at Spenceville; Eastern Nevada Mines; Chloral Hydrate for Horses; McGanney et. al vs. Blue Point Mining Company; Union Gravel, 326. Seed Time in California; Healing Power of Glue; Lincoln Coal; Soft Ground, 330. Large Profits from Low Grade Ores; Rich Strike; Mining Decision, 334. Sierra County Quartz Mines; Successful Blast, 335.

Thanksgiving.

Between the present and the next issue of our paper the day of annual thanksgiving occurs; the proclamation of Governor Booth having appointed Thursday November 26th for this purpose. Never did the people of California have greater cause for rendering thanks. There have undoubtedly been years in which the people of this State have made more money than in the year now drawing to a close; but never were the substantial blessings of Providence more bountifully bestowed than during the year 1874. The year has brought with it no public disasters; California being as isolated from her sister States in this respect as she is in her geographical position; while everything conducive to health, abundance and general prosperity, has been granted in profusion. While we give thanks for these blessings let us see that they are made available by us to their fullest capacity to secure intellectual progress and social improvement.

The Governor in his proclamation calls upon the people "to abstain, so far as practicable, from their ordinary secular pursuits on said day; to assemble during some portion of it in their respective places of public worship, and by appropriate religious exercises manifest their gratitude to the Almighty for the blessings of the year, and their sense of dependence upon His will; and that they devote the residue thereof to family and friendly reunions, to innocent enjoyment, generous hospitality, and the kindly remembrance of the poor and the afflicted."

The Panamint Mines.

Just at present the eyes of the prospectors of the coast are turned toward Panamint district, Inyo county, California, and by next spring it is probable that large numbers of miners will find out personally what the camp amounts to. Very heavy capitalists have invested in the mines there and have given the place a sudden start and notoriety. We examined this week a lot of ore from Panemint, and had a conversation with a practical miner just from there, from whom we obtained some facts of interest to other practical miners. Leaving aside all descriptions of particular mines, etc., we will tell our readers just what they perhaps want to know.

In the first place, "how to get there?". You can leave this city on a coast steamer for Los Angeles, and then go to Panamint by team, stage, or "a foot;" or you can go to Bakersfield by rail and then stage it. Our practical friend who has been both ways, says the last mentioned route is the better one. Take the cars which leave Oakland wharf, connecting with the 4 P. M. boat from this city, and go to Latrop. There change cars to Bakersfield, Time from San Francisco 18 hours. Then take the stages for Panamint; time, 40 hours. Through tickets by this route are $60, which our friend says is cheaper than paying your way "piece meal." By leaving this city Monday, Wednesday and Friday, straight connection can be made, as the stages leave Bakersfield Tuesdays, Thursdays and Saturdays. Of course, meals are not included in the $60 ticket.

The mines are in a mountainous, rocky region, at an elevation of about 7,000 feet. No houses of any pretentions have yet been put up in the town. The ore is quartz, containing silver, copper, some lead and a little gold. It assays all the way from $100 to $3,000 per ton. The ore is shipped from Panemint to Liverpool for reduction, as it is rebellious, and there are no reduction works yet erected. It costs to ship the ore from the mines by team to Spadra, the terminus of the railroad, 28 miles from Los Angeles, $30 per ton. From there the Pacific Mail Steamship Company take it to Liverpool for $25 per ton of 2,000 pounds, making the total freight $55 per ton. It is mined and sacked for about $15 per ton, as the ledges are wide and large. The ores contain from 10 to 30 per cent. copper, so by shipping it to Liverpool the miners get from $15 to $45 per ton for the copper alone. If worked here, this of course would be lost, while by shipping, it nearly pays the freight.

Small lots of the ore have been milled, but practical men do not think it can be milled closer than 60 per cent. There is a good deal of lead in spots, and this with the copper makes it difficult to work. A five-stamp mill is now up at the mines, and a 20-stamp mill is now on the way there. The place where reduction works will eventually be put up is at Panamint valley, about 8 miles on a down grade from the mines. At that place there is plenty of hot and cold water, and beds of salt from one to twenty feet thick. It is expected that the Los Angeles and Independence narrow gauge railroad will pass through the valley, to Waucoba, Cerro Gordo, Walker's lake, and other mining districts. There are now from 1,200 to 1,500 men in the district, and the roads are lined with teams going in. Everybody is flush, gambling is in its zenith, and the camp looks like a California or Nevada camp in early days.

Lumber is worth $180 per thousand at Panamint. It is hauled from Tehachapei, Holcombe valley, and Los Angeles. At Los Angeles they are fitting up houses which are shipped right to the mines. There is plenty of timber there for mining purposes and fuel, but none for building. The 20-stamp mill sent there had all the timbers, etc., prepared before it was shipped. Miners' wages are $4 per day. Bacon is 50 cents per pound, and flour $10 per hundred. Hay and barley are equally high, both bringing eight cents per pound. The high freights, of course, make prices high, but next year they will come down.

A newspaper is to be started immediately in the new district, and everything looks now as if the camp would become in the spring the liveliest outside of Virginia, on the coast. If the present excitement keeps up, however, it will probably be over-crowded, as is usually the case. There are hundreds of ledges in the mountains, some ten or fifteen of which are what may be considered first-class ones. The capitalists who have put their money into the camp are doing all they can to develop it, and will have to put even more in before they begin to get any returns. The ore which we saw at the sampling works was certainly very rich, and such as would make any old miner's eyes sparkle. Everybody in Panemint has high hopes of the camp, and prophesies that it will be a second Washoe. It is late in the season to do much now, as the mountains are so elevated that they will probably have considerable snow; but we are told that the mines can be worked all winter. Prospectors, however, will have rough times of it.

Natural Curiosities in the Sierra.

Several natural phenomena have lately been discovered in the Sierra Nevada mountains, which will add to the attractions already existing. Prominent among them is the recent volcano discovered by Dr. Harkness in Plumas county, a description of which is given in another column. This is particularly interesting as the only one discovered here bearing authentic marks of having been in eruption within the last 20 or 30 years. "Recent volcanoes" are plenty enough, for there are hundreds of places to be found where the craters can be seen and the lava looks fresh, and recent. Still the presence of large trees grassy slopes, etc., show that many years have passed since volcanic activity prevailed. In the instance mentioned Dr. Harkness details minutely the evidences which he found, to prove that the volcano was very recently active. The boiling lake he refers to is also an object of interest; but we are afraid that if there was much of a population in the vicinity, some enterprising Chinamen would take possession and start their wash-houses on its borders.

Another quite remarkable phenomenon, which we do not think has been before described, is an immense natural tunnel through the mountains in the southern part of Sierra county. During a recent trip in that vicinity Charles W. Hendel, the well-known Deputy U. S. Mineral Surveyor of the county, Mr. Gibson, of Scales Diggings, and W. A. Skidmore, of this city, Deputy of the U.S. Mining Commissioner, observed a natural tunnel of great dimensions through a high crest of the Sierra, apparently near the boundary line of Sierra and Plumas county. Mr. Skidmore tells us that his point of observation was on the Forest City and Downieville trail, 1½ miles north of Forest City, and about one mile south of the old mining camp of Rock creek. While scanning with a field glass a high and precipitous range on the verge of the horizon, distant 12 or 15 miles to the northeast of their position, Mr. Skidmore distinctly observed a tunnel running through the ridge. His companions readily observed it with the naked eye. By means of an aneroid barometer and leveling glass they estimated the altitude of the range to be about 6,500 feet above sea level, and the tunnel about 500 or 600 feet lower than the summit of the range.

Between them and the range lay the great gorge of the North Yuba, 3,000 ft. in depth. North of this gorge they could distinctly trace the various tributaries of the North Yuba. The tunnel was situated near the head of the principal of these streams, (probably Rattlesnake creek), and about 12 or 15 miles east of Fir Cap mountain. The site of the tunnel was apparently inaccessible from the south side, or North Yuba slope of the range. From their point of observation, although distant only 12 or 15 miles in an air line, it would have required a journey of two or three days to reach it. If explored it must be approached from Fir Cap mountain on the west or from the vicinity of Gold lake on the east, by following the trend of the range.

The range through which the tunnel passes is of volcanic origin, with precipitous sides. Near the location of the tunnel the range falls off in a sheer precipice, at least 1,000 feet in depth. From the standpoint of the gentlemen referred to, the tunnel, Mr. Skidmore says, seemed as large as an ordinary railroad tunnel. Therefore it could not have been less, making allowance for distance, than 100 feet in hight. They had no data for estimating its length. Mr. Hendel had several years previously observed the same tunnel from a high range in Plumas county, his view being the north slope of the range while this time it was observed from the south. It is hardly probable that this remarkable tunnel will remain long unexplored.

On the same trip in which Dr. Harkness found the extinct volcano above referred to he found a lake which had been previously visited only by a few hunters. It is situated in the midst of mountains of very high altitude which flank Warner's valley on the north and Big Meadow upon the west. The lake is on a general outline of triangular shape and the Dr. estimated its two largest diameters at one mile and three quarters, the whole size being nearly that of Donner lake. The barometer registered an altitude of 7,330 feet above sea level, which makes, we believe, the most elevated of any considerable body of water in the United States. No signs of life were found except on the northern shore, where the doctor discovered a colony of red Cyclops. The waters in August were intensely cold and of a deep blue color. The mountains rise abruptly from the water, and are of volcanic origin; one on the south which the doctor ascended had three craters upon and near its summit. The surplus water finds an outlet from the southern extremity into Warner valley over a steep declivity of over 2,000 feet. At this outlet several varieties of fresh water algæ were found. As this lake was comparatively unknown Dr. Harkness named it "Lake Livingstone," but the California Academy of Sciences, to which the doctor communicated these facts, have taken the liberty of calling it "Lake Harkness."

Some of our interior counties have never been thoroughly explored, and it is to be hoped that discoveries of the nature spoken of above will encourage others to make explorations near home, before they attempt to hunt up wonders in other countries.

The Lick Sale.

The greater part of the estate of James Lick deeded for various charitable and useful purposes, to certain Trustees, was disposed of at public auction on Tuesday last. The aggregate amount brought was $1,999,385. Catalina island, worth between $1,000,000 and $2,000,000 and several other pieces of property, were withdrawn from the sale, and will be sold in about two months. The Lick House in this city, brought $920,000, but the sale has not yet been confirmed by the Trustees, as they think they can get a better price for it.

The specified donations in the deed of trust executed by James Lick are listed as follows: Sierra Nevada Observatory, $700,000; School of Mechanical Arts, $300,000; Sacramento Art Monument, $250,000; San Francisco Art Monument, $150,000; San Francisco Free Baths, $150,000; San Francisco Old Ladies' Home, $100,000; San Francisco Protestant Orphan Asylum, $25,000; San Jose Orphan Asylum, $25,000; Ladies' Protection and Relief Society, $25,000; Mechanics' Institute Library, $10,000; Society for Prevention of Cruelty to Animals, $10,000; For monuments to deceased relatives, $20,000; For cash gifts to relatives, $21,000. Total, $1,776,000.

The beneficiaries, after the observatories and free baths, are mentioned in this order: 1st, San Francisco Orphan Asylum; 2d, San Jose Orphan Asylum; 3d, Ladies' Protection and Relief Association; 4th, Mechanics' Institute Library; 5th, Prevention of Cruelty to Animals, 6th, Monuments to relatives; 7th, Old Ladies' Home; 8th, San Francisco Art Monument; 9th, State Capitol Art Monument; 10th, School of Mechanic Arts; and 11th, gifts to Mr. Lick's relatives. The surplus receipts of the sale, after deducting the amounts named in the specific donations, are to be equally divided between the California Academy of Sciences and the Society of California Pioneers. These cash gifts are not to be confounded with the valuable lots already deeded to the societies just named, as Mr. Lick has already presented them both with a lot each, on which to erect their buildings. A handsome sum will therefore be divided between them. How much it will be can not be told until the remainder of the property is sold.

By the terms of the sale, the sum of $250,000 will be realized in interest money, which will go to swell the share of the Pioneers and Academy of Sciences. A great deal of interest was manifested in the sale, the hall being crowded with bidders and spectators. The spectacle of a very rich man giving away all his property was such a strange one that the matter formed the chief topic of conversation on the streets this week. Almost every one has some way in which they could have given the money away to better purpose than Mr. Lick, but we opine that few of them would give it if they had it. Mr. Lick's noble generosity is fully appreciated by all but narrow-minded people, and he has done an act which will throw a luster around his name forever.

Hydraulic Mining.

Perhaps no class of mining is so little understood by the general public as hydraulic mining. They have a general idea that a big stream of water is turned against a bank of earth and that by some peculiar process this stream breaks down the bank, picks out the gold and carries off the debris. The details of the operation are little understood even by quartz miners. The method of arranging and working the pipe, sluices, under-currents, etc., has never been described except in general terms. This class of mining is very interesting in its details, and although many miners of course understand it thoroughly, few have ever taken the trouble to write down the facts gained by experience for the benefit of others. Data or the subject of heavy heads of water under high pressure, large pipe, etc., cannot be conveniently reached for this reason; none of the engineers' books treat of the subject to suit our necessities. We use water in our hydraulic mines in such quantities and under such circumstances that a special treatise on the subject is needed by every hydraulic miner. We intend in our next issue commencing a series of illustrated articles on hydraulic mining which will be of great value. The article was written by a practical hydraulic miner, of many years experience and the whole series will be well worth preserving. These articles will not only be of value to miners themselves but as a matter of reference for the general reader. We have had the engravings all prepared and give this notice so that our readers will be careful to preserve the whole series.

Preservation of Fruit for Winter.

A sufficiency of the fruit product of California is now an assured fact, and our producers are doing all that could be asked of them in regard to extending and improving varieties. The great desideratum at present, is a system by which our surplus fruit may be prepared for distant markets and be made available for home consumption during all seasons of the year. To accomplish this object we have, as the readers of the PRESS are aware, labored without stint. As another effort in this direction, we give the following communication by C. H. Dwinello:

In this year of abundant and exceptionally fine fruit, we doubt not that many are wishing for some means of preserving it in its natural beauty and perfection beyond the time which it usually lasts. Even the large growers and dealers have, to a surprising extent, neglected this most important part of their business, and thereby failed to reap what should be their richest harvest, in selling fine fruit out of its seasonal season.

We purpose in this article to call attention to some of the methods used in this and other countries for preserving fruit and vegetables in their natural state.

By far the simplest way of keeping apples and pears for the Christmas market is to gather them in long piles upon the bare ground, between the orchard rows, and leaving them exposed to the elements. This seems, at first sight, a very careless way of doing business, but it is practised to a large extent by some of our most successful fruit growers. They say that the loss is less than when the fruit is stored in a close building, in the Eastern fashion, and that it does not shrivel up and become corky and tasteless. We know that in this way some of our late pears and apples can be brought into fine order for eating about the last of December. The time of keeping could probably be lengthened by making a light bed of straw for the fruit to lie upon, and sheltering it from the sun and rain without shutting out the air.

Packing in Sand

Costs more trouble than the above plan, and is also more effectual. The sand should be clean, and neither very moist nor very dry. Take any ordinary fruit-box, and begin at the bottom with a layer of sand, say an inch thick; then put in a layer of apples, taking care that they do not touch each other, nor the sides of the box; fill up all spaces, and cover the apples with sand and proceed as before until the box is full, placing the apples in the upper layers so that they may rest upon the sand-spaces between the rows, and not directly upon the apples below them.

We have eaten apples in February that are usually soft in October that had been put up in this way, and their only fault was that they were too hard to eat without being exposed to the air to become mellow. It is reported that a gentleman in Santa Cruz accidently left a box of apples, packed in sand, in his storehouse until this autumn, a year from the time of picking, and found them in perfect order.

This system is recommended for apples and pears, and could doubtless be used for some other kinds of fruit and vegetables. Sugar beet tops are kept for months in trenches, covered with earth to a considerable depth, and come out a dainty food for cattle in time of scarcity.

Of course, only the best of fruit should be packed and that should be picked before it softens at all, and handled with the greatest care. The boxes should be stored in a cool, dry, well-ventilated room—best of all a good cellar.

Grapes for Winter and Spring

Can be preserved at a small expense. In western New York the Isabella is kept in fine order by wrapping each bunch in paper, and then packing in a dry room where there is no danger of freezing nor heating. Care should be taken not to have the layers so thick as to crush the lower ones. The wrapping in paper can be done very quickly. Tear old newspapers into pieces of the right size, twist each piece into a rude cornucopia, place a cluster of grapes in this receptacle, gather the loose ends of paper and twist them tightly together and the work is done.

Hanging Grapes

Is much practised in some places. It is recommended that the clusters be suspended from near the tip, reversing the natural position. This causes the berries to fall back from the stem and separate from each other, thus decreasing the danger of rotting. It is easy to erect cheap frames in a fruit-room, with small hooks of flexible wire at suitable distances for attaching the clusters. A very economical and cheap rack can be made by fastening a rope to a timber or hook in the ceiling and again to the floor, so that it is in a perpendicular position, —see fig. 2. About this, hoops are suspended one above another, by means of strong cords tied to the hoops and coming to a common center on the rope.

Thomery and Ferrieres.

In France, are celebrated for their fine grapes, and the cultivators there have reduced nearly every detail of their management to a scientific nicety. They cut their grapes with a portion of the branch attached, (see fig. 4); this branch is placed in a small bottle filled with water, with a neck just large enough to admit it. The bottles are then placed in racks (see figs. 3 and 4) just far enough apart to prevent the clusters from touching. They should be looked at occasionally and if necessary replenished with water. Some advise putting a little charcoal into each bottle to keep the water sweet, but others claim equal success without this precaution.

There are two methods of securing the bottles on the racks. At Thomery the horizontal bars in the racks are made of narrow boards, with deep notches cut on each side, just large enough to admit the neck of the bottle, which is supported by the rim about its mouth.

At Ferrieres the bottles are supported between two strips of wood, about what would here be called heavy battens, which are kept an inch and a half apart by means of pieces of wood at each end. In the inner batten incisions are made for the bottoms of the bottles to rest in, and corresponding notches are cut in the outer ones. The grapes are cut in October and preserved in good condition until April.

Fig. 1.

Interior of Grape Room in Ferrieres, France.

The adoption of the above method at Thomery, immediately added $20,000 to $30,000 to the value of the annual grape crop of that village. Grapes hung in this way require less care than by the preceding plan. Any room in a well built house may be used, if the light is shut out and proper ventilation secured.

Careful Handling of Grapes

That are to be kept in their natural state, is of course absolutely necessary. None should be broken or loosened on the stem, and all imperfect berries should be removed with grape scissors.

Those who do not wish to take the trouble involved in any of the ways already described, may prolong the grape season several weeks by packing in clean, dry chaff, or even corn husks.

Fig. 3.

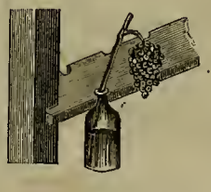

Fig. 5.

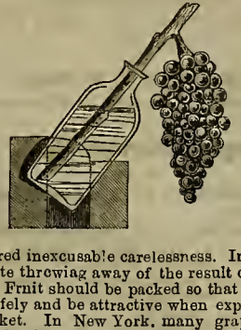
Preparing Grapes for Market

Is certainly not the least important part of the producer's work. To ship fine grapes in large, coarse boxes, as is done in California to so large an extent, would in France or New York be considered inexcusable carelessness. In fact, a deliberate throwing away of the result of one's labors. Fruit should be packed so that it will carry safely and be attractive when exposed in the market. In New York, many grapes are sent in circular paste-board boxes, holding from three to six pounds, which are filled as full as possible, so that there can be no moving about. These boxes are in turn put up in larger wooden ones for shipping. There is very little danger of grapes crushing under their own weight when packed this way, particularly if the smaller size of boxes is used.

Fig. 4.



It is to be hoped that our California growers will get into the habit of storing more of their fruit then they have done, so as to relieve the autumn market, and have some to sell when it is worth a good price.

A Rational Want.

Every advanced stage in agricultural progress develops wants which were not recognized in the preceding stage; so that it may be said of Dame Agriculture, as of all the rest of us—the more she has the more she wants. The last quarter century has furnished a liberal supply of improvements in agricultural implements, but it leaves some wants unsupplied, which have existed for a long time; and has created others, which have really grown out of its own improvements. Some of these wants are urgent; among the most prominent of which we would mention a steam plow, adapted to farming on a small as well as on a large scale and a successful potato-digger possessing the same adaptability; and we have the same faith that these wants will be fully supplied in due time as we have that the seasons of plowing and potato-digging will come in their time.

But there are other needs growing out of our progressive economy which have not as yet assumed the form of definite wants. We have met with an expression of such a desire in an Eastern agricultural paper, under the head "Machine Wanted." The implement or machine called for is one by which Indian corn—including stalks, leaves cobs and grain—can be reduced, by grinding all together, to food for stock. This, it occurs to us, is a rational want. Corn stalks are of themselves healthful and somewhat nourishing food; but they need cutting and steaming to make cattle take to them properly and eat them clean; while the shelled corn is of itself extremely valuable to nearly all kinds of stock, but with some it is indigestible when eaten alone, and can scarcely be considered as perfectly healthful to any.

In localities where corn is abundant, an excellent feed for horses is made by grinding the cob with the grain. It is known that the cob yields only a very small percentage of the nutrition which this feed supplies; still it is not entirely destitute of this quality, and furnishes, besides, an acid ingredient to the food which aids materially in digestion, and also does away with the objectionable quality of compactness which the pure meal possesses. This fruishes

Fig 2.

a healthy, hearty feed, even for the working horse; and if we could add to this the leaves and stalks, cut close to the ground in the ordinary way to shock, it would supply a large amount of food of a desirable character. The tastefulness of the meal of the grain and cob would permeate the fibrous mass, and cause it to be eaten with a relish, thus preventing waste; while this coarse ingredient would produce the requisite distention of the animal's stomach, and give an assimilative and digestible character to the whole.

For dairy cows in winter, for mostly all kinds of young stock, and for working oxen, it would, no doubt, become a satisfying food, and be extremely economical to the owners of such stock. To the "skinflint" class of farmers a temptation would be offered, possibly, to "scrimp," by substracting a portion of the ears from the shock; and the slovenly might think that there would not be that necessity for the perfect ear that the corn of commerce demands; and would accordingly slight the cultivation of the crop; but for this purpose, as for all others, the crop should be cultivated up to its fullest capacity, and no scrimping allowed.

Two Montana men claim to have discovered an inexhaustible ledge of pure white marble not far from Deer Lodge, and easy of access. It is harder than the average Italian marble, is very even grained, and free from flint, looks like pure white wax, without streaks, and by rude process takes a fine polish.

A Recent Volcano in Plumas County.

At the meeting before last of the Academy of Science, Dr. H. W. Harkness made some remarks of a recent volcano in Plumas county, which he was requested to write out in full. Dr. Harkness has written the following account of his visit to this volcano, which he has allowed us to publish. What are called "recent volcanoes" are plenty enough in this State, but this is the only instance we remember where the surroundings and circumstances are such as to *prove* that the volcano was in active operation within twenty-five years.

From time to time during the period between the years 1850 and 1854, vague rumors had been circulated that evidence of active volcanic action existed in the northern portion of Plumas county, and that strange lights had been seen apparently by different observers, which were referred to by them as the result of an eruption then in progress somewhere to the eastward or Lassen's Butte. As the Indians in the immediate vicinity were exceedingly hostile no effort appears to have been made to verify the correctness of these reports, and the subject seems to have dropped from the minds of men.

While traveling in Plumas county during the past summer, I heard reports of the existence of a lava bed in the vicinity of Lassen, which bore traces of a recent upheaval. The central point of this disturbance being commonly referred to as the Cinder Cone. While camping in the neighborhood, I had ample opportunity to make a pretty thorough examination of the locality.

This cone is marked upon the map as being within the limits of Lassen county. This, however, is a mistake, its true location being at a point which would place the whole, or at least the larger portion of the cone, with its outlying lava bed within the limits of Plumas.

Two lakes are laid down upon the State Geological map as lakes Anna and Lonisa; these lakes lie to the eastward and about twelve miles distant from Lassen's Butte, and are known to the residents in that portion of the State as Snag lake (Anna) and Juniper lake, (Louisa). The Cinder Cone and lava bed which I refer to, lying directly across the northern end of Snag lake.

When viewed from the upper end of the lake—1½ miles distant—the lava bank rises directly from the water to the height of 80 or 90 feet, and extends across the whole breadth for a mile or more, with as regular a gradient and as sharp a definition as a railway embankment.

The surface beyond being studded with a few abrupt elevations of 20 or 30 feet high, while to the left rises a huge cone with a crater at its summit. On the eastern end this lava embankment turns abruptly to the north as it strikes the lake shore, and from this point the line extends in a northerly direction for a distance of one and a half miles, or more, when it strikes another lake, or ae is most likely, what was once the lower end of Snag lake. At this point the line turns sharply to the west, the lava dyke crossing the lake to its western shore, when it again deviates to the southwest, until it strikes the lake line previously described. Nearly midway, on the western side the Cinder cone arises abruptly from the border of the lava bed, one side of it resting upon the plain. It will be seen that should my estimate prove to be correct, the entire circumference of the lava bed is between four and five miles for the entire distance, except at the cone, the embankment rises from the plain or water 80 or 90 feet, at a sharp angle of about 60 degrees, and in no instance is there in this border the slightest trace of a lava flow to indicate that it was in a molten state when thrown out.

The surface of the blocks show a bright metallic luster, the colors varying in different parts of the field from black to a reddish brown. On climbing to the surface of the lava it is found to be very irregular, with ridges and depressions alternately, forming a surface so uneven as to make it very fatiguing to walk for any distance upon it. Near the center of the field, I observed a mass of lava which showed signs of having been in a molten state when thrown upon the surface; this was a somewhat narrow strip, a hundred feet or so in length, lying in a horizontal position, but slightly broken, and its rough, uneven, corrugated surface, clearly indicating that it had been cooled by contact with the atmosphere. A few sickly looking pine trees—a dozen or two at the most, were struggling for existence, wherever a little collection of burnt earth rendered such an existence possible. These trees were quite small, being only two or three inches in diameter.

As I before stated the cone rises from the western side of the field. In making the ascent I selected a point to the southeast of the cone, as the side there rests against the lava and its level of a hundred feet can be reached

[Continued on Page 332.]

Seed Time in California.

Anyone emharking in agricultural pursnite, no matter what country or what district he may be in, will miee the traditional regularity of "seed-time and harvest," and of many other matters connected with the farmere' oalling. The irregularity of the seasons in California—of seed-time especially—and the great diversity of soil and climate here, have heen amply dilated npon. Prohably the eubject has heeu amplified a little too mnch; and the contrast hetween California and Eaetern farming, as regarde certainty and regularity, oertainly ie carried to a point which the facts in the case will not warrant.

The variations in the seed-time in the Eestern States are reckoned hy days; whereas with us they range hy weeks; but we should oonsider that, owing to the comparative length of the growing seaeon in the two localities, a day with them is of ae mnch consequence as a week with us. When we hear ahout the farmers there always getting in a certain crop from the firet to the tenth of any month, we might he led to admire the regularity of the system, if we did not know that the eeed could not poesibly he pnt in hefore the firet of that month and that the crop wonld not mature if it were put in after the tenth.

The seed-time of California may he said to extend throughont the year in what is known as the agricnltural portions of the State. The gronnd is even now heing prepared for seeding with

Wheat, Barley, Oats and Rye,

The recent nuseasonable rains having acceler-ated the plowing eeaeon. Good farming—and we have more good farming here than we get oredit with—doee not neglect to eteal a march on the planting season whenever this can he done. As a general rule the grain is sown as early in the season as the condition of the soil will permit. Reports from the crops of the last eeaeon are in favor of late sown grain; this however was an exceptional inetance, and heing so considered hy farmere will prohably heve no influence in their future course. In following the course of grain sowing in this State we are not to he guided hy geographical rules, hut hy the supply of water, natural or artificial, upon which the sectione of country may depend. The capacity of soil to retain ite wintry supply of moieture will, of oonrse, influence to eome extent the farmer in hie choice of eeed-time; hut the main ooneideration is the eummer supply of water obtainahle. Where irrigating facilitiee exiet, or where neighhoring mountaine supply the eurronnding valleye with moisture hy eeepage, or the district is henefitted hy fogs from the sea coast, the necessity for early seeding is not eo nrgent; hnt where these resources are wanting, and the soil hecomee dry in early snmmer, then early sowing is indiepensable.

Potaloes

Of the Humboldt ahd other varieties for general use shonld he planted at once, in order to have their growth accelerated ae much as poesihle by aid of the winter raine—thus ohtaining the nse of the land for the second crop—at an early period in the coming seaeon. In localitiee where the soil driee out early in eummer, the Early Rose and other early varieties are also planted about this time.

In localitiee visited hy spring frosts the planting of

Indian Corn

Ie of course delayed until after the period when these are to he expected; still early planting is deeirahle, in order to have it attain as much growth ae poesihle, hefore the dry season fairly sets in. Rapid growth is essential in corn growing, and this ie materially aided hy warm nights. In some of the heet corn-producing portions of America, planting can not he done before the 10th of May; and nippiug frosts may he expected ahont as early in September, yet within these four months it attaine perfect maturity; hut thie it could not accomplish if its growth were even partially suspended at night. Where the nights are hot and sultry, accompanied hy copious dews, it attains, prohably, a larger portion of ite growth at that time than hy day; the rapidity of thie growth aleo aiding the plante in eecaping the ravagee of worms. Our most snccessful corn growers seem to prefer to plant quite early in April.

The same precantions against frost that govern the planting of corn, are nsed in planting

The Bean Crop.

But where no frosts are to he expected this crop may he put in as eoon ae the ground can he got ready; or planting may he delayed until spring where moieture may he relied upon during the growing seaeon. The planting of tomatoes ie governed hy the same rulee. Cahhages are planted at any and all times, snhject only to the eupply of moietnre to he expected.

There are varioue methods practiced in this State in growing

The Onion Crop.

Thoee engaged most extensively in thie hueiness grow them from seed. Some practice the transplanting method; constructing heds of very rich, finely pulverized eoil in the fall, and in theee they sow the seed at once, very closely; eometimee in drills and eometimes broadcast. Ae eoon as the young onion hegine to hulh they are transplanted to the field. Where transplanting is not practiced the eowing ie delayed until the latter part of winter, when the eeed is sown in drills. People here prefer a mild onion to a strong one; consequently the red onion is not much cnltivated. The yellow Danvere is the leading variety; next to thie come the yellow and the white Silverekins. A good many top or "hntton" onions are grown here. In growing

The Beet Crop,

Especially the engar heet, it is extremely important to eeonre a nniform growth. On land that ie snhject to overflowing, or that retaine a surplue of water, any crop growing thereon is necessarily retarded in its growth, and a suspeneion of growth is injurions to crops generally, and particnlarly heete. If they are stopped in their growth, even for a few daye, they are injured permanently. Vegetable life cannot remain stationary any more than animal life. With the stoppage of growth, even temporarily, the maturing process commencee, and it will he found that where heete have etopped growing from a surplus or lack of moisture, or from any other cauee, when theee causes have heen removed and the growth is resumed, they will he inclined to send forth eeed etalke; ehowing that the maturing elements had heen called into requisition during the hrief suspension of growth, and even though the tendency to go to seed may he removed, and the enhseqnent growth all that conld he desired, the vegetable will he imperfect in conseqnence of the fiher of the previous growth heing herdened. In growing heets for stock this is of less conseqnence; and in many placee they are sown in the fall for thie pnrpoee; hnt it is only in localitiee particnlarly favored that the reqnisite growth for sugar heete can he ohtained except hy sowing in the spring.

Healing Powee of Glue.--Many workmen do not know that glue as a healing remedy ie invalnahle. For the last twelve or fourteen years, says a mechanic, I have heen employed in a shop where there are over three hundred men at work; and, ae ie the caee in all ehops of thie kind, hardly a day paesee but one or more of us cut or hrniee our limhs. At first there were but few who found their way to my department to have their wounds hound np; hut after a while it hecame generally known that a rag glued on a flesh wound was not only a speedy curative hut a formidahle protection against further injury. I was obliged to keep a fnll supply of rage on hand to he ready for any emergency. I will here cite one among many of the cases cured with glue. A man wae ruuning a horing machine with an inch and a-quarter auger attsched; hy some means the sleeve of hie ehirt ceught in the auger, bringing his wrist in oontact with the hit, tearing the fleeh among the muecles in a frightful mauner. He was conducted to my apartment, (the pattern shop), and I washed the wound in warm water, and gined around it a cloth which when dry eunk into a rounded shape, holding the wound tight and firm. Once or twice a week for three or weeke, I dressed the wonnd afreeh nntil it wae well. The man never lost an hour's time in conseqneuce. The truth of thie statement hundreds can teetify to. I used, of couree, the hest quality of glue.

The Santa Rosa *Democrat* saye the Geyeer quicksilver mine ie owned hy the following partiee: Flood & O'Brien, Pope and Talhot, W. S. Chapman, S. B. Boswell, Baker & Hamilton, Wilmerding & Kellogg, Hoyt & Seare, Edgar Mille, G. W. Gilhert, Albert Cresecy, Knox & Osborne, Stuert & Elder, M. Friedhurg. Superintendent Rhodo is working a force of sixty men. The Oakland company ie owned hy Shaw, Forman & Fraynor. Mr. Dennis is superintendent. The Sonoma mine, owned hy Dodge, Ralston and othere, is producing about forty fleeks a month. The parties in San Francisco to whom the Flagstaff was honded did not take the mine.

Lincoln Coal.—Mr. D. N. Coffin, the new superintendent of the Lincoln coal mine, tells the *Foothill Tidings* that the demand for this fuel is rapidly increaeing, and wherever introduced holds ite customers. Orders now come in from Marysville, Stockton, Merced and Vallejo, and at Sacramento, where it has heen in constant nee for eeveral mouthe, hundrede of familiee are converting their stovee into coal hurners and most of the steam hoilers will eoon he fed with this coal. They have over 50,000 toue opened, ready to take out, and will put on more force as fast as the increased consumption calls for it.

The employee in the five carpet mille knowu ae the Dohson Mills, at the falls of the Schuylkill river, near Philadelphia, nnmhering 1,700 persona, etruck last Friday on account of contemplated reduction of wages. Dohson intends to adhere to the intended reduction, and no resumption will he made nnlees the handa yield. The mills are the largest of the kiud in the United States, and their euspension will prohably have a serions effect.

Soft Ground.—Owing to the soft natnre of the gronnd at the 750-foot level in the Baltimore Consolidated mine, the timhere have heen cruehed to atoms within five feet of the face of the drift, and will cause a delay of several days. The water in the ehaft has decreased materially, and can now be handled hy the pumps.

Machinery.

BALL'S

SWEEPING DREDGE,

A NEW AND VALUABLE

CALIFORNIA INVENTION,

Has been very lately well proven by performing a job of dredging at the mouth of San Antonio Creek, at Oakland, Cal.

There is but this one machine that has ever had these improvements employed. It is an old machine, formerly built for another device, and is unfavorably constructed for Ball's improvements; yet this first temporary experimental machine has filled a scow of eighty-five cubic yards in sixteen minutes in unfavorable digging. For durability, digging hard material and fast work, it has a reputation (supported by leading engineers) as having no equal.

Testimonials and references will be given on application to the inventor, who is the sole owner of patente (excepting having made an assignment of the one machine now belonging to the Central Pacific Railroad Company). Having resolved not to sell any rights unless upon a *basis* of actual work performed by a machine built by myself for the purpose of fairly establishing the worth of the invention, I therefore offer to sell machines or rights on the following plan, which is warranting the capacity of the machine by actual work:

I will enter into an agreement with any responsible party to build and sell a machine, scows and tender, all complete, and right of all my improvements in dredging machines throughout the Pacific Coast for $20,000, warranting the machine to dredge six cubic yards per minute (to fill a scow at that rate). $20,000 will but little more than pay the cost of building the machine, scows, etc., all complete; therefore I am proposing to ask *nothing* for my patente unless my machine dredges more than six cubic yards per minute. But it shall be further agreed that in case (at a fair trial to be made within a stated time) the machine shall fill a scow at the rate of more than six cubic yards per minute, then $10,000 shall be added to the price above stated for each and every such additional cubic yard thus dredged per minute, and for additional fractions of a cubic yard thus dredged in the same ratio the $10,000 is to be added to said price above stated.

I will sell any other Territorial or State rights (either United States or Foreign) upon the same plan and at a lower price proportionately than the rights for the Pacific Coast.

I will sell a single machine with scows and all complete, and right to use the same in a limited territory, for $20,000 on the same plan as above stated, but will add only $2,000 to each additional yard over the six cubic yards per minute. Each machine is not to employ more than two 10x20 inch engines.

Payments to be made in U. S. gold coin on delivery of machine, as may be indicated by agreement.

Address, JOHN A. BALL,
9v28-tf Oakland.

Banking and Insurance.

The Pacific Mutual Life Insurance Company of California.

No. 41 Second street, - - - Sacramento.

ACCUMULATED FUND, NEARLY

$1,250,000.00.

$100,000 Approved Securities, deposited with the California State Department as security for Policy holders everywhere.

Miscellaneous.

ARE YOU GOING
TO PAINT?
THEN USE THE BEST.

THE AVERILL CHEMICAL PAINT

WILLLAST THREE TIMES AS LONG as the best lead and oil, without CHALKING; is of any desired color. It is prepared for immediate application, requiring no Oil, Thinner or Drier, and does not spoil by standing any length of time. It is equally as good for inside as outside work; over old work as well as new; in fact, where any paint can be used the AVERILL CHEMICAL PAINT will be found superior to any other. Any one can apply it who can use a brush, which truly makes it the FARMER'S FRIEND.

IT IS JUST THE PAINT FOR THE AGE.

IT IS SOLD BY THE GALLON ONLY.

One gallon covers 20 square yards 2 coats.

For further information send for sample card and price list.

New Mining Map of Utah,

Showing the boundaries of the principal mining districts, some 30 in number, adjacent to Salt Lake City. Price, pocket form, $2.50.

—ALSO—

Froiseth's New Map of Little Cottonwood Mining District and Vicinity.

Showing the location of some 400 mines and tunnel sites, together with the mines surveyed for U. S. Patent. Price $3. For sale and mailed to any part of the globe, on receipt of price, by A. L. BANCROFT & CO., A. ROMAN & CO., and LECOUNT BROS. & MANSUR, San Francisco. 10v26-tf

Mining Machinery.

THE

AMERICAN TURBINE WATER WHEEL.

ap25-tf

Recently improved and submitted to thorough scientific tests by James Emerson, showing the following useful effect of the power of the water utilized, being

THE HIGHEST RESULTS EVER KNOWN.

Parcentago of part gate, ¾ 50.08; ⅘ 69.64; ⅘ 78.73 ¾ 82.53; ⅞ 82.90. Percentage of whole gate, 83.14.

Mr. Emerson says: "These are the best average results ever given by any Turbine Wheel in my experience."

A splendidly illustrated descriptive catalogue, or any further information desired, furnished on application to

TEATS' PATENT FURNACE.

For Roasting, Desulphurizing, Chloridizing and Oxidizing Ores, etc. For the reduction of Gold, Silver, Lead and other ores, saving a larger percentage, at less cost, than any other invention now in use. Chloridizing Silver ore more thoroughly, in less time, with less fuel, salt and labor; also roasting Lead ore preparatory to smelting, better and cheaper than any other invention. The Furnace is so constructed that one man, of ordinary ability, tends five or more furnaces; controls them with ease; adding heat or air; stopping or starting at will; charging and discharging with ease. Also, Patent "Conveying Cooler," for conveying and cooling roasted ores, heating the water for amalgamation and the boilers at the same time. Saving the large space in mill (covered with brick or iron), and the labor of two men per day, exposed to the poisonous chlorine gases. Also, Patent Air Blast "Dry Kiln," for drying ores direct from the mine or breaker, saving fuel and labor heretofore necessary in drying ores for dry pulverizing. For description refer to MINING AND SCIENTIFIC PRESS, No. 18, October 31, 1874. For particulars address

TEATS & BREED,

No. 12 West Eighth Street, Cincinnati, Ohio

Circulars, &c., will be furnished, if required.

Varney's Patent Amalgamator.

These Machines Stand Unrivaled.

For rapidity pulverizing and amalgamating ores, they have no equal. No effort has been, or will be spared to have them constructed in the most perfect manner and of the great number now in operation, not one has ever required repairs. The constant and increasing demand for them is sufficient evidence of their merits.

They are constructed so as to apply steam directly into the pulp, or with steam bottoms, as desired.

This Amalgamator Operates as Follows:
